Electric Railway Journal

12634

Volume XLVI
July to December, 1915

McGraw Publishing Company, Inc.
239 West 39th St., New York City

- American Railways. (See Philadelphia, Pa.)
 American Society for Testing Materials:
 —Explanation of failure to agree with A. E. R. E. A. on trolley wire specifications, 62
 American Society of Mechanical Engineers:
 —Graphical presentation of data, standards for, 305
 —Threads for fixtures and fittings, standardization, 838
 —Winter meeting, 1176
 American Water Works & Electric Co. (See New York City.)
 Analysis of cost records, comment, 1
 Anderson, Ind.:
 —Union Traction Co. of Indiana:
 Claims statistics standardization [Slick], *813; Comment, 792
 Depreciation and appreciation, practices in allowing for [Forse], 1169
 Safety magazine [Slick], *274
 Spacing steel ties [Mitchell], 1266
 Annapolis, Md.:
 —Annapolis Short Line:
 Station surroundings, improving, *187
 Trolley wire and pantograph shoe wear [Crouse], *638
 Anniston, Ala.:
 —Alabama Power Co.:
 One-man car operation, closed cars rebuilt for [Kenyon], 1035
 Anthony N. Brady, memorial medal, 23
 Appraisal of railway property:
 —Bay State Street Ry., 1121
 —Conference on valuation, 991
 —Detroit United Ry., 923
 —Funds for appraisal, offer to advance, Puget Sound Traction, Light & Power Co., 840
 —Minneapolis Street Ry., 417
 —Original cost in valuation work, Comment, 1020
 —Valuation of public service commission, company's brief, Portland Railway, Light & Power Co., 922
 —Valuation conference, Interstate Commerce Commission, 676, 1031
 —Valuation, Foundation principles [Arnold], *713, *803; Comment, 698
 Arbitration. (See Strikes and Arbitrations.)
 Ardmore, Okla.:
 —Ardmore Electric Ry.:
 Property to be sold, 1056
 Asbestos production in 1914, United States, 403
 Atlanta, Ga.:
 —Atlanta Northern Ry.:
 Fare reduction for children denied by commission, 468
 —Near-side stop ordinance passed, 1280
 Atlantic City, N. J.:
 —Atlantic City & Shore R.R.:
 Arrangements for testing electrical equipment [Faber], *24
 Motor overhauling [Faber], *677
 Open-car reconstruction [Faber], *110
 Receivership, caused by jitney competition, 1142; Comment, 1105
 Atlantic Shore Ry. (See Kennebunk, Me.)
 Augusta, Ga.:
 —Augusta-Aiken Ry. & Electric Corp.:
 Annual report, 647
 Fare increase granted, 423
 Aurora, Elgin & Chicago R.R. (See Wheaton, Ill.)
 Australia:
 —One-man car operation in various cities, experiences with, 1112
 —New South Wales:
 Government Rys. & Tramways:
 Annual report, 926
 —Sydney:
 Electrification projects, 1037
 Austria:
 —Vienna:
 Overhead construction, Vienna-Pressburg electrification [Seefehlner], c 593
 Automatic substations. (See Substations and equipment.)
 Automobiles:
 —Accidents, conference on, 1012
 —Competition with steam and electric railways, Comment, 938
 —Effect on street car travel [Beeler], c 590; Comment, 577
 —Influence on Denver traffic, *309; Comment, 301
 —Producer of hard times [Beeler], c 1125
 —Reckless driving, Comment, 979
 Auto-train at Panama-Pacific exposition, 581
 Axles (See Wheels and axles)
- B**
- Ball bearings, Effect on speed and operating cost [Farr], *239
 Baltimore & Ohio Railroad:
 —Train operation by signals alone, *434
 Baltimore, Md.:
 —United Rys. & Electric Co.:
 Equipment improvements, Recommendation for, 1139; company's reply, 1229
 Motor-bus line established by company, 207
 Bangor, Pa.:
 —Bangor & Portland Tr. Co.:
 Merger with Northampton Tr. Co. approved, 1277
 Bangor & Aroostook Railroad:
 —New electric railway, Agreement with Maine Central R.R. to build, 1007
 Bascule bridge, Double-leaf, Method of installing trolley wire [Foster], *1042
 Bay State Street Ry. (See Boston, Mass.)
 Beaver Valley Traction Co. (See New Brighton, Pa.)
 Berkshire Street Ry. (See Pittsfield, Mass.)
 Binghamton, N. Y.:
 —Binghamton Ry.:
 All-steel cars for city service, *1269
 Birmingham, Ala.:
 —Birmingham, Ensley & Bessemer R.R.:
 Reorganization plan adopted, 688
 Birmingham-Tuscaloosa Ry. & Utilities Co. (See Tuscaloosa, Ala.)
 Blue Hill Street Ry. (See Canton, Mass.)
 Boilers and equipment:
 —Air intakes increase furnace capacity, *641
 —Feed water, Equipment for testing [Crumley], *152
 —Feed-water recorder [Hopkes Mfg. Co.], *242
 —Fusible plugs, Deterioration, 1002
 —Recorder for measuring boiler feed water (Harrison Safety Boiler Works), *284
 —Silica-graphite paint for boilers, Economy in using, 195
 —Valves, Double-cushioned non-return (Golden-Anderson Valve Spec. Co.), *838
 Boise, Idaho:
 —Idaho Traction Co.:
 Boise Railroad to be returned to former owners, 249
 Fare increase allowed, 128
 —Boise Railroad:
 Segregation from Idaho Traction Co., 249
 Transfer controversy, 335, 423, 652
 Boston, Mass.:
 —Bay State Street Ry.:
 All-service, combination car, Body equipment details, *854; Comment, 853;
 Electrical and mechanical equipment, *1068
 Annual report, 1187
 Cost of shop equipment, 1173
 Employees pass resolution condemning arbitration award, 119
 Equipment department organization, *671; Comment, 659
 Fare increase petition, 468, 891; Comment, 427; Hearings, 692, 1006, 1052, 1121; Commission declares its jurisdiction, 1279
 Passenger department's new offices, *406
 Power station organization, 911
 Roadway machinery and tools, Cost, 1227
 Vacuum-cleaning car [Haines], *323
 Valuation of property to support fare increase application, 1121
 Way organization, 229
 —Boston Elevated Railway:
 Advertising by display of scenes on converted car, 109, *149
 Annual report, 1008
 Arbitration board refuses to reopen wage case, 120
 Card index, Value in claim work [Reynolds], *815
 Carhouse destroyed by fire, 966
 Company library, Methods of developing and indexing, 1118
 Dividend rate maintained, 249
 Handling traffic at baseball park, *621
 Safety features and recommendations for elevated lines, 159
 Transfer abuses, Hearing, 1278
 Transportation of troops, Co-operation with government [Bancroft], c 1125
 —Street railway conditions compared with Glasgow [Gordon], 443
 —Transit commission, Annual report, 965
 —Boston & Worcester Street Ry.:
 Wage increase for employees, 1013
 Brakes:
 —Air-brake apparatus, Outfit for testing [Parsons], *1128
 —Air-brake hose coupling (National Hose Coupling Co.), *194
 —Air compressor for light-weight, low-floor cars (National Brake & Elec. Co.), *681
 —Brakeshoe record, Oregon Electric Ry. [Clough], *555
 —Electro-pneumatic brake, Details, Pennsylvania R.R.; Philadelphia Paoli electrification, *981
 —Full-flanged brakeshoes, Results with, Southern Pacific Co. [Hewitt], 1223
 —Hand-brake pressures [Greenough], c *276; [Horne], *77, c 277
 —Heavy duty on a geared brake, Northampton Tr. Co., *1047
 —Minimum car weights suitable for clasp brakes, Comment, 47
 —Pipe joints, Insulating, for air-brake equipment (MacAllen Co.), *411
 —Semi-automatic, to stop cars, Patent to motorman, Cairo Electric & Traction Co., 838
 —Slack take-up device for adjusting air-brake piston travel (Johns-Manville Co.), *921
- Bridges:**
 —Apportionment of costs between street railways and cities [Spofford], 53
 —Reinforced concrete viaduct in Kansas City, 633
 —Subway approach recommended for Cleveland bridge, 461
 —Traffic data for bridges in London [Spofford], 53
 —Traffic in New York City, 167
 British Columbia Electric Ry. (See Vancouver, Can.)
 Brooklyn Institute for Safety:
 —Safety work in schools and at playgrounds, 691
 Brooklyn, N. Y.:
 —Brooklyn, Queens County & Suburban R.R.:
 Revenue tax case, Favorable decision, 776
 —Brooklyn Rapid Transit Co.:
 Annual report, 203
 Car-capacity order by health board in effect again, 971
 Center-entrance car operation [Gove], 14, 19
 Crossing special work [Williams], *678
 Curved heads for girder rails to reduce corrugation [Cram], *1246; Comment, 1245
 Elevated track relocation, Committee report, 925
 First-aid equipment, 651
 Fresh-air cars, 1059
 Girder and high T-rail renewals [Cram], c 873
 Group insurance plan, 610
 Increased rent for operating over Williamsburg bridge proposed, 1140
 Indictment of superintendent for failure to comply with commission order, 1052
 Mechanical department, Organization progress, 826
 Metal poles, Reinforcing [McKelway], *365
 Surface line organizations make safety report, 84
 Time lost by employees reduced by medical examinations, 652
 Tongue switch for special work [Williams], *639
 Track-laying for elevated railway, Contract approved, 201
 Track layout at yard entrance [Striezhoff], *876
 Training school for employees, *344; Comment, 343
 Water pipes crossing over trolley wires [McKelway], *770
 —Safety campaign by Brooklyn Institution for Safety, 1059
 Buffalo, Lockport & Rochester Ry. (See Rochester, N. Y.)
 Buffalo, N. Y.:
 —Buffalo & Depew Ry.:
 Strike, 1095, 1186, 1232
 —Buffalo & Lake Erie Tr. Co.:
 Foreclosure suit, Referee appointed, 1276
 —International Ry.:
 Accident in Niagara Gorge, 126, 252, 468
 Insufficiency of the 5-cent fare [Connette], 18; Discussion, 15
 Freight interchange with New York Central, 783, 972
 New York jitney-bus law [Connette], c 21
 Service and equipment improvements, 1230
 Two-car train operation during rush-hours, 971
 —Wellsville & Buffalo Railroad:
 Incorporation, 1235
 Buffalo & Susquehanna Railroad:
 —Property bought by syndicate, 1188
 Burlington (Vt.) Traction Co.:
 —Convertible cars (Jones), *71
 Butte, Anaconda & Pacific Ry.:
 —Contact systems, Construction and maintenance [Cox], *59
- C**
- Cables:
 —Combination insulator and splicing sleeve (Drew Electric & Mfg. Co.), *114
 —Feeder grip, Quickly adjustable (Mathias Klein & Sons), *680
 —Fiber ducts for feeder cables at Worcester (Fibre Conduit Co.), *1182
 —Flexible support for lead-covered cables (Transit Development Co.), *600
 —One-piece splicer for feeder cables, United Railroads of San Francisco [Foster], *955
 —Preventing kinks in handling coils of wire [Koppel], *66
 —Testing insulation, method, 1227
 Cairo, Ill.:
 —Cairo Electric & Traction Co.:
 Brake, Semi-automatic, to stop cars, Patent to motorman, 838
 California:
 —Commission jurisdiction enlarged, 285
 —Motor-bus freight business declining, 846
 Comment, 851
- (Abbreviations: * Illustrated. c Correspondence.)

- Calgary, Canada:
—Calgary Municipal Ry.:
Employees purchase machine gun, 600
- Canada:
—Hydroelectric Power Commission of Ontario,
Plans, 863, 965
—(See also various cities)
- Canadian Electric Railway Association:
—Annual meeting, 108
- Canton, Mass.:
—Blue Hill Street Ry.:
Fare increase granted by Massachusetts
commission, *226; Comment, 215
- Capacity of single track, Analysis, Railway Sig-
nal Association, 580
- Capital Traction Company (See Washington,
D. C.)
- Car design:
—Avoiding inaccuracies in street car building,
Comment, 1067
—Detailed weights of equipment for Bay State
car, 1071
—End-entrance cars, converting open cars
into [Colby], *451
—High-speed cars without center sills, Chicago
& Milwaukee Ry., *388
—Improved equipment [Stucki], 625
—Light-weight, Status of ["Manager"], c 238
—Method of determining body size, Empire
United Rys., *578
—Reinforcing high-speed interurban cars,
Aurora, Elgin & Chicago R. R. [Bow-
man], *1221
—Sectional interior arrangement for separat-
ing passengers into groups, *26
—Standards as a remedy for cars at less than
cost, Comment, 378; [Gonzenbach],
c447; [Storer], c635, Comment, 615
—Standards difficult to establish ["Transporta-
tion Man"], 914
—Steel car, Slight damage in collision, *405
—Step height ordered reduced in Portland,
Ore., 468
—Ultra light weight [Lambert], c402
- Car development [Stucki], 625
- Card records in track work, Method of indexing
[Campbell], *407
- Carhouses and yards:
—Storage yards and operating stations at
Cleveland, *356
- Cars:
—All-service, Combination, Bay State Street
Ry., Equipment, *854; Comment, 853;
Body framing and electrical and me-
chanical equipment, *1068
—Center-entrance, Reconstructed from open
car, Atlantic City [Faber], 110
—Double-deck (See Double-deck cars)
—Improvements in low-floor type, Pittsburgh,
*4
—Metropolitan Street Ry. [Weber], *771
—One-man (See One-man cars)
—Refrigerator, Detroit United Ry. [Keller],
*1044
—Remodeled interurban, Compact seating ar-
rangement, Milwaukee Electric Ry. & Lt.
Co., *834
—Semi-steel, Empire United Rys., *578
—Single-truck, center-entrance, low-floor type
at Glens Falls, N. Y. (Laconia Car Co.),
*1226
—Steel:
Binghamton Ry., *1269
Center-entrance, Washington - Virginia
Ry., *282
Chicago & Milwaukee Electric Ry., *388
Cleveland & Eastern Traction Co., *30
Limited, local and express and freight,
Details, Michigan Ry., *1154
London & Port Stanley Ry., *27
Pacific Electric Ry. [Small], *489
—Trailers, All-steel, light-weight, Long Island
R. R., *136
- Cars at less than cost (See Car design: Stand-
ards)
- Catenary construction (See Overhead contact
system)
- Cedar Rapids, Iowa:
—Iowa Ry. & Lt. Co.:
Service in Iowa City, Arrangements for,
926
- Cement-sack-cleaning machine, Savings effected,
Cleveland Ry., 772
- Central Electric Railway Accountants' Associa-
tion:
—Meeting:
President's address [Cavanaugh] and
papers [Kasemeier], 1168; [Ded-
rick], 1169; [Forse], 1169; [Jacobs],
1213
- Central Electric Railway Association:
—Increasing passenger traffic by advertising,
Comment, 1245
—November meeting:
Proceedings, committee reports and
papers, 1039, *1075
—Repair charges to foreign equipment, Com-
mittee report, 1079
- Charleston, S. C.:
—Charleston Consolidated Ry.:
Employees differences submitted to arbi-
tration, 1187; Decision rendered,
1274
- Charleston, W. Va.:
—Jitney discrimination cases dismissed, 610
- Charlotte, N. C.:
—Southern Public Utilities Co.:
Track construction, Reinforced concrete
beam [Horton], *324, Comment, 299
Charts as exhibits in wage dispute arbitrations,
*664; Comment, 657
- Chicago:
—Arbitration hearings between railways and
employees, 75, 146; Comment, 133, 135;
Summary of award, 118
—Board of Supervising Engineers:
Comments on effect of gear ratio on
operating economy, *68
Energy cost, Increase in, for rush-hour
service, 138; Correction, 190; Com-
ment, 173
—Chicago Surface Lines:
Advertising campaign, *823
Advertising campaign to be investigated
by city, 1053
Club meeting, 1214
Energy cost and load factor, Analysis,
138; Comment, 173; Correction, 190
Fresh-air car service, 1100, 1237
Jurisdiction dispute between city and
Illinois utilities commission, 890,
931, 971, 1146, 1236
President's salary approved by city
council, 1140
Regulation of electric railways by com-
missions, Factors involved [Busby],
1081
Safety lectures, *267
Service order, Illinois utilities commis-
sion, 775
Skip-stop test planned, 168
Standing vehicles in loop district, Re-
moval urged, 1279
Statement regarding strike, 35
Vehicular interference, 971; Publicity to
eliminate, 1192
Wage dispute, 34, 246, 884, 923, 966
—Consolidation of surface and elevated lines,
Proposed, 1050
—Elevated Railroads:
Accounting for rents [McRae], c 1260
Annual report, 1141, 1233
Employees, Physical and mental exami-
nation of [Fisher], *216; Comment,
213
Energy consumption reduced through
training employees, 391
First-aid system and equipment [Fisher],
430
"Fresh-air" cars put in operation, 971
Safety measures for train operator, *302
Safety record for ten years, 932
Wage dispute, 34, 246, 884, 923, 966
Yellow journalism, Disarmed with facts,
Comment, 343
—Elgin & Belvidere Electric Ry.:
Substations, Automatically controlled
[Allen and Taylor], *583; Com-
ment, 575, 576; Savings [Davis],
772
—Metropolitan West Side Elevated Ry.:
Gears and pinions, Specifications for
[Johnson], c189
—Middle West Utilities Company:
Annual report, 37
—Subway construction urged by Mayor, 778
—Terminal electrification and smoke abate-
ment:
Forecast of report, 286, 964
Report of committee, *1113, 1138; Com-
ment, 1106; [Smith], c 1216; Esti-
mated costs, *1159; Comment, 1153;
[Goss], 1272
Report ignored by city council, New
committee appointed, 1185
—Traction consolidation commission, Ordi-
nance authorizing creation, 1138, 1273
—Traffic count of vehicles, 632
—Subway construction proposed by Mayor,
329
—West Side Elevated R. R.:
Top-contact unprotected third-rail
[Jones], *55
Chicago & Joliet Electric Ry. (See Joliet, Ill.)
Chicago, Lake Shore & South Bend Ry. (See
Michigan City, Ind.)
Chicago & Milwaukee Electric Ry. (See High-
land, Ill.)
Chicago, Milwaukee & St. Paul Ry.:
—Electrified division, Operation to begin Dec.
8, 1137
—Locomotive:
Electric, Exhibition of, *1036
Mileage, Effect of electrification, Com-
ment, 1066
Tests on electrified division, 1175, *1215
—Signal system for electrified section, 605
—Substations, Location and equipment, *794
Chicago, Ottawa & Peoria Ry. (See Joliet, Ill.)
Chicago, South Bend & Northern Indiana Ry.
(See South Bend, Ind.)
- Chico, Cal.:
—Northern Electric Ry.:
Reorganization plans, Preliminary, 80;
Details, 886
- Chile, S. A.:
—Concepcion:
Catalogs wanted by Compañia Electrica
de Concepcion [Thomas], c403
- China:
—Canton:
Street railway proposed, 188
- China: (Continued)
—Shanghai:
Trackless trolley operation resumed,
642
Choctaw Ry. & Lighting Co. (See McAlester,
Okla.)
Cincinnati, Bluffton & Chicago R. R.:
Reorganized under the name of Hunt-
ington, Bluffton & Portland R. R.,
289
Cincinnati, Dayton & Toledo Tr. Co. (See Ham-
ilton, Ohio)
Cincinnati, Ohio:
—Columbus, Delaware & Marion Ry.:
Track relocation, Opinion by State at-
torney-general, 776
—"Experience ordinance" passed governing
strike employment, Provisions, 890;
Comment, 895
—Interurban Ry. & Term. Co.:
Fare decision unfavorable to company,
1146
—Municipal line recommended, 78
—Rapid transit route adopted, 1271
—Transit commission:
Appointed by mayor, 1094
Organized, 1138
—West End Rapid Transit Co.:
Franchise for extension, Application to
City Council, 646
New line to be built, 461
City Electric Co. (See Albuquerque, N. M.)
City service for village traffic, Comment, 427
Claims Association:
—Convention:
Papers [Hare], 812; [Bennett], 813;
[Slick], 813; [Reynolds], *815;
[Dixon], 818; [Boynton], 819;
[Harrison], 820; [Warnock], 820
President's address [Tichenor], 811
Program, 363
Proceedings, 767
—Problems of the association, Comment, 792
- Cleaning of cars:
—Vacuum cleaning car, Bay State Street Ry.
[Haines], *323
—Vacuum system used in San Francisco
[Allen], *516
Clearances for future railway construction fixed
by Illinois utilities commission, *228
Cleveland & Erie Ry. (See Girard, Pa.)
Cleveland, Ohio:
—Cleveland, Akron & Canton Terminal R. R.:
Subway franchise, 119, 247, 416, 882,
963
—Cleveland & Eastern Traction Co.:
Steel car, light weight, *30
—Cleveland & Ohio Central Electric Ry.:
Proposed route, Changes in, 286
—Cleveland Ry.:
Crossing installation, *1133
Cement-sack-cleaning machine, 772
Fare franchise in Lakewood, company
plans to operate under, 1005
Free use of proposed subways, 416
Municipal ownership ordinance, 462,
686, 924, 963
Operating, interest and maintenance
funds, Report asked by council, 1232
Paving dispute, Suit filed by city, 964
PLOW to tear up pavement, *73
Rail bonds, Application by electric braz-
ing [Creelius], *236
Shop-order system for car rehabilitation
[Jacobs], 1214
Storage bins, Steel, for coal and sand,
*1001
Storage yards and operating stations,
*356
Ties, Steel twin, on Brooklyn-Brighton
Bridge, *834
—Cleveland, Southwestern & Columbus Ry.:
Electrolysis ordinance suit withdrawn,
161
Freight service at night planned, 422
Steel vs. wood ties in city track con-
struction, Comparative cost [Nes-
ter], *1089
—Cleveland & Youngstown R. R.:
Franchise for freight terminal, 35, 119,
161, 247, 461, 882, 963
—Smoke abatement report, 604
—Subway approach recommended for new
bridge, 461; Plans submitted, 1271
—Traction matters, 840
Coal and ash-handling apparatus, Springfield Ry.,
*898
Coal production in Pennsylvania, Bituminous, 284
Coasting (See Energy consumption)
Coasting, Effect on running time, Comment, 299
Coffeyville, Kan.:
—Union Traction Co.:
Locomotive-express car, Details, *995
- Colorado Electric Light, Power & Railway Associa-
tion:
—Annual meeting, 826
- Columbia, S. C.:
—Columbia Ry., Gas & Electric Co.:
Strike ended, 645
- Columbus, Delaware & Marion Ry. (See Cincin-
nati, Ohio)
Columbus, Ohio:
—Columbus Ry., Power & Light Co.:
Accounting review [Burlington], *720
Steel tie, solid concrete track construc-
tion [Ackerman], *956
Transfer abuses, Attempt to correct,
1192

(Abbreviations: * Illustrated. c Correspondence.)

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.

Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK, SATURDAY JULY 3, 1915

No. 1

A GOOD EXAMPLE OF CO-OPERATION

The National Fire Protection Association is a body whose interests might seem to conflict with those of electric railways and other sources of insurance risks. The insurance people naturally want to get the largest possible premiums for insuring property involving the least possible fire hazards. The larger the premiums and the fewer and slighter the fires the more the insurance profits. While, of course, electric railways do not desire to have their structures unduly hazardous from the fire standpoint, yet they do not enjoy dictation from the underwriters. There is, therefore, a constant possibility of difference of opinion as to what constitutes a reasonable risk and what payments should be made for carrying it. The Fire Protection Association is under no obligation even to consult the railways in this matter and it is all the more gratifying, therefore, that they not only do call representative electric railway men into conference, but they accept the suggestions of these men. Such conferences as those held in New York and Boston within the last two months achieve results which could not possibly come from conflict and produce benefits far beyond those originally contemplated. So conspicuous has been the success of co-operation in this instance that the following words appeared in a recent N. F. P. A. committee report: "The association (A. E. R. E. A.) has displayed a spirit of strong co-operation in harmony with the National Fire Protection Association in all matters affecting mutual interest, and friendly relations exist at the present time."

ENGINEERS NEED WAY COST RECORDS

Maintenance cost records founded on a standard unit should form the basis for analyzing the relative values of way materials and types of construction. The records of most way departments indicate that information about materials, the types of construction and the track locations are carefully and accurately kept. Beyond this point most engineers have hesitated to go. They are prone to look upon analytical statistics as a prodigious task, which reveal only what comes more quickly from experience. However, we wish only to call attention to the wonderful improvements that have been made possible by the performance records and costs of generating stations and repair shops. It is only by analyzing costs on a common unit basis that results may be compared on different properties. What is still more important, definite knowledge is available which shows whether the new materials or the new types of construction used have produced the expected results. Information of this kind would be especially valuable

in analyzing the merits of different types of construction and materials used in track in paved streets. Generally speaking, the track cost represents approximately 40 per cent of the total plant cost, therefore the way engineer must exercise most careful judgment in adopting new types of construction and new kinds of materials. So many years are required on most properties to obtain definite results that some basis of generally adopted comparison is all the more important. If this were done, track worn out under dense and heavy traffic would serve as an index of what might be expected of track where comparatively light traffic obtains. To what length way-department cost records could be extended we do not care even to suggest. We do believe, however, that cost records on a unit basis of the total tonnage passing over the track would be of incalculable value in making comparisons between the different types of materials and construction. It would permit engineers to analyze their maintenance methods and particularly to criticise their own work. Where the same type of track construction is under similar traffic, maintenance costs on different properties could be compared.

GREATER PROTECTION FOR COMMISSIONERS

We hope that the New York Constitutional Convention will adopt the recommendation made by representatives of public utility companies who appeared before the members last week and urged that the term of office of public service commissioners be extended from five to ten years and that the holders of such offices have constitutional protection. We have often emphasized the fact that the tenure of office of commissioners is too short for them to become properly acquainted with the questions to be solved and the precedence and the economic laws governing these public utility problems. A term of fifteen years would not be too long, but a practical fulfillment of the ten-year term for New York would be a step in the right direction. As to the other point, up to the present there has been very little advocacy of constitutional protection for commissioners. The reason for this has been the comparative newness of the idea of commission regulation. Changes in constitutions come slowly in this country, and it is well that it is so. Public sentiment has gradually been crystallizing, however, in favor of commission form of government, but so separated from politics as to keep it free from the spoils system. We would approve, therefore, any means for giving commissioners the same security of office as the higher judges, and would advocate a requirement of a concurrent resolution of both legislative houses by a two-thirds vote for removal. To be sure, the character of commissioners must

ultimately depend upon the Governor's appointive power, but under the above plan the individual commissioner would be much more secure in office, and so better able to act in an unbiased way with the cases which come before him. For the same reason, also, a better class of men would be attracted to such work.

JITNEY-BUS COMPETITION

We are wholly unable to agree with the expression of belief in the importance of the motor-bus as a competitor to the electric railway, which appears on another page of this issue, notwithstanding our respect for the opinions of its author. Undoubtedly the itinerant jitney has made serious holes in the gross earnings of a number of properties, but that fact certainly does not constitute a valid reason why the electric railway should enter the bus business with a view to recouping its losses. We have followed with the utmost care—even with a certain amount of natural anxiety—the whole of the short history of the motor-bus movement in this country, and as it stands at present the situation may be summed up in one sentence: Nowhere have there been given out any authentic records of the actual operation of motor-buses which show them to be nearly as efficient, including all costs and all factors, as are electric cars.

The author expresses fear that organized capital might engage in the business and make greater inroads into the trolley receipts than the unorganized jitney competition, but there is even less danger of this, we believe, than from the itinerant jitney. The regular bus is at a disadvantage in some respects as a traffic getter, compared with the second-hand touring car. In the first place, with the increased number of passengers more stops have to be made, and the bus cannot compete in speed with the smaller vehicle. Again, the bus does not appeal so strongly to the man who does not own an automobile as does the touring car. We have always maintained that one of the reasons which impelled some people to use the jitneys was the appearance of affluence which it gave, and this is shown by the requests often made by passengers to the driver to remove his route sign. Finally, there is no such supply of second-hand motor-buses as there is of second-hand touring cars, so that the investment required to establish a line of buses is very much greater.

Organized capital has attempted to establish 5-cent motor-bus lines in various cities, but we know of no place where they have proved at all successful. In both Pittsburgh and Los Angeles the service has been abandoned, and last week the news came from Washington that a receiver had been appointed for the Metropolitan Coach Company of that city. Of these installations it is hard to imagine any two cities in the country where the natural conditions in the way of climate, low grades and good paving are more favorable to the operation of motor-bus lines than Los Angeles and Washington.

The sale of the Los Angeles buses was mentioned in this paper several months ago. In reply to a creditor's petition for a receiver in the Washington case the com-

pany admitted its insolvency. It has never made expenses at any time during three years of operation. It was not a fly-by-night undertaking equipped with second-hand cars. It was a company operating six eighteen-passenger buses of good design over a route from Fifteenth Street and Pennsylvania Avenue (a departmental, business and hotel center) to Sixteenth and U Streets, traversing one of the best residence districts of the city. The maximum haul for a 5-cent or six-for-a-quarter fare was $1\frac{1}{2}$ miles. The traffic has amounted to as many as 65,000 cash passengers a month. But the line could not be made to pay even with the most economical, not to say parsimonious, management. There is no mystery about the outcome of this experiment. It is due simply to the fact that it cost more to carry passengers than was collected for the service. What makes the Washington bus failure especially impressive is the fact that the enterprise was well backed financially and had a particularly good route. If success could not be achieved under these circumstances it would be hard to find a situation that would justify the hope of profit in jitney operation.

There is a profitable bus line in New York City. But this charges a 10-cent fare in a restricted and highly-profitable territory, and if there is another successful city bus company of reasonable size elsewhere in the country, the fact of its existence has never been published. Indeed, until someone is able to make actual, not paper, profits with buses at the 5-cent fare charged by city railways, or to serve rural districts at the same speeds and at the same fares that have been established by the interurbans, we refuse absolutely to be stampeded by the spectacular features of the motor-bus. When its advocates can point to definite results that show it to be cheaper to operate than the electric car there may be some grounds for the consideration of bus operation in general by electric railways. Until that time arrives, however, we can only reiterate a warning against taking up this over-exploited and apparently extravagant method of transporting passengers.

THE JITNEY AND THE ONE-MAN CAR

It is perhaps more than a coincidence that we printed in last week's issue two letters from railway operators advocating the use of light one-man cars as a means for dealing with the jitney problem in small cities. The jitney has certainly shown the general demand for frequent service, and in emphasizing this fact it may prove to be a blessing in disguise. As a common carrier, it has no place on the streets of the city unless it assumes the duties which pertain to all common carriers, but that it may also direct attention to ways in which electric railway service may be improved, there is no question.

Two plans have been suggested for changes in electric railway practice to meet the competition brought by the jitney. One is the adoption of the short car which, in many cities, would be the one-man car. The second, mentioned in one of the letters last week, is the establishment of a zone system with a reduced rate

of fare for a restricted zone in the center of the city. The British Columbia Electric Railway is the only company we now recall as having taken this latter step. This line, preferring to apply the "aut scissors aut nullus" policy to its fares rather than to its service, recently offered as alternative to its ordinary straight 5-cent fare a special non-transfer ticket, good only within the city limits of Vancouver and Victoria, at the rate of eight tickets for 25 cents. In the recent report of R. B. Stearns on the Milwaukee zone system the suggestion was also made, though not yet put into practice, that a reduced rate for a smaller central zone would further increase riding through the stimulation of short-haul business and through the competition with the jitney and walking. Such a step would undoubtedly be revolutionary, but these suggestions show the way in which a number of railway operators are thinking.

The one-man car, especially the light car, is not so radical a departure from existing standards, and in one of the letters mentioned actual figures were given of the low injuries and damages account on two lines using one-man cars, as well as estimated annual net savings possible with one-man over two-man service. Operators and public officials inclined to regard the accident hazard of the one-man car as prohibitory will find a revelation in these figures, and general publicity of similar statistics would do much to remove prejudice from this type of equipment. So far as its inherent profitability is concerned, the fact that a number of engineers are now engaged in designing experimental one-man cars of exceptionally light weight bids fair to promise for the future a considerable reduction in operating expenses, even as compared with the roseate yet conservative estimates already presented.

THE CALL OF THE RAIL

To graduates of engineering schools this year who are considering electric railway work as a chosen field, we unhesitatingly say that never in the history of the industry have opportunities been better for men with a real bent toward a transportation career, backed by staying power and a determination to do every job so well that it forms a stepping stone toward the next responsibility. The day has gone when a "favorite son" with a fat allowance and an easygoing disposition can expect to go into electric railway work and hold down a man's position on a banking hours' schedule; but the time will never come when a man willing to devote practically his whole time out of bed to mastering the problems of transportation in the early years of his career on the basis of aptitude for the work and of absolute fidelity to every commission cannot advance in the traction world once he is fortunate enough to get a start.

Once the 1915 graduate becomes an employee of an operating company, let him realize that his future largely depends upon himself. The exact line of work which is first taken up is relatively unimportant. Students sometimes hesitate to enter platform service for fear that they will be swallowed up in the organization, but it is fair to say that this anxiety is largely unnecessary.

A period of service at the controller and among passengers affords a trained engineer opportunity to enter into the problems of the transportation department which may be extremely valuable in comparison with the rather academic ideas often gained otherwise. The methods of handling runs, of filling in traffic blanks, day cards, and accident reports, of "signing up" for work, the close observation possible of the way in which subordinate officials perform their tasks—these and a hundred other details afford experience which may be extremely suggestive, however loath a man may be to pass more than a few months in routine duty. In years to come, when the executive of 1925 goes under cross-examination in an arbitration or court case, the mere fact of having had actual experience on the platform or as a helper in the shop may give his evidence a value which could never be the result of purely theoretical knowledge. Work in the ranks of an operating company may not in itself call for the practice of principles learned on the hidden side of the college wall, but it gives a sense of proportion and a knowledge of men that come into play exceedingly well sooner or later.

However a technically trained man may enter the service of the modern street railway, he is bound to become acquainted with the engineering and executive staff in due course and, in fact, will do well to let the employment department know his full hopes and desires when he goes into the work. Attendance at meetings of company sections of the national association, the gradual extension of friendship and continued study are likely to bring their reward in due course. Where one can enter a student course or as a recognized apprentice, so much the better. Finally, if things go too slowly after a reasonable trial, it may be possible to apply for a transfer to another department with some show of success. Sooner or later the opportunity coveted is almost sure to come to the technically trained man whose qualifications are known to his superiors, and if they are not, either the system of employment and management is wrong or the man himself must be at fault.

Sooner or later the true cost of electric transportation must be met by the communities which it supplies. This means that as long as such service is rendered, scientific work in it will be rewarded. We need not enumerate the unsolved problems of the industry. There will always be such before it, and to those of the future the young men of to-day will have to address themselves. Public relations, scientific management, the conduct of labor affairs,—these and many other questions are coming to the front more and more as the industry grows. Methods may change with the years, but the fundamental problem of economically transporting men and things will always be with us, and in no small degree the success with which its variables are evaluated in the years to come will depend upon the graduates of the present period, upon their eagerness to master details before they attempt to generalize, and upon their appreciation of the meaning of opportunity in the humblest task which is placed upon them in the drab weeks which so often follow the fall of the academic curtain.

Improvements in the Low-Floor Car

Four Years of Development Have Brought the Pittsburgh Design into Its Probable Final Form—A Description is Published, Including Consideration of the Details of Construction of the Low-Floor Motors and the Control Without Resistance

Since the low-floor car was brought out in Pittsburgh, somewhat less than four years ago, certain changes have been made from time to time with the idea of improving the operating efficiency. The first cars of this general type were trailers and were placed in service in 1911. One of these, equipped with motors, has been in regular operation since the summer of 1912, but the first cars designed especially for use as motor cars have been in use about two years. The changes in the car body, although important, are very naturally overshadowed by those made in the control system that practically eliminates the use of resistance, as well as by the motors which have made possible such an astonishing reduction in weight by permitting the use of 24-in. wheels. As these features have, in all probability, reached the commercial form in which they will remain for some time to come, detailed descriptions are given in the following paragraphs. These include also a comparison between the design of the low-floor motor and a standard motor of the same rating, which shows for the first time some of the reasons for the ability of the former to do its work in spite of its small size.

The latest developments in the low-floor car design appear in the 100 cars which were ordered some time ago by the Pittsburgh Railways Company and are being received from the builders at the present time. In general appearance the new cars are like their predecessors which were described in the *ELECTRIC RAILWAY JOURNAL* for April 11, 1914. However, they have lower steps because of a greater ramp in the floor, and in addition a greater proportion of the car is built from steel, the latter feature, together with other refinements in design, making it possible to reduce the weight of the car body by approximately 2500 lb.

In the center-entrance motor cars first used in Pittsburgh the top of the center door is reinforced by heavy rolled channels. In the new cars, however, the whole side of the car becomes a girder, the depth of which is from the top of the letterboard to the bottom of the side sheathing. Previously the side girder extended

from the bottom of the side sheathing to the bottom of the window only, and it was necessary to reinforce heavily the parts around the center doors in order to carry the strains across this portion of the car side.

The seating capacity is sixty. By combining longitudinal and transverse seats the company has returned to a plan that was very widely used in Pittsburgh before the advent of the first center-entrance cars. Permanent seats extend around the ends of the car, the control and brake handles being mounted on pipe railings that serve as seat separators. A plan is shown on page 7.

The ramp at the center of the car is 5 in. high and 5 ft. long. This reduces the two center-entrance steps to heights of 14 in. and 9½ in. Three steps respectively 12½ in., 8½ in. and 8½ in. are provided at the front exit, the first-mentioned one being the height from the rail to the lowest step tread.

In common with the earlier designs the new cars have a front exit door and two doors at the center. The door mechanism is made up of levers, and all doors are mechanically controlled by the trainmen without the use of compressed air or electricity, it being believed that a manually-operated door is much more easily kept in order than one opened by power. The center doors are separately controlled by the conductor, so that either one or both of these doors may be used as an entrance. If a passenger sitting in the rear part of the car signals that he wants to get off, the conductor keeps the rear center door closed until he is ready to alight. The entering passengers then divide into two streams, part coming in one door and part in another. The front exit door is supposed to be used by all of the passengers in the front half of the car, although it has been found in practice that only about two-thirds of them do so.

Some remarkable results have been obtained through having two streams of passengers board simultaneously and pass on opposite sides of the fare box. The loading time per passenger at certain corners is less than one second, the average at the heavy loading points (including the time of the fellow "who never has change")

LOW-FLOOR CAR—VIEW SHOWING CENTER ENTRANCE AND FRONT EXIT

being only slightly more than one second. In general, the separate control of the center doors has been found to be an excellent feature since it permits the conductor, without saying anything to any of the passengers, to guide their movements. Also it is possible in cold weather, when only one or two people want to board the car at a certain point, to open only a small part of the car to the outside atmosphere.

The exact weight of the new cars, fully equipped for double-end operation, with two fenders, two couplers, two controllers, etc., is 35,600 lb. If the car should be arranged for single-end operation, with only one set of doors, one controller, etc., the weight would be 33,000 lb. Car-body and equipment weights are as follows:

Weight of car body, conduit, wiring and air-brake piping.....	18,000 lb.
Weight of air brakes	950 lb.
Weight of motors	7,000 lb.
Weight of other electrical equipment.....	1,250 lb.
Weight of trucks	8,400 lb.

Total weight 35,600 lb.

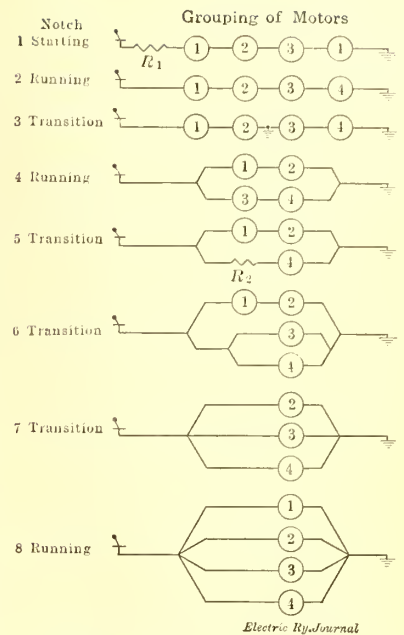

The car-body weight includes all accessories as well as the air-brake piping and the wire and conduit for the motors and control. The weight of steel in the car framing is 6800 lb. The over-all length of the body is 45 ft. and the width is approximately 8 ft.

From the above table it is manifest that the low total weight of the car is brought about in great measure by the reduction in weight of the apparatus under the car rather than in the car body itself. The small wheel, in itself, reduces the weight by approximately 1200 lb. per car, and to its use can be traced almost all the other weight reductions. The axles of the trucks are lighter because of reduced strains, and the truck itself, in all its members, is lighter than with the larger wheel. In practice the lighter weights of the members are found to have ample strength. Theoretically the closer the center of gravity is to the track, the harder the impact from side motion, but in practice, in slow-speed city service, the distance that the car body travels in a side "slap" seems to be the controlling factor, since the low-floor car rides much better over rough track than the high-wheeled car. The details of the truck were worked out under the supervision of F. R. Phillips, superintendent of equipment.

The prominent feature of the truck is the elimination of end frames, the truck being held square by gussets that connect the transoms and the arch-bar-type side

frames. The weight of 4200 lb. for the truck indirectly enables a total saving of 3400 lb. to be made over the standard type with large wheels, 740 lb. of this saving being in the smaller axles and 1200 lb. being due to the smaller wheels. Elliptic springs are used, these resting on a spring plank supported by 15-deg. swing links from the transoms, and it is reported that the arrangement makes the low-floor car actually ride more easily than the standard types, even in high-speed suburban service, where several of the cars of low-floor design are used.

The electrical equipment consists of four GE-247-A, 35-hp motors with Jones control built by the General Electric Company under the Jones-Welsh patents. The control differs from that used on the earlier low-floor cars in having a new type of unit switch, this being of the armature type instead of the plunger type. The contactors are arranged in two switch-group cases, the reduced size making it easy to find a place for the groups beneath the low floor of the car. The combinations and connections provide for the use of interlocks on the contactors to establish holding circuits whereby the motors are maintained in parallel groups while the control handle is being thrown off, thus affording a closed path of low resistance for the discharge of magnetic energy. In this way burning of the contactor tips is greatly reduced since the contactors act as commutating switches, and with the exception of one or two units have very little actual rupturing of the current to do.

○ Running Points

LOW-FLOOR CAR—SCHEMATIC DIAGRAM FOR CONTROL AND SEQUENCE OF SWITCHES

There is also provided a method of cutting out damaged motors by use of the control circuits which simplifies the car wiring.

In this control system resistance is used only on two transition points or when all four motors are in series and when the first motor is thrown in parallel across the line. In the original control system only two motors worked on the transition points, whereas the above plan shows never less than three from the series-parallel position to the final position. By the use of an additional contactor, three or more motors can be used throughout the entire range, but in practice this has been found unnecessary for the first part of the accelerating period. It should be said that a few of the controllers with the original connections are still in service and work very well except that the acceleration is not as rapid as with the new scheme.

Since there are three running notches, the transition points are used only for very short intervals. It is found that the motormen make frequent use of the first running notch with all the motors in series, when behind slow-moving wagons, and the power, therefore, is not continually thrown on and off. This saves controller fingers, brakeshoes, wheels, current, and last but not least, nerve force of the passengers.

Three extremely hilly routes in Pittsburgh have been equipped with the low-floor cars, and it is found that the current consumption is approximately the same as when the same number of small-capacity single-truck cars were in operation on these lines. Tests lasting for about two and one-half months show that this control

LOW-FLOOR CAR—VIEW OF MOTOR FOR 24-IN. WHEELS

LOW-FLOOR CAR—RELATIVE SIZE OF LOW-FLOOR AND STANDARD TRUCKS

takes from 8 per cent to 15 per cent less power than with the standard, resistance-type, series-parallel control when used on cars of the same weight. The amount of saving, of course, depends largely upon the number of stops per mile. The design of the resistance and the smaller capacity of the motors, it may be said, help to reduce the car weight.

One other feature of the car is a new type of compressor which was specially designed by the Westinghouse Air Brake Company to fit the available space and to reduce the vertical height occupied to the absolute minimum.

DESIGN OF LOW-FLOOR MOTOR

Naturally, the development of motors small enough for use with 24-in. wheels has raised some question as to the methods by which this most important step toward efficient operation has been made. As a matter of fact, in the design of the low-floor motors nothing has been skimped to save weight, and the construction has been worked out along normal lines, the designers utilizing all of the latest available knowledge about railway equipment to produce the best results consistent with generally accepted practice.

This is indicated in the following table, which shows that there is nothing in the new design that is greatly

LOW-FLOOR CAR—CHARACTERISTIC CURVES OF MOTOR FOR 24-IN. WHEELS

different from the electrical and mechanical features of the older types of motors. The new type, which is known as the GE-247 motor, is of the same rating as the old standard GE-81, and on this basis may be compared with it. The field windings of the two motors cannot, of course, be compared because the GE-81 motor is a non-commutating-pole machine while the GE-247 motor has commutating poles. The armatures, however, are wound with exactly the same number of turns per coil. In both cases the air gaps are normal, being eccentric, and they should not vary from each other more than 1/64 in. The new motor, also, is ventilated, whereas the older one is not. This feature has naturally increased its relative hourly rating and has given it as well a high continuous ampere capacity.

COMPARISON BETWEEN LOW-FLOOR MOTOR AND STANDARD MOTOR

	GE-247	GE-81
Rating 600 volts	35 hp	35 hp
Rating 500 volts	30 hp	30 hp
Clearance under frame:		
30-in. wheels		4 3/4 in.
24-in. wheels	3 5/16 in.
Speed (500 volts, 55 amp).....	605 r.p.m.	610 r.p.m.
Diameter of armature.....	10 1/2 in.	11 1/2 in.
Number of slots.....	27	29
Turns per coil.....	3	3
Length of commutator.....	2 3/4 in.	3 in.
Thickness of shell.....	7/16 in.-1 1/4 in.	1/2 in.-1 1/4 in.
Diameter of armature shaft.....	2 3/4 in.	2 3/4 in.
Weight with gears and case.....	1750 lb.	2020 lb.

Summed up it may be said that the 24-in. wheel, with all of its inherent advantages in reduced weight, has been made possible mainly by the adaptation of commutating poles and ventilation to a small-size motor, together with a reduction of 1 in. in clearance

LOW-FLOOR CAR—PLAN SHOWING NEW SEATING ARRANGEMENT

under the motor frame. Aside from these features the considerable saving in weight and size has been effected without departing in the least from the substantial mechanical design of standard motors. The efficiency tractive effort and speed curves are shown in an accompanying diagram.

DETAILS OF CONSTRUCTION

It should be said also that part of the saving in weight has been obtained by the use of the box type of frame. This has for long been considered necessary for large motors, and its adoption for a motor of this size is a perfectly logical step. The box frame of the new motor is approximately octagon in transverse section, and has the four main exciting poles located at angles of 45 deg. to the vertical. Bails are cast on the frame for handling the motor, and brackets are provided for bar suspension. A large opening is provided over the commutator, this being closed by a pressed-steel cover held in place by a cam locking device. The frame heads have auxiliary oil wells, and drain pockets for oil thrown off by the oil deflectors on the armature shaft. All covers on the axle and armature-bearing oil boxes have deep lips and are lined with thick felt held in place by rivets and washers, a sheet steel dustguard inclosing the axle between the axle caps. Provision is made for a 4-in. diameter of axle in the axle linings and for linings 7 in. in length. The gear case is made of sheet steel, each half being pressed from a single sheet, and it is supported by a horn cast on the axle cap at the pinion end.

The exciting pole pieces are built up of laminations

assembled on keys which are bolted to the frame by tapped bolts inserted from the outside. The commutating pole pieces are drop forgings. The mummified type of coil is used for both main and commutating field coils, the insulation following standard General Electric practice in all respects. The exciting coils are held against steel pads by spring angle flanges, and the commutating coils against finished seats in the frame in a similar manner.

The armature, of course, is built up of laminations assembled on and keyed to the armature shaft, longitudinal ventilating ducts extending through it and through the commutator shell and armature heads. The commutator is 9 1/8 in. in diameter and is built up of hard-drawn copper, insulated with mica grooved out to a depth of 3/64 in. below the surface of the commutator. The bars are insulated from the shell by cones of mica pressed to shape, the whole being pressed together hydraulically before the locking nut is tightened up. The insulation of the armature coils, hot banding, etc., and the brush-holder design also follows standard General Electric practice.

Ventilation is effected by a double or multiple fan which is made integral with the pinion-end armature head and which draws air into the motor through hooded openings provided in the commutator-end frame head. The air divides into two streams, one passing over and around the armature and field coils, the other taking a parallel path through the ventilating ducts in the commutator shell and armature core. After passing through the double fan the streams unite and are exhausted to the atmosphere through screened openings in the frame. By this means a positive circulation of air is maintained through the motor, cool air coming in contact with all parts of the motor.

In designing this motor no effort has been made to reduce the weight below limits that are consistent with sufficient strength and rigidity; therefore, it is well suited to handle loads within its range of capacity. This has been demonstrated by the fact that the original motors of this general type have been in hard service for nearly two years with a low maintenance cost. In fact, approximately 500 of the GE-247 motors have already been supplied for cars with 24-in. wheels, and all of them at the present time are giving very satisfactory results in operation.

Congresses at San Francisco

Eight hundred and twenty-two conventions and congresses, whose subjects cover the activities of the world along industrial, commercial, professional and scientific lines, will meet in San Francisco and the bay cities in connection with the Panama-Pacific International Exposition during the 288 days of its existence. This is more than double the number at any previous world exposition, and to secure them practically all organizations of importance in the civilized nations of the world were thoroughly canvassed by the exposition authorities.

The attendance at each of the conventions and congresses will range from 100 to possibly 30,000 delegates and visitors. There will be an average of nine exposition conventions per day throughout the entire period. But few days are blank, and on certain days during the summer months as many as thirty or forty meetings of various kinds will be held.

Following are the classifications geographically and the popular months: national conventions, 525; international congresses, 57; Pacific Coast conventions, 68; California conventions, 172. August is the month during which the largest number will be held, namely 249. July follows with 133, and September with eighty-six.

Pacific Claim Agents' Convention

Abstracts Are Given of Six of the Papers Presented at the Annual Meeting of the Pacific Coast Claim Agents' Association—Result of the Election of Officers

The seventh annual meeting of the Pacific Coast Claim Agents' Association was held in San Francisco on June 24-26. There was a full representation from member companies. The sessions were notable for the number of very able addresses and papers presented. One of these was published in abstract in the issue of this paper for last week, and abstracts of others appear this week.

At the meeting on June 26 officers were elected as follows:

President, Thomas G. Aston, claim agent Washington Water Power Company, Spokane, Wash.

First vice-president, Thomas A. Cole, claim agent Los Angeles Railway Corporation, Los Angeles, Cal.

Second vice-president, W. H. Moore, San Diego Electric Railway Company.

Third vice-president, J. S. Mills, assistant superintendent Key Route, Oakland, Cal.

Secretary and treasurer, H. G. Winsor, claim agent Tacoma Railway & Power Company, Tacoma, Wash.

Executive committee: J. H. Handlon, claim agent United Railroads, San Francisco, Cal.; A. M. Lee, assistant general claim agent Northern Pacific Railway, Seattle, Wash.; B. F. Boynton, claim agent Portland Railway, Light & Power Company, Portland, Ore.; George Carson, claim agent Puget Sound Traction, Light & Power Company; H. K. Relf, general claim agent Spokane, Portland & Seattle Railway, and S. A. Bishop, general claim agent Pacific Electric Railway, Los Angeles, Cal.

Tacoma was chosen as the place for next year's convention.

THE INVESTIGATOR AND HIS WORK

BY C. F. YOUNG, ADJUSTER PUGET SOUND TRACTION, LIGHT & POWER COMPANY

The investigator, to my mind, is next in importance to the claim agent or adjuster. Loyalty, of course, is one of his first requirements. He should be above the average degree of intelligence and come within the most critical definition of the term gentleman. Then his personality should be pleasing, and he should approach people in a manner to inspire confidence. He should also be a good listener, be able at once to impress upon the witness his fairness in the case in question, and fairly to influence an obstinate or prejudiced person. He should be honest in all things, clean morally, dress neatly but not overdress, as his work requires him to meet all classes. He should be particular when calling upon people below him in rank not to talk over their heads. He should hold his temper always, but by so doing not let the other fellow imagine he is afraid.

He will find cranks and critics in many places, as well as scores of people with complaints, real or fancied, and to these he must be able to make answer without provoking an argument. Many times, the fact of calling attention to the difficulties of operation or the tribulations of the trainmen in dealing with the public and endeavoring to please all, will be of material help in effacing prejudice and creating a friendly attitude. A good way out of many such incidents is for the investigator to explain that the claim department has nothing whatever to do with the operating end but that he will be pleased to call attention to the complaint or sugges-

tion, and in this way many timely suggestions have been so made and reported to the proper department.

The investigator should be sufficiently acquainted with the subject under investigation to know what he is seeking and recognize it when he sees it, thus cutting out all suppositions and embodying in his statement positive facts to which the witness could testify if called upon the stand later. A reasonably short, clear statement covering the facts will help to save much of the time of the witnesses, most of whom are disinterested and conferring a favor upon him.

The investigator should be on the best of terms with all other employees, so far as is possible, and especially with heads of departments. His treatment of trainmen should be such that they may look upon him as a friend trying to build up a defense not only for the company but for the man or men who have had the accidents. If he has established this feeling he will secure many good tips from them.

He should be able to use a camera to secure pictures of conditions at crossings, landings, steps and platforms as well as street intersections, thus having evidence which is hard to refute months or years later in a suit, when conditions may have changed.

THE ORGANIZATION OF PUBLIC SAFETY COMMITTEES

BY B. F. BOYNTON, CLAIM AGENT PORTLAND RAILWAY, LIGHT & POWER COMPANY, PORTLAND, ORE.

After years of work along safety educational lines with our trainmen in Portland in the public schools, and in various other ways, we began to receive letters from all over this country and foreign countries inquiring about the methods and results of our work. We began to feel we had really accomplished some good in eliminating accidents, as we had reduced the number of accidents on our own property about thirty a day. One day I called on the Mayor and showing him the documents we had received from the various cities and countries, I told him I thought that a public safety committee, backed up by prominent men in our city, could accomplish a great deal toward making Portland the safest city in the world. The Mayor thought the suggestion a good one and appointed a committee consisting of nine bureaus, as follows:

Bureau of public safety—John T. Moore, captain of police.

Bureau of fire prevention—A. M. Churchill, lawyer and chairman of fire prevention bureau of Civic League; E. F. Dowell, chief of fire department, and Jay Stevens, fire marshal.

Bureau of traffic—H. P. Coffin, chairman public safety committee of Portland Automobile Club, and A. S. Kirkpatrick, city traffic engineer.

Bureau of schools—L. R. Alderman, superintendent of schools.

Bureau of transportation—F. L. Burckhalter, general superintendent Southern Pacific Railway.

Bureau of electric transportation—B. F. Boynton, general claim agent Portland Railway, Light & Power Company.

Bureau of industrials—M. N. Dana, *Evening Journal*.

Bureau of buildings—R. L. Withrow, *Evening Telegram*.

Bureau of publicity—H. E. Thomas, city editor *The Oregonian*.

Advisory board—G. W. Talbot, president Pacific Power & Light Company; F. C. Knapp, Peninsula Lumber Company, and A. H. Averill, Averill Machinery Company.

These men, you will see by the positions they hold, are representative men in representative positions. Each man has his branch of work to cover.

The first public step, after our organization, was to get our fire marshal, Jay Stevens, to go in full firemen's uniform, with H. P. Coffin, chairman of our public safety committee at the present time, and myself, to our various public schools throughout the city and talk to the children on fire prevention. Mr. Stevens, being a very interesting and entertaining talker, was received at all the schools with great enthusiasm, and we have a record at the present time of having saved two schools and a great many lives as the result of Mr. Stevens' talks. At the time he started his school lectures many false fire alarms were being rung in every day, which not only cost about \$25 each to answer, but introduced an element of danger from the heavy fire apparatus plunging through the streets at breakneck speed. He showed in his talk to the school boys that the fire engines, in answering one of these false alarms might collide with a street car, injuring the firemen and possibly the boy's own mother in the street car. This caused all the boys to think. They stopped turning in false alarms, and to-day a false alarm is a rarity in the city of Portland.

For a number of years I have been gathering different safety data and safety propaganda of every description from all over the world; in fact, I have quite a large room in our building given over entirely to a safety-first exhibit. To impress the members of the Commercial Club and Portland's citizens with what was being done along safety lines, I had this entire exhibit moved to the dining room of the club, and on the occasion of our first general meeting there we invited a number of representative employers to attend. The enthusiasm and interest displayed at that meeting has ever since been growing. We held other meetings at the Commercial Club, which was then Portland's representative business organization. Every meeting has been largely attended.

Within the past few months our Commercial Club and Chamber of Commerce and other large clubs have combined into one organization, namely, the Chamber of Commerce, thus making an organization of approximately 5000 members. The new Portland Chamber of Commerce in its budget just prepared, has made a very liberal allowance for carrying on the safety work.

Since the establishment of the public safety committee, our city has appointed a public-safety man. This gentleman, A. S. Kirkpatrick, has installed between 300 and 400 caution signs at dangerous points all over the city. They are steel disks 18 in. in diameter, mounted on steel tubing 6 ft. high, painted red with a green center, and are set in concrete just inside the curbing on the right-hand side of the street at various distances from danger zones, warning the drivers of teams and machines of the condition ahead. "Sharp Turn," "Steep Grade," "Railroad Crossing," "School, Drive Slow," "Fire Station," "Reverse Curve," "Hospital," and other warnings are painted on these little disks.

Up to May 1 our public safety committee had 153 automobile drivers arrested (and most of them were fined) for disobeying the traffic ordinance in passing street cars while the latter were discharging passengers. Before the organization of the public safety committee many passengers were knocked down and injured in this manner, but now, when a street car stops, no matter

how many machines there are behind it, they all throw in the reverse and come to an immediate stop.

Our fire marshal has appointed a number of deputies, who all wear regulation fire inspector's uniforms. Every building in the city of Portland is being examined by him or his deputies for fire hazards, and we expect to carry out just as thorough work through every branch of industry, and in so doing solve through education the greater portion of the accident problem. I find that by being liberal enough to take an interest in the other phases of safety work than that which directly affects the company I represent, a feeling of desire to reciprocate and help us is created among all classes of people in a way that could not possibly have been done in any other manner.

THE EMPLOYMENT BUREAU

BY H. G. WINSOR, GENERAL CLAIM AGENT PUGET SOUND
ELECTRIC RAILWAY AND TACOMA RAILWAY &
POWER COMPANY

There are many types of applicants for employment but comparatively few can be classed as eligible. The process of elimination quickly disposes of such as the man who cannot afford time for proper instruction; or the one who is always financially embarrassed; or the man who is a "globe trotter" and has a pocket full of service letters; or the man who can tell his instructors just how the work should be done. We have no use for the man who is dissipated or naturally uncouth in appearance, and above all, we should shun the man who expects to secure a position through political influence.

On the other hand, the employment official of experience and mature judgment will quickly recognize probable merit in the following types:

1. The man who presents a desire to undertake the work without condition, depending entirely on his personality for favorable consideration.

2. The man who presents himself at an hour which he selects as being most convenient for the employment official and enters the office in a respectful manner.

3. Those having seen honorable service in the army and navy. Such men usually make satisfactory trainmen as their experience teaches discipline and loyalty.

The employment of men should be undertaken by one who is a good judge of human nature. If so, he can find out many of the defects of an applicant at a single interview. "Make haste slowly" is a splendid maxim for adoption by employment officials. Many an applicant who has the ability and personality to "make good" and a spirit of loyalty which would recommend him after deliberation has been disheartened and lost to the service through an abrupt, indifferent or discourteous reception of his application for employment.

Two important essentials for employment are character and physical fitness for the duties required. The investigation of an applicant's history is usually obtained through references and is often incomplete so that the employer's ability to judge finds its value in this regard. Physical fitness is determined by a medical examination, and such examinations should be thorough and complete.

A man who has had experience in public service work requires fully as close scrutiny as others, and it is a mistake to assume that his record is a passport to employment. Courtesy should be an absolute requirement. If a man applying for employment walks into your office unannounced, if he fails to remove his hat, places his feet on the table or other furniture, he should be courteously told why he cannot have a trial. When you are engaged in a personal interview with an applicant, and he volunteers the information that at the last place he worked he could have remained had he ap-

proved of the methods or systems used by his former employer, you may reasonably question his loyalty. Men under twenty-five and over forty-five years should not, as a rule, be considered, although there are exceptions. Trainmen under twenty-five lack experience and are likely to assume too great risk, while the man over forty-five, unless he has had previous experience, is hardly likely to make a satisfactory record.

Nearly all electric railways employ one or more experienced officials whose special duty it is to prepare the motorman student by instruction and demonstration for his work at the controller. To facilitate this work a dummy car fitted with the necessary appliances is often provided. When the instructor is satisfied that the student is competent he is sent out on the different lines for instruction by experienced trainmen in the actual operation of cars. From ten to fifteen days is usually consumed in this preparatory work. When the student is employed as a conductor he is instructed in practically the same manner, although along somewhat different lines. Oral examinations are always necessary to determine the advancement made by students and to satisfy the operating department of their growing efficiency.

From the information at hand it has been rather surprising that very few companies require a written examination. In our organization the conductor's examination blank contains eight-four questions pertaining to operation and thirty-two pertaining to accidents

much good results to both employee and employer if such an association is properly organized and managed. We believe that through welfare work many valuable men have been retained in our services. To support that contention, a record of trainmen entering and leaving the services of the Tacoma Railway & Power Company for the years 1912-1913-1914 is presented in the accompanying table.

The profit and loss account of a company is affected materially by necessary settlement of claims brought by reason of the acts of its employees. In the organizations which I represent the claim department is not only consulted and its approval required before a student is assigned to regular duty, but no trainmen is discharged without a conference of the superintendent of transportation and the claim agent. All examination papers and other records are submitted for the guidance and the assistance of the claim department, and all students are sent by the superintendent to receive advice and instructions in safety and accident work from the claim agent.

INVESTIGATION AND HANDLING OF COLLISIONS WITH PEDESTRIANS AND VEHICLES OTHER THAN AUTOMOBILES

BY THOMAS G. ASTON, CLAIM AGENT WASHINGTON WATER POWER COMPANY, SPOKANE, WASH.

All accidents should be investigated carefully. For example, in a recent damage case on our road two persons were sitting in cars going in opposite directions. Each had a left arm projecting from a window, and as the cars passed the arms were interlocked, causing both to be broken. The contention was that the cars scraped together while passing in a curve. One of the witnesses asked at the time of the accident to have the cars backed up together and made a measurement which proved that there was plenty of space between, and the investigation at the time showed that there were no marks on either car.

The car men should be instructed to make note of the exact place on the street where an accident occurs and should call it to the attention of witnesses, who should be placed on record as to the exact point. Witnesses should be asked to mark the point at which an accident occurs by some immovable object. This may assist in proving that the driver was on the wrong side of the street, or in the act of turning the corner in violation of the traffic ordinance, or that the accident occurred between blocks instead of on a crosswalk or at an intersection.

Measurements should always be made and photographs should be taken of the scene of the accident as soon as possible. The car and vehicle involved should also be photographed, bringing out all marks. This will establish the amount of damage and show the parts which came in contact, thus helping to prove whether the vehicle had just pulled onto the track or had partly crossed. I recall several cases where photographs were of considerable value to us.

If an accident is serious it is our policy forthwith to have an engineer's map made of the location and vicinity, showing all houses from which any person could have viewed the accident. The grade and height of rail should also be shown. After the map is made an investigator should canvass every house shown thereon and take statements from at least one person in each house to ascertain whether or not anyone in the house claims to have seen the accident. That this is a good practice was taught to us in a very serious case involving the death of a driver of a vehicle. Two persons living about half a block from the scene of the accident testified to having seen the accident, and that no

SERVICE RECORD OF TACOMA RAILWAY & POWER COMPANY

and accident prevention; the motorman's blank has 123 questions on operation and thirty-seven on accidents. So far as the effect of this system concerns our claim department it has been of material assistance in reducing the number of accidents as well as assuring complete and satisfactory reports.

Final instructions should be given by the employment official who selects and employs the applicant, and when this important duty is performed he should have before him a complete history of the man, gathered from the various sources at his command. Any criticism of his work or examination should be pointed out in a kindly but impressive manner.

Employees who remain in the service for a number of years are usually those who are interested in and have a liking for the work. These are the most desirable men, and every effort consistent with good policy should be made to encourage them. Employees should have as much recreation as possible consistent with their duties and the condition under which they are employed. Comfortable quarters with good light, good ventilation and toilet facilities should be provided, as should also reading matter of the right character. Good reading matter is always appreciated and easily furnished. Frequent visits by the company officials to the quarters of the men will likely result beneficially. An employee desiring to make complaint should be courteously received and his request promptly considered. The report of an employee's sickness or death should mean prompt action on the part of his immediate superior. Occasional entertainments for the benefit of the employees and brief discussions are sometimes used as a means of keeping up an interest in certain parts of the work. The organization of benefit associations has worked satisfactorily in some cities and

warning was given. To my mind they did not see the accident or car until after everything was over, and I believe that they would have made a statement to that effect had they been interviewed at the time of the accident or shortly afterwards.

THE MEDICAL DEPARTMENT

BY GEORGE CARSON, GENERAL CLAIM AGENT PUGET SOUND TRACTION, LIGHT & POWER COMPANY

The value of the medical department to the claim department is derived from the aid rendered, in handling the situation properly, after the accident has occurred, although the medical department sometimes may be able to offer suggestions of a kind that might tend to prevent accidents. The physician of a railroad should regard himself and his department as an exceedingly large and important factor in the work of the claim department, and should aid whenever possible in the saving of expense of that department in a proper way.

In so far as the handling of accidents is concerned, prior to the time the claim is adjusted or rejected, the medical department should act under the general direction of the claim department in regard to calls on the injured person, examinations, reports, etc. This, of course, in no way refers to matters of a strictly medical nature, as, for example, medical treatment of injured persons, such not being within the province of the claim department. Neither should the medical department interfere in any way in that which is strictly claim department work, such as legal investigations, adjustments, etc.

The physician representing a railroad as the head of the medical department and his assistants should be gentlemen of the highest standing and ability in their profession. Their ability should be such as to enable them to detect the accident faker and malingerer, making it impossible for them or unfair physicians to "pull the wool over their eyes." The company physician and his assistants should be of pleasing personality and should be capable of inspiring confidence in injured parties when first visiting. They should be within call at all hours of the day and night, to respond promptly to emergency calls and render first aid when necessary.

As thorough an examination of the injured party as may be consistent with the conditions should be made at the first visit, and under no circumstances should the injury be minimized. If there is any element of doubt as to the extent of the injury, it would be better to resolve such doubt in favor of the injured party. Any departure from this policy might result most disastrously to the company. Since medical reports are the basis upon which settlement is made, particularly in cases of liability, failure to discover a bad condition of the claimant, if such existed, would easily bring about failure to reach a settlement and result in a costly lawsuit. In making an examination of an injured person it is exceedingly important that the examination be thorough, if only for the purpose of satisfying the party of its thoroughness, otherwise the claimant will say to me that our physician had not made a thorough examination and therefore could not tell how he was suffering.

At the time of making the examination, if the condition of the patient will permit, the company physician should get, so far as is possible without offending or antagonizing the injured party, his complete history, including details relating to any accidents he might have previously incurred. Promptly after the examination has been made, a full and complete report should be sent to the claim department. Better reports, I think, can be made on blank sheets than on printed forms.

If at the time of the call of the company's physician on the injured party the family physician has not been called, the company's physician should ask the party whether treatment is desired by him or if the family physician would be preferred. If the injured party desires continued treatment by the company physician, such treatment should be rendered, but no effort whatever should be made to induce the injured party to continue treatment with the company physician, and such treatment should be rendered only when entirely agreeable to the injured party. If the family physician or an outside physician should be called in a case, pending its disposition, the company physician should keep in close touch with the injured party, either by consulting with the attending physician, or by examinations, keeping the claim department continually advised of the situation from every possible angle within his observation, including information as to whether or not the attending physician of the injured party is disposed to be fair, etc.

When visiting the injured party, the company physician, if tactful and diplomatic, can do a great deal toward paving the way later for the claim agent or adjuster to make a reasonable settlement. This many times is of great benefit both to the injured party and to the company.

When persons are injured in connection with our cars to an extent making it necessary for them to have hospital treatment, no particular hospital should be selected. The injured person should be taken to the nearest hospital where proper attention may be secured, or to any hospital that he might prefer. In a case of no liability and the injured person has no preference, then he should be sent to the city hospital for the purpose of saving expense to the company. The latter, however, would be a matter to be passed upon by the claim or operating departments, as the company physician is not supposed to know anything about liability.

When it becomes necessary from the viewpoint of the company physician to employ a specialist, who as a rule is not on a regular salary, the company physician should first ascertain whether the claim department is desirous of incurring the expense, as many cases might arise in which the company would not derive any benefit from a specialist's examination.

THE INVESTIGATING AND HANDLING OF AUTOMOBILE ACCIDENTS

BY H. H. BENTON, DISTRICT CLAIM AGENT NORTHERN PACIFIC RAILWAY, SEATTLE, WASH.

The phrase "Stop, look and listen," when applied to vehicles at grade crossings, can hardly be considered a safe rule of law for the claim agent. The true rule is this: the driver of the vehicle "must act with such care and caution for his own safety as a reasonably prudent man would be likely to do under like conditions."

For example, if a driver's machine is comparatively noiseless and does not materially interfere with his power to hear an oncoming train he may fail to stop and yet not necessarily be negligent. He should look and listen, but if looking and listening could avail nothing, his failure to do the useless thing would not necessarily bar his right of recovery if a negligently operated train collided with his automobile.

With these rules of law affecting the possible liability of the railway company firmly fixed in his mind the claim agent, in the investigation of such a collision, should obtain all available evidence as to the negligence or carelessness on the part of the railway company, either as to the safe or dangerous character of the location and construction of its road, and the crossing itself.

The speed of the automobile and of the train should be investigated in order clearly to demonstrate where each one was at successive intervals preceding the moment of the collision. This opens the way for the application of the rule of law closely held by the courts that if the driver could plainly see he will be held negligent if he did not see. Again, it is important to note the location of the railway line near the crossing, to determine whether the roar of an approaching train would be likely to be muffled or lessened. The condition of the weather at the time of the accident is always important. Storms may impede sight, wind may smother sound; either may tend to make some acts negligent, or tend to excuse other acts which would under other conditions be negligent.

The average chauffeur boldly claims that he can stop his machine, when running at 12 m.p.h., within a distance of 4 ft. This is absolutely untrue when applied to conditions under which collisions occur. At a speed of 12 m.p.h. his machine travels $17\frac{1}{2}$ ft. in one second, so that while descending into a cut at a grade crossing where the view of an approaching train might be obstructed, the chauffeur, when 25 ft. from the track, suddenly beholds the rushing train, he only has one and a half seconds to come to a stop. He imagines that 25 ft. is all that he needs, but he is mistaken.

Following Up Watt-Hour Meter Records at El Paso

Both Meters and Methods Have Stood Up Well After Nearly Four Years of Service

The El Paso (Tex.) Electric Railway began the use of Sangamo watt-hour meters in December, 1911, equipping at that time every one of its fifty motor cars. Since then fifteen meters have been added to new equipment, making a total of sixty-five motor cars.

The energy consumption savings were first presented by George G. Morse, superintendent railway department, before the Southwestern Electrical & Gas Association at its 1914 meeting (see the ELECTRIC RAILWAY JOURNAL for May 30, 1914, page 1,206). Mr. Morse showed that an average energy consumption of 2.61 kw-hr. per car-mile in 1911, without meters, had been reduced to 2.39 kw-hr. shortly after the installation of the meters. These averages, it should be stated, were readings taken at the d.c. busbars, therefore including all low-tension distribution losses. As the result of continued competition and the follow-up system, the energy consumption for the entire system is still (April, 1915) at 2.39 kw-hr. per car-mile, despite the addition of fifteen double-truck cars, which, of course, are heavier than the single-truck cars which formerly carried most

EL PASO CAR METERS—INSTALLATION OF WATT-HOUR METERS ON INSIDE ARCHWAY

of the business. In fact since the meters were first installed, the proportion of double-truck mileage has risen from 43.2 per cent in 1911 to about 54 per cent in 1915.

As stated in Mr. Morse's original paper, a bogey or standard was set up, after test, for each of the four classes of cars. This bogey plan still forms the basis of the follow-up system. In Mr. Morse's opinion, faithful adherence to the follow-up system is much more important than the type of checking device used on the car.

FOLLOW-UP RECORDS

The records begin with the meter slip made out by the motorman. On taking a car out, he takes and records his first meter reading. At the end of his work on that particular line he gets from his conductor the number of passengers handled. This record also shows the line on which he ran, the number of trips made (the mileage being figured later by the mileage clerk) and the car number. These motorman's slips are padded in a

EL PASO CAR METERS—MONTHLY COMPARATIVE RECORD OF METER PERFORMANCE ON A SPECIFIC TYPE CAR AND ROUTE

EL PASO ELECTRIC RAILWAY COMPANY

INSPECTOR'S METER DATA

Your attention is called to the performance of the following men, made on April 29, 1915.

Line	Name	No.	Car	PERFORMANCE		Notes
				Actual	Bogey	
Mexico	Broderson	66	80	12.20	7.25	
	Reynolds	78	79	8.05	7.25	
	Serivenor	184	71	8.05	7.25	
	Dieterich	80	81	9.00	7.25	
	Weaver	114	79	8.20	7.25

	Wilcox	84	92	11.70	10.50	
	Glaves	126	88	12.00	11.50	

Remarks:

EL PASO CAR METERS—RECORD OF DELINQUENTS SENT TO INSPECTORS ON THE DAY FOLLOWING THE PERFORMANCES NOTED

book in duplicate, so that the user can keep the stub for his own information and check.

The meter slips are first examined by the meter clerk for those men who have fallen below the bogey for their class of car. These delinquents are listed as shown on a sheet called "Inspector's Meter Data." Copies of this report are in the hands of all road inspectors by 11 a.m. the next day. Therefore, the inspectors are prepared to ride and correct the operating faults of the delinquents while all concerned still have in mind all the conditions of the preceding day. For example, a heavy sand storm, as is common in the vicinity of El Paso, will clog the rails and so increase energy consumption. Another cause of increased energy is found in heavy rains which leave much sand on the track. The inspectors, naturally, exercise their judgment under conditions of this character.

Records from all slips, regardless of delinquents, are also posted on a monthly sheet which is divided horizontally by days and vertically by routes. Each route is also subdivided vertically for the car number, kilowatt-hours, trips and passengers. The total kilowatt-hours per car-mile and kilowatt-hours per 1000 passengers are written at the top. This monthly record is made out in four colors, one for each type of car.

In order to make comparisons as fair as possible, the number of passengers handled is noted, as above stated. To avoid too much clerical work, however, the comparisons are made on the basis of 1000 passengers carried with any given type of car. The factor of schedule speed does not enter, as this is the same on any given line for any given period of the day, no comparisons being made between different lines. The average schedule speed of the system is 8.1 m.p.h.

The recapitulation of the monthly record for each type of car is prepared in typewritten form, as shown, for posting at the carhouses. This report presents each motorman's name, number, kilowatt-hours per car-mile, kilowatt-hours per 1000 passengers and his relative rating. This rating is obtained by dividing each

man's average kilowatt-hours per car-mile by the grand average of all men on the same line and type of car. The reference to passengers carried is used only where two men have the same rating on a kilowatt-hours per car-mile basis.

The interest of the men has been maintained chiefly by publishing their records, but their run privileges are sometimes modified by the nature of their performance. Before the men began to use meters they had no conception of the value of electric energy. The use of the meter has given them an entirely new point of view. Although the kilowatt-hour was an unfamiliar unit to the men, they soon became accustomed to it among themselves. However, they refer to the readings as so many "points" rather than so many "kilowatt-hours."

MAINTENANCE

The fact that these meters have now been in service for nearly four years makes the question of their maintenance cost a matter of special interest. Until recently the meters were maintained by the general meter shop of the lighting department, but they are now cared for directly by the railway department. For the year 1914, the cost of maintaining sixty-five meters was only \$159.33, or \$2.44 per meter. This total includes the cost of repairing six meters burned out by lightning. Outside of these repairs, the chief expense was the removal and straining of oxidized mercury through cheesecloth, the replacement of the mercury and reassembling of the meters. This purification is carried out about once in five months. The total cost mentioned also covers the expense of testing. The special calibration meter used for such testing was purchased from W. T. Mobray, Providence, R. I., at \$150.

Illinois Association Trip to Milwaukee

Outing and entertainment features comprised the entire program of the Illinois Electric Railways' Association on June 25.

About eighty members and guests under the guidance of F. E. Fisher, president, and W. V. Griffin, secretary, left Chicago at 9.30 a. m. on the steamer Christopher Columbus and arrived in Milwaukee at 2.30 p. m. where they were entertained by the Milwaukee Railway & Light Company. They returned to Chicago over The Chicago & Milwaukee Electric Railway and the Northwestern Elevated Railway line.

En route to Milwaukee dinner was served in the main dining room of the steamer. After dinner, President Fisher called the members to order and impromptu remarks were made by several speakers. A vote of thanks was tendered Mr. Griffin in appreciation of his work in planning the trip.

On arrival at Milwaukee, R. B. Stearns, vice-president The Milwaukee Electric Railway & Light Company, conducted the party through the large Cold Springs shops and then through the Public Service terminal and office building of his company.

At 5 p. m. the party under the guidance of G. S. Henry, superintendent, and F. E. Low, traffic agent, left Milwaukee on a two-car train of the Chicago & Milwaukee Electric Railroad, arriving at Chicago via the Northwestern Elevated Railway at 7.45 p. m.

Ground was recently broken and the tunnel work begun on the projected electric mountain railway from the city of Bergen, Norway, to the summit of Mount Floien, the construction of which is estimated to cost \$160,000. Bids for its construction and equipment were issued in January, 1915.

EL PASO CAR METERS—MONTHLY RECAPITULATION OF DAILY METER PERFORMANCES

New York Electric Railway Association Meets

The Subjects Discussed Were Center-Entrance City and Suburban Cars, Financial Conditions, Jitneys and Interurban Highway Crossings, while Public Relations Were Considered at the Banquet

The thirty-third annual convention of the New York Electric Railway Association was held at the Oriental Hotel, Manhattan Beach, New York, on June 29 and 30. There was an attendance of between sixty and seventy at the technical sessions.

The convention was opened on Tuesday at 11.15 a. m. by President Hamilton, who delivered an annual address dealing with the present needs of the electric railways.

Mr. Hamilton referred to the extremely trying year through which the electric railway companies had passed during the past twelve months. He said that they had suffered financially along with industry generally as a result of the European war, and far more so than many industries on account of their inability to retrench to the same extent and counteract in various ways the effect of business depression. In addition, the companies had received another set-back in the form of jitney-bus competition, which has been and is still a serious menace to the industry. The electric railways are being compelled to sell transportation at a price based on service and under conditions of production of years ago. Although the traveling distance has increased vastly and the cost of production has advanced with leaps and bounds, the rate of fare has remained stationary. Jitney-bus competition and the business depression have reduced the earnings of the companies to an alarming extent, while expenses have increased to a degree which makes the 5-cent fare more and more inadequate for the actual needs of the companies. What the industry needs at this time is not "watchful waiting" but helpful action. It is all very well to theorize and discuss the many problems with which the industry is confronted and to sympathize with each other. But far more can be achieved if the companies assemble their best efforts and actively pursue fearlessly and honestly an organized campaign that will bring about the result and relief desired.

An example of effective and honorable activity is illustrated in the methods used by the association in advocating the enactment of the so-called jitney-bus bill. Thorough publicity was given to the railway side of the question, and a large number of representatives of various street railways appeared in a body at the public hearing on the bill and stated why the companies favored the legislation under consideration, in justice to all. It is gratifying to state that the bill is now a law of the State of New York. This fact indicates that the legislatures have been awakened to the fact that the interests of public service corporations must be protected to some extent, for the reason that these corporations do not exist by themselves alone but are necessary to the communities which they serve.

The report of the secretary and treasurer was then read. It stated that two companies had recently joined the association, namely, the New York & Stamford Railway Company of Portchester, N. Y., and the International Railway Company of Buffalo.

REPORT OF SAFETY RULES COMMITTEE

The president then called for the report of the committee on safety rules, of which John J. Dempsey is chairman. This report was presented verbally by Mr. Dempsey. He said that the committee of the association had met at Albany with the committee of the Empire

State Gas & Electric Association. Subsequently, the bureau of standards at Washington had announced that it was preparing a set of safety rules, and the committee had decided not to take any further action until a report had been rendered on the proposed rules by the committee that had been appointed by the American Electric Railway Association.

On motion of Mr. Peck the association decided to continue the committee on safety rules with instructions to review and criticize the proposed National Electric Safety Code promulgated by the bureau of standards and to act, subject to the approval of the executive committee, with the committee of the American Electric Railway Association on this subject.

CENTER-ENTRANCE CAR FOR CITY AND SUBURBAN SERVICE

The paper by W. G. Gove, superintendent of equipment Transit Development Company, Brooklyn, was then presented. An abstract of this paper appears elsewhere in this issue. After Mr. Gove had read this paper he showed on the screen a very interesting collection of views of different types of cars used in Brooklyn from early days.

In referring to his paper Mr. Gove explained that the car described was designed by the company's own force and also went through the hands of others interested. Mr. Menden, chief engineer of the company, was the first to think of it and was largely responsible for its design as well as that of the new subway cars of the company. Mr. Menden had had a long experience in the transportation side of the industry as well as in the engineering side, and this was of great help to him in the design of the car. A sample car was built before the final plans were finished.

At the close of Mr. Gove's paper various questions were asked him, and the following information, among other points, was brought out: The ball-bearing center plates are kept clean by blowing them out and by using a light lubricant. They have proved very successful. Although the cars were built largely in the shops of the company, Mr. Gove does not recommend this plan as a rule, believing that better satisfaction will be obtained when cars are purchased from regular manufacturers. The plan was adopted in this case owing to a combination of unusually favorable circumstances. The cost of the car complete was about \$6800 and the company is adding this year on capital account about \$100, making the total cost per car about \$6900. Mr. Gove estimated the life at thirty years. No trouble had been experienced with the concrete flooring breaking due to oscillation or weaving of the car. At the point where passengers enter there is a great deal of wear, and Mr. Gove thought that the entire floor of the pit of the car would have to be renewed probably each year.

INSUFFICIENCY OF 5-CENT FARE

On Tuesday afternoon President Hamilton first called upon Z. K. Graham, secretary of the Utilities Publication Committee, to explain the plan of issuing the public utilities reports, annotated, as arranged with a firm of law publishers. A paper by E. G. Connette, president International Railway, on "What Can We Give for a Nickel?" was then read by Secretary C. C. Dietz. Mr. Connette's paper is abstracted elsewhere in this issue.

In the discussion on this subject the following points were brought out:

W. H. Collins, general manager Fonda, Johnstown & Gloversville Railroad, said that as the 5-cent fare is prescribed within the confines of cities, legislation will be needed to increase the fare. The commission can be appealed to for relief, but the problem is how to find a remedy for the present difficulty.

C. G. Young, consulting engineer, New York, stated that the present conditions must be met somehow. The passenger wants more for the "jitney," and the company has to pay out more. One solution is to let the cities participate in the net earnings. The cities, being partners, would be interested in increasing these earnings. In the direction of economy rides could be shortened and transfers cut out in some cases. The large amounts spent for taxicab service show that the public is willing to pay for service.

R. L. Rand, vice-president Richmond Light & Railroad Company, described the experience of his company in drafting and pressing a bill exempting it from paving requirements for a period of ten years. There was no opposition, but the bill was side-tracked. Mr. Rand said that the paving requirement is antiquated and out-worn.

E. F. Peck of Allen & Peck, Inc., Syracuse, recommended the appointment of a committee to study the subjects discussed in Mr. Connette's paper.

H. W. Blake, *ELECTRIC RAILWAY JOURNAL*, said that while it will be difficult to increase fares there would probably be less public opposition to doing so because of the precedent of higher steam railroad passenger fares, and the principal thing now was to decide upon the best plan for each locality and work toward that end. There were three ways of raising fares and each had a precedent. They were: (1) Raise the unit fare to 6 cents as in Massachusetts. (2) Retain a 5-cent unit fare for a restricted district and charge additional 2-cent fares for exterior zones. While railway managers may consider this system complicated the experience in Milwaukee had shown that the problems of collection could be satisfactorily solved both as regards the company and the public. (3) Charge for transfers as in Cleveland. For this also there is an operating precedent. While these reforms seem revolutionary and may be difficult to secure, each is not seriously difficult from an operating standpoint.

James E. Hewes, general manager Albany Southern Railroad, described the tax-reducing campaign which his company had been conducting in the suburban territory served by it. Previous experience was with rising assessments, but after two years' effort the taxes have come down from 9 per cent of the income to 5 per cent, and the assessment 25 per cent each year. The company demanded meetings of the assessors one month before the preparation of tax budgets and presented evidence of assessment inequalities.

E. S. Fassett, New York Switch & Crossing Company, New York, thought that the publication of information in recent years should make tax reduction easier. If tax commissioners can be made aware of conditions, then reductions would be made by the franchise tax board.

C. Gordon Reel, consulting engineer, Kingston, N. Y., contended that the companies were often to blame for inequalities in assessments as their reports were not properly prepared.

After the close of the discussion a letter was read from the Brooklyn Rapid Transit Company inviting members to visit the new instruction school and to ride on the new subway cars.

A vote was also taken passing a resolution for the

appointment of a committee to report at a later meeting on Mr. Connette's suggestions. President Hamilton announced that he would appoint this committee later.

Messrs. E. S. Fassett, W. H. Collins and E. F. Peck were appointed as the nominating committee.

JITNEY-BUS COMPETITION

At the session on Wednesday morning James E. Hewes, general manager Albany Southern Railroad, presented a paper entitled "Jitney-Bus Competition" which is abstracted on another page. He emphasized the difference between the real jitney bus that consisted of an old automobile driven by its owner and the high-grade, large-capacity motor-bus, saying that the former was not a menace to the electric railway industry but that the latter could be used to good advantage, especially on new routes, to test and to build up the traffic with possible installation of an electric line later.

The discussion was opened by Joseph K. Choate of J. G. White & Company who had had a wholly contrary experience to that outlined by Mr. Hewes. If the motor-bus should become permanent it would eventually have to pay for its use of the highways which had been constructed at an even higher cost than railways. In New Jersey he had established a short bus line to form a physical connection between two separated sections of a trolley road. The traffic conditions were excellent but the line lost 100 per cent in six months and had to be abandoned. The repairs were excessive. Depreciation of all gasoline-driven vehicles also was impossibly high when compared to those on electric railways. As for the buses in London, these were put on years before the electric railways and had never competed with them, as implied by Mr. Hewes. He had investigated motor-bus operation for New York City and had found that any fare less than 10 cents was impossible.

Paul Smith, Westinghouse Electric & Manufacturing Company, then spoke in support of the makers of electric railway equipment, saying that the demand for low weights had arisen and endeavors had been made to meet it long before the advent of the jitney bus.

William H. Collins, Fonda, Johnstown & Gloversville Railroad, outlined his experiences with interurban bus competition, which in one instance consisted of a bus line operating 4 miles for a 5-cent fare in direct competition with the railway. A campaign of education including daily statements published in the local papers had been efficacious in producing refusals to grant franchises to motor-bus lines because there was no real necessity for the new service. Climatic conditions, he said, constituted the strongest argument against the motor-bus in central New York, as buses could not maintain service in heavy snow. However, there might be conditions where the bus could be used satisfactorily for supplementary service.

J. P. Barnes, Buffalo, Lockport & Rochester Railway, considered that publicity had been a major cause of the jitney's success, and that the railways should talk more about the railways in public and less about the jitneys. It was not necessary to have local holders of railway securities in order to hold the public's friendship.

H. W. Blake, *ELECTRIC RAILWAY JOURNAL*, disagreed with some of Mr. Hewes' figures. He believed that the figures quoted for gasoline consumption of motor-buses was low, but even on the basis mentioned in the paper the cost of power would be less for an electric car than for the motor-bus when figured on the seat-mile. The same basis should also be used in estimating the investment. He thought that the figure of 10 per cent for depreciation on the electric railway was much too high.

but a sixty-passenger car would have nearly three times the number of seats of a twenty-two passenger bus and more than three times the carrying capacity. Hence the annual depreciation, even on the basis given in the paper, would be one-third higher for the bus than for the car if the relative carrying capacities of the two vehicles were taken into consideration. The same ratio of comparison ought to be applied also to the figures on operating cost of 21.8 cents per mile quoted for the twenty-two-passenger bus. Two such buses would be equal in seating capacity to a single city forty-four-passenger car and the cost of operating two such buses, or 43.6 cents, ought to be more than ample to operate one such car to advantage. He also believed that the public would require, for its own protection, regulations for motor-buses similar to those required of other common carriers.

In answer, Mr. Hewes admitted the importance of considering the relative size of the average bus and the average railway car in making cost comparisons but cited the case of a successful interurban bus line at Pittsfield, Mass., which charged 2 cents per mile and was reported to have cleared 100 per cent in six months. The speed, however, was only 12 m.p.h.

W. B. Rockwell, Eastern Pennsylvania Railways, Pottsville, Pa., spoke of the real economy of electric power notwithstanding the large investment required, on account of the facility of distribution. The jitney from every moral aspect was thoroughly bad. In Reading the local civic society had voluntarily taken up the matter of suppressing the business. It would soon be considered a public disgrace to ride in a jitney bus.

W. O. Wood, New York & Queens County Railway, said that the railways ought to try to put themselves on the same taxation basis as the jitney and not try to put the jitneys on the railway basis.

PROTECTION OF HIGHWAY CROSSINGS

William H. Hyland, claim agent Fonda, Johnstown & Gloversville Railroad, then read a paper on highway crossings which is abstracted on another page in this issue.

In the discussion J. P. Barnes read some remarks prepared by C. R. Barnes, who in his official connection with the Public Service Commission of New York, Second District, made a special point of the fact that automobile drivers paid more attention to crossing signs put up by automobile organizations than to those put up by railway companies. He asked therefore for the appointment of a committee to co-operate with the automobile clubs of the State and with the Public Service Commission in regard to crossing protection. In response to this it was decided that the association would gladly confer on the matter whenever the Public Service Commission would call for such a meeting. Mr. Barnes also asked for co-operation in regard to existing discrepancies in the railway rules on carrying explosives, and this matter was referred to the executive committee.

Owing to the lateness of the hour the question box was omitted and the association proceeded to the election of officers, the following being unanimously elected:

President—John J. Dempsey, Brooklyn, N. Y.

First vice-president—James P. Barnes, Rochester, N. Y.

Second vice-president—Wilbur C. Fisk, New York, N. Y.

Secretary-treasurer—W. S. Stanton, Schenectady, N. Y.

Executive committee members were elected as follows: J. S. Doyle, New York, N. Y.; C. F. Hewitt, Albany, N. Y.; James E. Hewes, Albany, N. Y., and E. J. Dickson, Buffalo, N. Y.

President Dempsey was then escorted to the chair, responding with a few well-chosen words. After resolutions of thanks to the retiring president and secretary-treasurer the meeting adjourned.

THE SOCIAL FEATURES

The social features included automobile trips for the ladies, an auction bridge tournament on Tuesday afternoon, dancing after the banquet Tuesday evening, and a baseball game following the Tuesday afternoon session between the "managers" and the "peddlers." In this baseball game the managers won with a score of 15 to 10, if the official score is to be believed. The highest batting average was made by C. F. Banghart, general manager Binghamton Railway, who, in addition to making many base hits, scored a run every time that he came to the plate, which was five times during the five innings. In consequence of this achievement, he received a statue of Charlie Chaplin, which was the prize offered for the largest number of runs made by any individual player.

THE BANQUET

The banquet held on Tuesday evening was remarkable from the fact that at the speakers' table there sat four members of the New York State Public Service Commission, namely, Judge Edward E. McCall, chairman, George V. S. Williams and Robert C. Wood of the first district commission and William Temple Emmet of the second district commission. Of these, addresses were delivered by Messrs. McCall and Emmet. The banquet was attended by upwards of 200 persons and was marked by evidences of a co-operative spirit in the matter of public utility regulation. President James F. Hamilton presided as toastmaster and was very happy in his introduction of the speakers.

Commissioner Emmet discussed the regulatory situation in New York State, frankly admitting its shortcomings but expressing an expectation of fuller understanding between the utilities and the commissions. He said that regulation is not such a sore subject as it once was. While the regulatory program outlined by Governor Hughes was viewed with some apprehension it would be unthinkable now to go back to the old order. The apprehension was based upon the fear of the intrusion of politics into a field where expert knowledge was needed. There are still annoying features in regulation, but sensible men do not let these bother them. The "black horse cavalry" no longer disturbs the sleep of public utility men. Old-fashioned strike legislation has, through regulation, become a thing of the past. While regulation is not perfect its imperfections are being remedied, and the public utility men of the State and the commissioners are good friends, and friends of the principle of governmental regulation. The principal source of irritation has been due to the impossibility of staking out definitely the line of demarcation between regulation and government ownership and operation. For example, in the matter of supervision of service of street railways the commissions have sweeping powers, going into many matters of operating detail. Under the law they must give hearings on matters of this kind. It is a question whether this feature of the work should not be considered a part of the principle of government operation rather than regulation. A large section of the public expects the commissions to look after all operating details. Mr. Emmet raised the question as to whether this is a proper function for a public service commission.

In regard to the friction which has occurred in matters of regulation, all parties concerned are to blame. The sensible course for public utility men to take is

that which has been taken by the New York Electric Railway Association in the line of co-operation. Such co-operation is necessary in the solution of the problems involved. Public utility men should accept the principle of regulation, which is still in the experimental stage. While it is in this stage, inconsistencies must be overlooked. When the public comes to realize the attitude of public utility men toward regulation, many of the present problems will be solved. The public utility industry needs business men who are also statesmen. Mr. Emmet expressed the belief that regulation has seen its worst day and that a period of understanding is here.

Mr. Emmet was followed by Nathan C. Kingsbury, vice-president American Telephone & Telegraph Company, whose central thought was the need for co-operation among public utilities. He called attention to the fact that one-fifth of the wealth of the country is invested in public utilities which form a stable business necessary for the people. The margin of profit in this business is small and the problem of operating at a profit is a difficult one. Favorable conditions are necessary. A public utility corporation which is not now making money but which is serving the public faithfully can look forward with hope. On the contrary, one which is making money but which is not giving good service is doomed to failure. The men who started utilities were far-sighted, even considered visionary by some. After launching the utilities many of them stepped out, leaving difficult problems for their successors to solve. The day of these promoters has now passed but they did a good work. The speculative methods necessary in the early days are not needed now. All that is expected is a fair return. In the early days investors thought that they were investing in private business when they put their money into public utilities. It is now realized that this is not the case.

In order to improve conditions the public service corporations should get together on a co-operative basis. They have many interests in common and the public does not discriminate among them. In a community where one utility is successful others are apt to be so also, whereas the reverse of this is at the same time true. In the past public service corporations have not known each other. Now they are getting together. An example of this is seen in the co-operation which has been brought about in the use of transmission pole lines. Utilities could get together on the matter of valuation and in promoting an interest in public service commission decisions, many of which reach several utilities. The managements of the utilities must work to make the work of the commissions successful. Failure of the valuation commission work of the Interstate Commerce Commission, for example, would spell disaster to some corporations.

Mr. Kingsbury emphasized the value of the publicity clause of the code of principles of the American Association. The utilities must control public opinion through publicity. An example of large appreciation of this fact is shown by the activity of the warring governments of Europe in publishing the facts regarding the beginnings of the war. All that the war can do is to force the countries into a state of mind wherein they will give and take. When this time comes public opinion will be all powerful. Secret methods cannot be successful in public utility matters. New capital is constantly needed and if a company is not making money it cannot get capital. This fact tends to secrecy as to financial conditions, but such secrecy is not warranted. Much adverse legislation might have been prevented if the railways had practised publicity earlier.

Regulation can be overdone, and the commissions should realize the conditions under which public utility operations must be conducted. For example, the European war has made inroads on capital, the warring countries paying high rates of interest. This will make it more difficult to get capital for utilities and also for municipal and other public improvements. This is indicated by the fact that at the New York bond sale this week the city has to pay nearly $4\frac{1}{2}$ per cent for its money. While the utilities do not ask for a high rate of return, they do ask for stability and such a rate as will attract capital.

Referring again to the subject of publicity Mr. Kingsbury pointed out that the railways must have a desire to serve, and that if there is some policy which cannot be made public that policy should be abandoned. Public utility securities are widely distributed and this fact should be made known. Further, the utilities are not ashamed of the men who promoted, developed and now manage them. The public service corporations have had much to do with the beneficent development of this country. They have added great wealth to the country and have fostered a homogeneous development. They make for prosperity and peace.

Judge McCall began his address by emphasizing the magnitude of the task of operating the properties in the metropolitan district. This task he said is unprecedented. New York City is spending \$366,000,000 on rapid transit because of a realization of the tremendous growth in the demand for service. The service is not perfect, but the public insists that it should be so. Judge McCall agreed with Commissioner Emmet in regard to the separation of regulation and supervision of operation, expressing his belief that the former is the function of the commissions. He has stood for conservatism and the conservation of property rights, and has not and will not allow public clamor to trespass upon these. He had asked himself and his visitors many times why public utilities should not give good service when they have every cause to do so. He stated that much of the hostility to public service corporations does not come from the public but from interested persons. In closing he invited the association to co-operate with the commission in team work in bringing about a better understanding of the problems of regulation.

Before calling upon Charles C. Peirce, vice-president of the Manufacturers' Association, the last speaker on the program, Toastmaster Hamilton read telegrams from C. Loomis Allen and J. H. Pardee, expressing regret that they could not be present and sending good wishes for the meeting.

Mr. Peirce's plea was for appreciation of the supply men. The manufacturer occupies no small position in the public utility business. He has worked shoulder to shoulder with the pioneers in building it up. This is evident from the importance of the work done by such men as Sprague, Edison, Westinghouse and other great inventors. He also said a good word for technical journalism and the work that the ELECTRIC RAILWAY JOURNAL has done in furthering the electric railway cause. He said that the name of James H. McGraw will stand with that of other pioneers for the work that he has accomplished in developing his side of the industry. As a further illustration of the identity of the manufacturer with the electric railway, he said that while the manufacturer has worked with the railway he has also suffered with it.

After a rising vote of thanks to the distinguished speakers of the evening the banquet gathering broke up about midnight and adjourned to the dancing floor of the hotel.

WHAT CAN WE GIVE FOR A NICKEL?

With this question as the point of departure, E. G. Connette, president International Railway, suggested several of the problems involved in the furnishing of urban transportation at the 5-cent rate. The nickel was adopted as a convenient unit of exchange in carrying passengers, the distances in the beginning being very short and no transfers being issued. In the progress of time lines were extended and transfers were issued so that the payment of a 5-cent piece entitled a passenger to ride from city line to city line, in many instances from 5 to 20 miles.

"As the necessities arose for the extension of lines and franchises were sought by companies, the public authorities have been from time to time imposing additional conditions. One that is now very burdensome arose out of the conditions existing during horse-car times because the horses, traveling between the rails, wore out the roadway. The reason for this requirement has long since passed, but the burden of the expense remains. The cost of paving the so-called 'railroad strip' is represented in the 5-cent fare, while the abutting property owner receives the benefit besides an appreciation of the value of the property by reason of the street railway service. Patrons of the street railway should not be required to contribute even indirectly toward charges of this kind."

Mr. Connette also explained how the payment of percentages of gross receipts and franchise taxes, the original continuing expense due to change from horse cars to electrical propulsion, the cost of eliminating grade crossings, the advance in the costs of labor and materials; the carrying of firemen and policemen free in many communities, etc., have added to the burdens of the street railway until it now faces a crisis.

"Public service companies are now face to face with the necessity for considering seriously the question resulting from the foregoing conditions and discovering, if possible, some way in which they can either increase their return or decrease their expenditures. The problem can be approached from two points of view: (1) Should and can the unit of fare be increased? (2) Can the expenses and burdens of transportation companies be lightened so that they may continue to carry passengers for the same unit of fare and still earn a reasonable return upon the capital invested? I think it will be conceded by all that the last suggestion, if practicable, would be the most desirable.

"It seems to me that the traveling public and the company are entitled to have the rights of the parties readjusted on a more equitable basis. If the companies were permitted to receive a reasonable return upon the capital invested and then have everything over and above that expended for real transportation service for the benefit of the traveling public, eliminating and removing from the companies the burdens of tax which they now bear, which go toward purposes other than transportation, it might still be possible to continue to charge not more than 5 cents and at the same time pay a reasonable return upon the capital invested. The other alternative is to raise the unit of fare from time to time to cover the increasing expenses.

"The time has arrived to center attention on this question and evolve some plan by which relief can be secured. Under the public service commission's law as it now stands the commission has the power to regulate rates and can do much to relieve the situation if it is deemed wise to exercise that authority. The efforts of the public service companies should first be employed either to procure legislation directly relieving our properties of other burdens and costs not act-

ually involved in transportation problems or, as an alternative, endeavor to have the powers of the commission enlarged so that it may relieve the companies of these burdens in every proper case. In any event we should endeavor to make the commissioners constitutional officers so that they may fearlessly perform their duty."

JITNEY BUS COMPETITION

On the subject of the jitney bus, James E. Hewes, general manager Albany Southern Railroad, said substantially as follows:

I take the radical position that the gasoline-driven vehicle has come to stay, and that its great potentialities can be, to a certain extent, used for our own benefits. I also take the radical position that, if this new form of transportation has come to stay, we must make use of it or else compel the electrical companies, the car builders and the truck builders to give us an electrical vehicle that will compete on equal terms with this new form of competition.

One of the best types of auto-buses with which I am acquainted is a convertible twenty-two-seat, 5-ton car (loaded), having a solid tire and a pneumatic tire on each wheel. The engine is four-cylinder, 30-hp. capacity. The weight of the car is 10,000 lb., or 455 lb. of car weight per seated passenger. A first-class interurban car, seating sixty passengers, weighs 60,000 lb., or 1000 lb. per passenger.

A horsepower can be delivered to the wheel of this gasoline car, with gasoline at 15 cents per gallon, at less cost than can be done by the average trolley company that makes electric current in a power house situated, say, approximately 20 miles from the trolley car, with coal at \$3.25 per ton delivered to the boilers. A first-class auto-bus can do a car-mile at a power cost of 1½ cents. The type of auto-bus I speak of makes 10 miles on a gallon of gasoline, and the gasoline costs approximately 15 cents per gallon. Therefore, our competitor can operate a mile, can produce a horsepower where he wants it, can operate a ton-mile or a seat-mile at less cost than we can, and can carry a passenger in his auto-bus with one-half the weight that we can.

Let us now consider the item of investment and make a comparison between our competitor and ourselves, taking the item of investment as one unit, and comparing a trolley car with an auto-bus.

We pay \$9,000 for a 30-ton interurban car, with a seating capacity of sixty, equipped with four 75-hp. motors, type "M" control air brakes, lighting circuits, two trolleys, registers, etc.

A first-class auto-bus of twenty-two seating capacity costs \$4,500 complete, or just half the cost of our trolley car of sixty seating capacity, but the seat cost of the jitney is \$205, whereas the seat cost of the interurban car is \$150. The \$205 per seat cost of the jitney is all the investment that our competitor has, but our \$150 seat cost is only the smallest portion of our real net seat cost, because, after we buy our trolley car, we must build power houses, lay tracks, erect poles, pave streets, bond our tracks, equip trolley lines, construct and equip transformer stations and substations, until we have a total investment of approximately the following:

Power house cost per car.....	\$3,000
Substation cost per car.....	1,200
Trolley line cost per car.....	2,000
Track cost per car.....	20,000
Cost per car.....	9,000
Total cost of trolley car before it can run.....	\$35,200

I submit these figures only as a basis for comparison of first cost, and primarily to draw attention to the fact that our first cost, reduced to a seat basis, is vastly

greater than that of the first-class auto-bus. If the depreciation of the bus were at the rate of 33 per cent and the depreciation of a complete trolley system were but 10 per cent per annum, including obsolescence, the bus would, nevertheless, show a total depreciation less than ours, because 33 per cent of \$4,500 is \$1,485, whereas 10 per cent of \$35,000 is \$3,500.

Now, the bus has been made possible only by reason of the improved roads, built at the expense of the state and county. It has also been made primarily possible by the great economic development of the gasoline motor and the remarkable development of the automobile chassis. And we are confronted with the fact to-day that the average automobile is a higher development of mechanical principles than the trolley car. The tendency of our electrical engineers is to make our equipments of greater capacity and greater weight. The tendency of the automobile manufacturers is to reduce the amount of horsepower and lighten the weight of their automobiles. We must look to the electrical engineers to help us solve our problem. Our car builders must create a revolution in the car if they wish to stay in the game. Otherwise the electrical engineers and the car builders will be in the same position as we will be, namely, looking for other jobs.

I believe, as I have stated before, that gasoline transportation has come to stay, and that we should make use of it at first, or experimentally, as an auxiliary or aid in the development of our traffic. Where we seriously consider extensions to our lines, we can well use the gasoline vehicle, not paralleling our traffic, but beginning at the ends of our lines and transferring passengers to the extension territory, until the traffic becomes sufficiently reliable and congested to warrant the installation of tracks and trolley.

Other uses for the auto-bus by trolley companies would be in locations where there is considerable distance between our parallel tracks in congested districts that invite the jitney. In such districts it is well to consider the possibilities of the auto-bus, because in such localities the jitneys take away a permanent form of traffic.

By using the auto-bus to the extent cited, we will immediately win back the nickels we have lost and will do more than anything else to discourage jitney-bus competition and to prevent capital entering this field, because the jitney thrives best in a field originating in a congested district and paralleling our lines, and by carrying passengers to points beyond our track limits.

Few of our passengers would take a jitney-bus to points beyond our lines if they could ride in comfortable cars to our track limits and then be carried to points beyond in a comfortable, well-equipped auto-bus operating on a regular schedule. One such bus, by making frequent short trips, would replace many buses making a long trip.

Generally speaking, an electric traction company, if it used an auto-bus as an auxiliary, would discourage competition on any extensive scale, and would prevent organized incorporated capital from entering the field, which is the most dangerous feature of this form of competition. Most of the jitney competition is now in the hands of "shoe-string" capitalists, but when organized capital enters the field we will have to fear the worst. If, however, we make use of the gasoline auto-bus as an auxiliary, organized capital will be slow to enter the jitney-bus field.

We have, indeed, a serious problem to consider. There never was a time in our history when we were confronted with a problem that required us to make greater efforts to accomplish economies, and to combine our great capital to prevent further inroads into the

field. We must organize our capital to prevent organized capital from entering the field of competition; we must combine our legal talent to have enacted such laws as will place our competitors on an equal basis with us; and we must enlist the combined talent of the electrical engineers and the car builders to give us a vehicle that will place us on an even footing with the jitney-bus competition.

I will say, in conclusion, that the total cost, including fixed charges, for operating an auto-bus-mile for a bus having twenty-two seats, based upon an annual bus-mileage of 30,000, is 21.8 cents per mile. There are few electric roads that can equal this. For over ten years more passengers have been carried by buses in London than have been carried by trolley lines. The service is just as good and as regular. When London got the bus habit, and the buses became popular, the capitalists owning surface trolley lines promptly unloaded them on the city and obtained exclusive franchises to operate the bus lines.

THE CENTER-ENTRANCE CAR FOR CITY AND SUBURBAN SERVICE

An account of the center-entrance car for city and suburban service was given by W. G. Gove, superintendent of equipment Transit Development Company, Brooklyn, N. Y., but as this car has been fully described in these pages, the technical features of this paper will not be furnished here. Mr. Gove concluded his remarks as follows:

One hundred and one cars of the center-entrance type have now been in service on the Brooklyn Rapid Transit system for over two years, and the results obtained have been very satisfactory. The principal advantage of this car is the reduction in boarding and alighting accidents, due to the doors being closed at all times when the car is in motion.

The following table gives a comparison of boarding and alighting accidents per 1000 car-miles for three different types of cars, operated on the same lines during the last calendar year:

Type of Car	Accidents per 1000 Car-Miles
Closed, semi-convertible and convertible.....	0.11
Open	0.26
Center-entrance	0.03

Another operating advantage of this car is its ability to carry an increased number of passengers with a decreased number of cars. This is accomplished by the shorter stops required, as passengers are entering and leaving at the same time, and by the increased seating capacity. On one line it was possible to make a reduction of seven cars per day on the schedule, or 190 trips and 24,142 ton-miles, with an increase in seat-miles of 45,022.

When the cars were first placed in service it was thought there might be some slight delay at terminals in loading and unloading passengers and in collecting fares as passengers entered. This has not been the case. At the Park Row terminal of the Brooklyn Bridge the passengers are allowed to board through both entrances and exits on one side of car, after all passengers have alighted from the opposite side. Fares are collected as the car is crossing the bridge.

At Borough Hall and Atlantic Avenue, the only two heavily congested points in Brooklyn, passengers are prevented from entering by way of the exits by two inspectors, one located at each exit, who also assist passengers to board the car. Fares are collected as passengers enter, but transfers are not issued until after the car starts. By this arrangement no delays are occasioned and schedules are easily maintained.

The light weight per passenger-seat is also an item not to be overlooked. This is saving money, not only in power consumption, but in wear and tear on equipment and roadbed.

THE PROTECTION OF INTERURBAN RAILWAY HIGHWAY CROSSINGS

In introducing this subject for discussion William H. Hyland, claim agent Fonda, Johnstown & Gloversville Railroad, first outlined the relation of the growth in automobile traffic during seventeen years, in which period the number operating in New York State has increased from forty-five to 150,000. At the same time the possible speed has increased from 25 m.p.h. to very high values. He stated further in substance as follows:

The qualifications necessary for operating an automobile in the State of New York do not include that of normal vision. Any person who can purchase an automobile, or any member of his or her family, even though partly deaf and with impaired vision, is allowed to operate automobiles upon the highway. There is a striking contrast between the requirements for driving an automobile and an interurban car. The motorman of today must not only be sound of body, but he must have perfect vision and hearing, tested by a competent physician every two years and after any severe illness. Much responsibility naturally rests upon the motorman, and for this reason the greatest care is exercised in selecting him. It should be quite comforting to nervous people to know that out of every 100 men who enter the train service only twenty become motormen, and only five of this number become motormen of interurban cars. The motorman is thoroughly trained to meet every emergency, and his efficiency is as carefully looked after as that of anything upon the railroad.

There are differences of brain power, taste, aptitude, physical power, mental strength, moral force and vision. With these inherent differences there must be different results. These great differences among men are the causes of many accidents at highway grade crossings. Whichever way we turn we find signs safeguarding the grade crossings. It is, however, impossible to get away from the personal equation. Frequently an eye fails to locate and measure correctly the position and speed of an approaching car; an ear fails to hear the warning bell or whistle; a hand fails to stop the horse or slow down the automobile, a mind goes "wool gathering" for a moment, and here we have, I believe, the cause of 95 per cent of our grade-crossing accidents.

With the advent of the automobile, railway companies caused signs to be erected facing the highway at points well back from crossings. These signs urged drivers of automobiles to slow down and look out for the cars. Crossing signs were illuminated so that they who ran, even in the dark, could read. Wherever possible, trees and buildings which in any interfered with a clear view of the tracks from the highway were purchased by railroad companies and removed. Of course, all highway grade crossings are dangerous places, but some crossings are safe as compared with other crossings. At the more dangerous crossings—that is, where people, on the highway, by looking cannot see and by listening cannot hear approaching cars—cars are stopped before crossing the highway. The whistle is sounded and the bell is rung. In fact, everything that railroad companies can do to safeguard the lives of people on grade crossings is done, but all the precautions in the world will not save the lives of those who drive vehicles recklessly over railroad crossings.

Acquiring definite information is, of course, the chief reward of all systematic reading and thinking, and in these days, when knowledge means much, this is

important. It is especially important when the knowledge gained is on a practical subject, like the one in question. However, I really believe that if the managers of railroad companies should withdraw their attention from all other matters and center it upon the subject of the protection of highway grade crossings, they could learn nothing that they do not already know. The need of the railroad manager is not more information from the claim department upon this subject, but, on the contrary, it is money with which to eliminate these dangerous places. To obtain the money with which to do this most important work will depend largely, I believe, upon the attitude of the public toward railroad corporations.

The railroad is the partner of the business man. Partnership implies working together for a common end, and when the partners shall have viewed this subject from the same angle, railroad managers will have money with which to eliminate these dangerous crossings, and not before. Railroad companies are doing everything in their power to safeguard crossings, through men and machinery and by the posting of large signs, warning automobilists to look before crossing the track. They are doing their part and should at least receive due credit for their efforts and improvements.

A Remedy for Dusting Concrete Floors

At a recent meeting of the American Concrete Institute the question of eliminating the dusting of concrete floors was brought up for discussion. This problem is of particular interest to electric railways because of the generally adopted practice of using concrete floors in shops, carhouses and power stations. In this discussion it was brought out that more than thirty different methods had been attempted to eliminate this undesirable characteristic, but only two or three had been found at all satisfactory. Silicate of soda was included among those proprietary remedies which had given fair results. A better remedy, however, was discovered twelve years ago when the dust on the floor of a generating station damaged the bearings of some of the machines. A coating of linseed oil was applied to eliminate the cause of the trouble. In this case raw oil was used and the excess wiped off with waste, but later developments have demonstrated that boiled oil was better than raw oil, since it dried more quickly. One objection to the oil was that it produced a mottled appearance due to unequal absorption, but this undesirable feature has been overcome by the inclusion of lamp black, which gave the floors so treated a uniform slate color.

It was generally agreed that dusting of concrete floors was the result of using a mixture too rich in cement, or sand of too fine grain. Both of these causes are readily obviated by the use of a coarser and harder sand, or even crushed granite screenings in the wearing surface, and by a reduction in the quantity of cement. The more recent introduction, however, of fine iron and steel filings into the cement used in the wearing surfaces of floors is meant to attain the same end, and logically there is no reason why it should not. Another precaution employed to improve the wearing quality of concrete floors is to use only enough water to make the surface trowel without undue effort. It should also be allowed to cure for at least ten days, during which time it should be sprinkled frequently to complete the hydration of the cement.

The Cleveland, Southwestern & Columbus Railway, which adopted Eastern time shortly after Cleveland made the change, has returned to the use of Central standard time. None of the other towns and cities on its line used Eastern time.

COMMUNICATIONS

The New York Jitney Law

INTERNATIONAL RAILWAY COMPANY,
BUFFALO, N. Y., June 28, 1915.

To the Editors:

I notice a statement in the table on page 1224 in the ELECTRICAL RAILWAY JOURNAL for June 26, that the New York law regarding jitneys provides "that no jitney shall operate until the owner has procured the consent of the local authorities and has executed a bond in an amount fixed by said local authorities."

The law goes further than this. It also provides that they cannot operate until they have secured a certificate of convenience and necessity from the Public Service Commission, and in order to get this it will be necessary for any jitney operator to show by testimony under oath at a regular hearing before the Public Service Commission that the service is a public necessity and convenience.

E. G. CONNETTE, President.

Rating of Railway Substation Machinery

NEW YORK, N. Y., June 30, 1915.

To the Editors:

Your editorials on "Continuous vs. Normal Rating of Railway Substation Machinery," with their advocacy of continuous instead of nominal rating, suggest the desirability of introducing another factor into the rating of duty-cycle machines, or those whose cycle of load repeats itself with more or less regularity.

The heat generated in an electrical machine is primarily expended in raising its temperature. The greater the heat capacity of the machine, the more heat will be required to raise its temperature a given number of degrees, or, to put it another way, the greater the heat capacity, the less will be the temperature rise with a given expenditure of heat. As soon as the temperature begins to rise, however, the heat no longer confines itself to raising the temperature of the machine, as part of it is dissipated in the air by radiation and convection. At first the heat dissipation will be unimportant compared to the heat absorption, but as the temperature rises, it assumes increasing importance until, at a certain temperature, the rate of dissipation equals that of absorption. This is the temperature at which the machine will run continuously with the energy losses assumed. The greater the heat-dissipating ability of the machine, the less the temperature rise in continuous operation or, to put it another way, the greater the dissipation the greater may be the energy losses for a given temperature rise. It is therefore obvious that the fundamental characteristics of a machine, from the point of view of heating, are its thermal capacity and its thermal dissipation quality.

The continuous rating of a machine, being a measure of its thermal dissipation, is a perfectly satisfactory measure of its capabilities under practically constant load conditions, such as occur in lighting stations. In railway substations, however, the fluctuating character of the load renders the continuous rating less complete as a measure of capability, and necessitates an additional rating which will measure the capability of the machine to absorb the heat generated by heavy loads of short duration. The rating which accomplishes this is the thermal capacity.

Unfortunately, the thermal capacity has not been standardized as a rating. True, it is mentioned in an appendix to the 1914 Standardization Rules (Section 447), but only in connection with railway motors.

The nominal rating is a rather abortive attempt to combine the thermal dissipation and thermal capacity in

one figure. Such an attempt is like trying to define a parallelogram by giving its area only, without reference to its shape. In either case the combination of the two quantities into one makes the rating fit innumerable cases. For example, a machine of high thermal capacity and low thermal dissipation may have the same nominal rating as a machine of low thermal capacity and high thermal dissipation. The two machines will be of radically different design, suited to entirely different services, but will have the same rating.

The thermal capacity depends upon the amount, disposition and specific heat of the materials of which the machine is composed. The thermal dissipation depends upon the ventilation, the areas of heat-dissipating surfaces and the specific radiation of these surfaces. How can these two distinct properties of a machine be put into the rating?

An answer to this question is suggested by a consideration of the curve of temperature rise of a machine

RATE OF TEMPERATURE
RISE IN ELECTRICAL
MACHINERY

operating at any constant load. The form of such a curve is shown by the accompanying sketch, from which it will be observed that during the early stages of the run, the temperature rise follows an almost straight line law due to the fact that practically all the heat generated is used in raising the temperature of the machine.

Later the curve bends over due to the increase of heat dissipation as a machine becomes hot. The thermal capacity of the machine is proportioned to the slope of the straight line part of the heating curve with respect to the vertical axis. Thus if the mean temperature rise in t hours is T degrees with a constant load, giving a loss of P kilowatts, the thermal capacity will be Pt/T kilowatt-hours per degree rise. The ratio t/T which gives the slope of the curve with respect to the vertical axis, may be determined by stopping the heat run after, say, fifteen minutes and taking temperature readings. Assuming that this plan is practicable, we would be equipped with a measure of the thermal capacity of the machine which may then be used to determine its capability for carrying overloads for short periods. It is unnecessary to enter into the details of how this is done, but let it suffice to say that if we are provided with a load diagram and the thermal characteristics of the machine, it is an easy matter to plot a curve of temperature rise, no matter how complicated the diagram.

The practicability of determining the thermal capacity as here outlined is, perhaps, open to doubt, due to the uncertainty of the temperature rise, which will probably be a small quantity and due to the uneven distribution of heat in the machine. There is, however, sufficient promise in the plan to warrant careful investigation. The standards committee of the A. I. E. E. has given the matter considerable thought, but received little or no encouragement from the railway men. I wish to commend the subject to the attention of electric railway engineers in the hope that a demand will arise for the rating of railway machinery in accordance with its thermal characteristics. The adoption of the continuous rating will supply one of the two necessary ratings. Is it not time for us to talk for the other?

WILLIAM L. DEL MAR.

The Chicago (Ill.) Tunnel Company has issued an elaborate folder entitled "Lifting the Lid in the Loop" for the purpose of acquainting the public with the property and the benefits derived by shippers and the city at large through the tunnel.

OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Under the Auspices of the A. E. R. A. and N. E. L. A. a Meeting Is Held in Manila at Which Public and Private Ownership of Utilities Is Discussed—Committee and Section Activity

COMMITTEE ON UNIFORM DEFINITIONS

The committee to develop uniform definitions of the American Electric Railway Transportation & Traffic Association met at the headquarters in New York on June 25. The following were present: H. C. Donecker, chairman; William C. Greenough and Frederic Nicholas. The committee went over in detail the definitions reported by the 1913 committee on the same subject and definitions contained in the 1911 report of the committee on construction of schedules and time-tables, and also considered suggested changes and additions.

The definitions, which have been reported to the association but not yet adopted formally, will be considered carefully by the members of the committee in comparison with definitions contained in the reports of the committees on rules and construction of schedules and time-tables and the joint committee of the Engineering and the Transportation & Traffic Associations on block signals for electric railways. Several of the terms which have been defined tentatively are of equal interest to allied associations and in order that the definitions may be satisfactory to each department of operation concerned, the committee will ask for the appointment of joint committees to act on these matters. Several additional terms were suggested for definition. The committee will hold another meeting on July 13.

GOVERNMENT OWNERSHIP DISCUSSED IN MANILA

As announced in the issue of the ELECTRIC RAILWAY JOURNAL for June 26, page 1211, the May meeting of the joint Manila Electric Railroad & Light Company section of the American Electric Railway Association and the National Electric Light Association was devoted to the subject of the relative advantages and disadvantages of private and government-owned public utilities. A paper with this title was presented by W. R. McGeachin, manager of the railway department of the company.

Mr. McGeachin's paper was based upon quotations from a number of important articles and reports. He first stated that while theoretically government ownership of all public utilities is the ideal condition, the principal argument against the public ownership of certain utilities is that the basic political and social conditions under which these utilities have existed and do exist are not ideal. This is not a theoretical reason but, being based on practical results and existing conditions, furnishes an all-powerful and irrefutable argument. Mr. McGeachin quoted from the National Civic Federation report giving the results of the investigation conducted by that body during 1905 and 1906, from the report of W. D. Mahon and L. D. Bland to the Amalgamated Association of Street & Electric Railway Employees of America in 1914, from an address on European public-utility conditions by W. J. Clark of the General Electric Company, from the proceedings of the conference of mayors held in Philadelphia last year and from the code of principles of the American Electric Railway Association. Abstracts of these various statements can be found in the file of the ELECTRIC RAILWAY JOURNAL.

In the discussion of Mr. McGeachin's paper L. L. Vincent, superintendent of electric testing of the com-

pany, expressed the belief that in America the people are willing to give private owners of public utilities a chance to earn a reasonable return on their investment, provided satisfactory service is furnished and that the code of principles of the association, when applied, will have the effect of educating the people generally and preventing hostile agitation. He considered the American Telephone & Telegraph Company's experience with publicity to be typical of the effects of frank publicity.

Clifford H. French, auditor for the Philippine Islands, referred to the fact that the incentive of profit is absent in public operation of utilities. Recent inquiries in China showed him that the operation of the railways by the government was more or less of a failure because the government could not pay suitable salaries to keep employees in a contented state of mind. He believed that no present government is organized on a basis of efficiency as compared with great representative corporations.

M. F. Loewenstein, president Pacific Commercial Company, referred to the difference between a Canadian Pacific train and an Inter-Colonial train as they stood side by side in the station at Montreal. As a result of the comparison he did not favor government ownership of railroads as much as he had done previously. He instanced the government ownership and operation of steam railroads in Australia where on one trip he was obliged to ride on three different trains, as one road had a narrow gage, one a standard gage and one a broad gage. He considered that the public ownership and operation of street railways in Sydney was satisfactory and noted that a long ride was given for a penny. Comparatively unsatisfactory conditions in Melbourne were explained by the fact that the company's franchise was about to expire and for that reason needed improvements were not attempted.

H. M. Pitt, president of the Manila Merchants' Association, stated that government at best is a cumbersome affair, and if it is possible to relieve it in any way of its multifarious duties it is good for the government and the public to do so. He stated that the government operated the ice plant in Manila under compulsion as the plant was built by the military government and was turned over to the civil government. For years the ice plant maintained a price for ice that was out of all reason, and it never reduced the price until the private companies did so after getting into a fight among themselves. Governmental ownership and operation of the ice plant in Manila is hardly a criterion of the success of such ownership of utilities.

The political aspect of the question was pointed out by M. D. Royer, traffic manager of the Manila Railroad Company, a steam railroad. He referred to the differences in conditions with regard to government ownership in European countries and the United States, and especially with regard to the possibilities of political control under government ownership. Conditions in the United States at this time do not warrant such ownership.

The experience of Japan in government ownership was outlined by Y. Mikami, manager of the Mitsui Bussan Kaisha. He said that the cumbersomeness of governments had been proved, and therefore the less the governments do the better for the people. In Japan it was necessary in many cases for the government to

inaugurate public utilities in order to have them, and principally for this reason the people of Japan advocated such ownership, but this does not prove anything. It is not surprising that in the United States, where the people are more practical than any other people in the world, public utilities are generally privately owned.

George H. Fairchild of Welch, Fairchild & Company, sugar planters, in referring to his experiences on government-owned railroads in Europe said that the service given by them was inferior to that furnished by the American railroads.

In closing the discussion C. N. Duffy, vice-president of the company, said that the people who advocate government ownership and operation are usually non-taxpayers. Speaking as a taxpayer he felt that whenever a government can or does operate public utilities as efficiently and as economically as a private company can and does, then and not until then is it time to take up the question for consideration. The men engaged in the public-utility business are performing a public service and are doing presumably what the government could not, or would not, undertake to do. He instanced the local electric railway, light and power system. The real reason for the success of privately-owned public utilities, and for the failure of government-owned public utilities, lies in the fact that in the latter there is no hope of individual financial reward, the personality of the man is lost sight of, and the individual's right to assume authority and discharge responsibility is hopelessly entangled in masses of red tape.

Referring to the advocacy of government ownership and operation of telephone and telegraph lines by the Postmaster-General of the United States, he called attention to the fact that the Postmaster-General also advocated the operation of rural free delivery postal service privately, as it had cost the government during the last fiscal year \$56,000,000 whereas the service could have been performed privately for \$20,000,000.

Mr. Duffy did not favor limited franchises for privately-owned utilities but preferred the indeterminate permit. He said that the franchise granted by the Philippine Legislature, recommended by the Board of Public Utility Commissioners for the Philippine Islands, for a hydroelectric plant on the Caliraya River was for a term of ninety-nine years. The government reserved the rights under certain conditions to purchase the property within twenty years after the plant began operation provided that the actual cost should be paid, plus 10 per cent, and plus such additional amounts as would equal the return in cash equivalent to an average of not less than 10 per cent on such actual cost for each year during the period of operation after adequately providing for maintenance and depreciation of the property and safeguarding the investment.

Referring to Mr. Loewenstein's impressions of railway service in Sydney, Mr. Duffy remarked that if the speaker had been called upon to pay in taxes his share of the deficit resulting from the operation of the street railway system his impressions might be different. In conclusion, he said that no privately-owned public-utility company, no investor in any such company and no employee in any such company objects to regulation that means fair treatment and protection to the interests regulated; that such regulation makes a privately-owned public utility stronger and better in every way and is best for the public; that the advanced and progressive privately-owned public-utility company knows full well that if it does not conduct its business according to business principles it cannot, will not and should not succeed and that the privately-owned public utility that gives the best service practicable at the least cost and that serves the public best, serves itself best.

CHICAGO ELEVATED SECTION

Financing electric railways, signals and interlocking were the subjects discussed at the meeting of the Chicago Elevated Railroad Section of the American Electric Railway Association held on June 22. When President Johnson called the meeting to order there were 110 members and guests in attendance and Secretary Smith reported sixteen new applications, which made the total membership 169. In the business session before beginning the regular program, it was suggested that an official pin cheaper than the one adopted should be available for those who could not afford to buy a gold one. This matter will be taken up with the parent association for action.

E. A. Brion, comptroller of the Chicago Elevated Railways, spoke on "How Funds Are Provided for Electric Railway Development." He described the different classes of securities employed, the manner in which they are marketed and the desirability of the various classes. It was shown by concrete example how the return on the various classes of securities varies with their safety and how the demanded return on all securities is steadily advancing. Mr. Brion also spoke of the holding company and its purpose, as well as the various factors which affect the marketing of the securities.

A talk on "Signals and Interlocking" was given by J. W. Stephenson, signal engineer of the company. The history of signal development was outlined beginning with the installation of the red ball at the crossing of the New York, New Haven & Hartford and the New England Railroads at Hartford, Conn., in 1852. Various types of interlocking machines installed on the Chicago Elevated Railroads were described, and the members were informed of several features which were developed on the company's lines, such as the "hesitation" frogs and the detector route locking.

"The Life of Treated Gears and Pinions" was the principal subject brought out by the Question Box and this was discussed at length. It was decided that this would be the last meeting before the summer adjournment. It is believed the section will be kept very much alive during the summer by the activities of the members who desire to be elected as delegates to the national convention at San Francisco.

The Anthony N. Brady Memorial Medals

The American Museum of Safety is sending to electric railways accident report forms for use in the competition for the Brady memorial medals which were awarded last year for the first time to the Boston Elevated Railway, Russel A. Sears and Henry V. Neal. The committee for formulating the conditions of competition comprise Arthur W. Brady, president Union Traction Company of Indiana, chairman; Wilbur C. Fisk, president Hudson & Manhattan Railroad; C. S. Sergeant, vice-president Boston Elevated Railway and W. H. Tolman, secretary, director American Museum of Safety. The committee on awards consists of Bion J. Arnold, chairman Board of Supervising Engineers, Chicago Traction; Hon. W. J. French, commissioner Industrial Accident Commission, State of California; James H. McGraw, president McGraw Publishing Company; Frank J. Sprague, New York; Prof. George F. Swain, chairman Boston Transit Commission, and Dr. W. H. Tolman, secretary.

The conditions of the competition are substantially the same as last year, but they have been improved in detail in accordance with suggestions received by the committee. They are contained in a circular published by the American Museum of Safety, 14 West Twenty-fourth Street, New York.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Furnace for Heating Soldering Irons

BY R. H. PARSONS, ELECTRICAL FOREMAN

The gas furnace illustrated in the accompanying drawing was designed for use in heating soldering irons and solder pots in shops where a number of men, say from six to ten, are winding, repairing and bending armatures. It is a home-made furnace set up in the following manner:

The stand consists of a piece of 6-in. pipe, 30 in. long, with a table welded on the top and a base welded on the bottom. The table is 30 in. long, 24 in. wide and

FURNACE FOR HEATING SOLDERING IRONS

$\frac{1}{2}$ in. thick. The base is somewhat smaller and is imbedded in the concrete floor a few inches below the surface.

On the table is a cast-iron box, housing the burners, and consisting simply of two sides with a heavy, removable top, the whole box being in two parts held together by dowel pins. The top may thus be lifted off to expose the burners. The division of the box into two sections also gives a convenient means for replacing the small bars which are provided over the burner to support the irons. As these are in the flame they warp and have to be changed occasionally. The provision of the removable top also makes the furnace available for heating solder pots, boiling water, heating irons for light blacksmith work, etc.

The burners are U-shaped loops of half-inch pipe perforated with $\frac{1}{8}$ -in. holes. They are laid together in the overlapping position shown in the diagram. Two $\frac{3}{4}$ -in. pipes, one each for air and gas, are brought up from below the floor through the stem to a large opening near the top whence they lead to the burners. A

valve is inserted in each pipe just below the table. Fastened to the flat iron top on each side of the burner is a bar, shaped to form a rest for the soldering-iron handles.

In designing this furnace, economy, neatness, convenience and safety were the considerations. The use of one central furnace does away with numerous individual fires, thus economizing fuel and insuring more nearly continuous use of the one fire. The inclosing of the pipes in the stem conduces to neatness, and the furnace is adapted to be centrally located for easy access by the users. The elimination of many small fires is conducive to safety and as this outfit is entirely of iron it is inherently fire proof.

Testing Corner in Atlantic City Shops

BY GEORGE F. FABER, GENERAL SUPERINTENDENT ATLANTIC CITY & SHORE RAILROAD

For the purpose of making the standard as well as special tests of electrical equipment, the arrangement of apparatus shown in the accompanying illustration has been adopted. At the left is shown an 1100-volt transformer used for break-down tests and beneath it a transformer and wattmeter board on which is an a.c. watt-hour meter and alongside it a switch in the low-voltage a.c. circuit leading to the transformer, by opening which the a.c. line to the main switchboard is killed.

TESTING CORNER IN ATLANTIC CITY & SHORE RAILROAD SHOPS

The principal instruments and switches are grouped on a small home-made switchboard consisting of two marble panels, which happened to be on hand, mounted on an angle-iron frame.

At the top of the board is a d.c. circuit breaker, to the right of which is a snap switch and pair of terminals for the d.c. voltmeter. In the center at the right is a d.c. ammeter arranged with shunts for reading either

100 or 1000 amperes. The range is controlled by two single-pole switches which short-circuit the respective shunts. The low-amperage switch is to the left of the ammeter and the high-amperage switch below it. To the left of the d.c. ammeter is a 60-amp. a.c. ammeter with a short-circuiting switch immediately beside it. Below the a.c. ammeter is the main a.c. circuit switch with fuses, and at the bottom of the board is a double-pole double-throw switch, connected in one direction for the field test and in the other for the armature test. Connections to the equipment under test are made from behind the board.

Immediately below the board is a water rheostat, consisting of an iron terminal plate suspended in an oil barrel concreted in for permanency. The barrel is provided with a drain pipe at the bottom so that the standing water may be changed as often as desired. The position of the terminal plate is controlled by a rope running over a drum on the back of the board. The drum is rotated by means of a small hand wheel on the front of the board. A weight is used to counterbalance the plate.

On the stand in front of the switchboard is a transformer for testing field coils for short circuits, consisting of a laminated iron core with a primary winding, the coil under test forming the secondary. The illustration shows the field coil of a Westinghouse No. 68 motor ready for short-circuit test, while the armature of the same motor is on the stand at the right ready for current and insulation tests. In addition to the test set described we have a K-36 controller mounted with circuit breaker and resistances for complete test of motors before they are installed on the trucks.

The testing equipment described above is used for making the following routine and special tests: 1100-volt a.c. insulation tests on armatures and other apparatus; a.c. field tests for "shorts"; a.c. armature tests for "shorts"; d.c. circuit-breaker tests; ohmic resistance tests of any apparatus, and in general any other a.c. or d.c. tests requiring large or small current. While I am aware that test sets are installed in most of the larger electric railway shops throughout the country, I believe that the arrangement of this one will be of interest as it is quite complete.

Ventilation Holes in Motor Frames

BY F. A. MILLER, SUPERINTENDENT POWER AND EQUIPMENT
OAKLAND, ANTIOCH & EASTERN RAILWAY

R. H. Parsons' article in the issue of the *ELECTRIC RAILWAY JOURNAL* for June 19, on "A Simple Ventilating Scheme for Increasing Motor Output" recalls to the mind of the writer similar work which was carried out when he was with the Puget Sound Electric Railway in 1911.

The company had in service a number of GE-66 motors geared 47:37. The operating conditions of these motors were so severe that with an outside temperature of 34 deg. C. the internal temperature of the motors ran as high as 105 deg. between the field poles. These high temperatures caused the melting of the solder in the rear-end clips of the two-piece armature coils, necessitating rewinding.

We therefore removed the standard handhole covers and replaced them with pieces of sheet iron in which 9/16-in. holes had been perforated at about the same distance between the edges of the holes. With the perforated covers substituted for the top handhole covers alone, the maximum temperature dropped to 77 deg.; and with the top, back and bottom handhole covers perforated, the temperature fell to 60 deg. and even to 55 deg. C.

A Home-Made Wheel Grinder

BY GEORGE G. MORSE, SUPERINTENDENT OF RAILWAYS,
EL PASO (TEX.) ELECTRIC RAILWAY COMPANY

The accompanying photograph shows a device made in our shops for grinding wheels. This consists of a 1-hp. motor, with an emery wheel attached, fitted to the tool holder of our 36-in. wheel lathe. This attachment is secured to the tool holder by four bolts so that it can be removed quickly when necessary. We are, of course, able to grind but one wheel at a time with this device.

EL PASO RAILWAY HOME-MADE WHEEL GRINDER

The average time required to grind a pair of wheels is from two to three hours, depending on how badly they are skidded. We have been using this device since January, 1914, grinding from one to four pairs of wheels per month. We have lately used it for truing up steel wheels where there was a slight difference in diameter and in case the flanges did not require turning. The entire cost of this installation was \$50, including the cost of a second-hand motor.

Emergency Truck Changing at Los Angeles

The accompanying cut shows a vehicle used by the shop forces of the Los Angeles Railway. This is used to carry a completely-equipped motor truck which is always ready for emergency replacements at the call

DOLLY WITH COMPLETELY EQUIPPED MOTOR TRUCK FOR
EMERGENCY REPLACEMENTS

of the chief dispatcher. The dolly is supplied with a skidby means of which the replacing truck is readily lowered and the defective truck raised to the platform for return to the shops.

Making the Standee Comfortable

A patent, No. 1,142,867, has been issued by the United States Patent Office under date of June 15, 1915, which proposes the separation of surface-car interiors into small sections or units each providing standing space for a limited number of passengers. By segregating each unit every individual within such a space has a place from which he cannot be crowded and at the same time the railings surrounding the unit provide him with a firm and natural support during his ride.

The accompanying Figs. 1 and 2 show plans of a center-entrance motor car having an aisle which is off the center line of the car and thus provides room for the series of units along one side of the car. The units

FIGS. 1 AND 2—PLANS OF TYPICAL CENTER-ENTRANCE CARS SHOWING LOCATION OF RAILWAYS BETWEEN COMPARTMENTS

are separated from each other by horizontal pipe railings which are set about waist high and which may take either the form of an attachment to a vertical stanchion at the seat line or else continuous railing running horizontally from the car side to the center line. Wooden partitions are suggested for use in some cases.

The plan shown in Fig. 2 differs from that shown in Fig. 1 only in having the single seats arranged in tandem. The latter feature, by locating the foot space

FIG. 3—CROSS-SECTION OF CAR SHOWING ARRANGEMENT OF RAILINGS

for seated passengers between the cross-seats, makes available for standing passengers a corresponding space in the aisle, and in addition insures those who occupy the cross-seats from close contact with those who stand. In Fig. 1 the plan provides for two seated passengers and four standing passengers in each unit. The inventors believe that this arrangement will prove superior to the use of both hand straps and stanchions because the horizontal partitions between the units will provide definite support for standing passengers at the proper position. It is also believed that the race for vacant seats which is a conspicuous and unpleasant feature of modern rush-hour travel will be eliminated, because passengers who have once gained a standing place within a given compartment acquire a natural right to vacancies within their compartment.

Differential Gears to Eliminate Rail Corrugation

For a number of months the Huddersfield Corporation Tramways, Huddersfield, England, has had in operation eleven cars fitted with differential driving gears. These cars have been operated on track which was formerly subject to corrugation, to the exclusion of other cars, to determine primarily the effect of eliminating wheel slippage. Incidentally information was desired upon the subject of energy consumption and life of tires with wheel slippage eliminated. It was the theory of R. H. Wilkinson, general manager and engineer of the tramways, that corrugations are caused by skidding and slipping of the wheels due to unequal diameter. If this theory is correct the elimination of slipping should have beneficial effects in the three di-

DIFFERENTIAL GEARS—SECTION SHOWING DETAILS OF CONSTRUCTION

rections indicated. Experience thus far has shown very satisfactory results as regards corrugation and tire wear, although there have been no appreciable energy savings. The cars are running on rails which were corrugated by cars of the ordinary fixed wheel and axle type. For the purpose of the experiment the corrugations were carefully ground out.

The construction of the differential gear can be seen from the illustrations. Referring to the line cut it will be noted that a differential driving axle gear is substituted for the ordinary gear one side driving the near wheel through a bevel gear mounted on the extension of its hub, while the other side drives the far wheel through the axle, which carries a similar bevel gear mounted on a collar forming an integral part of the axle. By this drive each wheel takes a speed determined by its circumference. The axle is carried in ordinary bearings. The wheels differ from the standard wheels in that they are straight rather than dished, in order to bring the tread and point of support more directly under the center of the length of the wheel boss and bearings,

DIFFERENTIAL GEARS—COMPLETE GEAR ON CAR AXLE

the better to support the axle equally over the full length of the boss bearings, giving parallel wear of bush and axle by approaching center running.

It will be noted that the wheel near the differential gear is mounted loose on the axle, the hub being bushed with a bronze bearing, while an extension of the hub carries the bevel gear. The appearance of the gear as attached to the wheel is shown clearly in one of the half-tones. The main spur axle gear is also loose on the axle and is similarly bushed. It consists of a cast-steel rim with machine cut teeth mounted on a cast-steel center which carries four bevel pinions meshing with

DIFFERENTIAL GEARS—SPUR GEAR WITH BEVEL PINIONS, AND BEVEL GEAR ON WHEEL HUB

the aforesaid bevel gear. The second bevel driving gear is bolted to a collar which is forged on the axle. All of these parts are securely bolted together with driving-fit bolts.

A thrust collar, made in halves bolted together, fits snugly into a groove in the axle on the outer side of the wheel, to take the thrust of the bevel gears. This construction permits the easy removal of the gears so that they may be lined up in case of wear.

The experiments which are being made with these differential gear drives should be of great value in settling questions as to the causes of corrugation, the effects of wheel slippage on curves, etc., and the effect on tire wear of inequalities in wheel diameter.

All-Steel Cars for London & Port Stanley Railway

Five cars for the London & Port Stanley Railway have recently been completed by the Jewett Car Company, the design providing for service in accordance with the highest interurban standards. The railway, which is a 1500-volt electrification of an old steam road between the cities of London and Port Stanley in the province of Ontario, Canada, really constitutes a first step in the extensive general plans of the Ontario Municipal Railways, and the service includes locomotive-hauled freight trains and multiple-unit passenger car trains of both limited and local classes.

The recently completed cars are to be used in motor service at the head ends of the two-car trains. They are 61 ft. 1 $\frac{3}{4}$ in. long over buffers and are exceptionally wide, being 9 ft. 6 in. over posts. This makes possible seats that are 40 in. long, with an aisle 26 in. wide. The car body is divided into baggage, smoking and general passenger compartments, respectively 9 ft., 12 ft. and 25 ft. in approximate length. In the main compartment there are two saloons with metal tile walls and a tile floor set in cement. The seats in the main and smoking compartments are on 34-in. centers, and the total seating capacity is fifty-six.

The bottom framing of the car is made up of structural sills with pressed-steel cross-bridging, plate bolsters with pressed-steel fillers being used. Side posts are alternately of double channels and tees of light section, with angle-iron corner posts. The posts at the bulkheads and partitions are also of channels, with a channel header across between side plates. All of these posts have light wood fillers. The entire outside of the car and the bulkheads are composed of steel plates, the side girder plates and letter boards being of $\frac{1}{8}$ -in. steel and the pier-post panels, etc., being $\frac{3}{32}$ in. thick. The carlines are of pressed steel, and the roof is sheathed with steel plates laid across the full width of the car.

The cars are fitted with extra heavy steel pilots and Tomlinson M. C. B. drawbars. The interior finish is mahogany, inlaid with inside and outside Gothic sash and cathedral glass, and storm sash are fitted to all body windows. The ceiling is of agasote, while the

PORT STANLEY CARS—VIEW AT VESTIBULE END, SHOWING DOOR ARRANGEMENT

PORT STANLEY CARS—VIEW SHOWING SIDE FRAMING AND METHOD OF ATTACHING CARLINES TO DECK SILL

PORT STANLEY CARS—INTERIOR VIEW, SHOWING STYLE OF FINISH IN PASSENGER COMPARTMENT

floor, which is of wood, is covered with linoleum. The car is lighted by semi-indirect system with pendant fixtures, light wiring being in concealed conduit. The heater wiring is also concealed.

There is a vestibule only on the rear end, and this has triple steps covered with Edward's steel trapdoors. Both saloons are very completely equipped with flush hoppers; wash stands with liquid soap holders, towel racks, etc., all toilet-room fixtures being nickelplated. The interior of the car presents an exceptionally tasteful appearance, the mahogany being finished in a rather light tone, and great care has been exercised in selecting soft harmonizing colors both for ceiling and for stained glass.

Nothing in the way of incidental equipment, such as buzzers, air sanders, fire extinguishers, etc., has been

omitted, while a large switch cabinet with a slate back extends from floor to ceiling, this containing all electrical switches. The roof is a compromise arch design having an ogee curve on each side, making a very good lines especially in the hood.

The electrical equipment for each car consists of four General Electric ventilated motors of 125-hp. hourly rating, connected permanently in series groups of two. The insulation, however, is designed for 1500 volts. The control is double end and energy for this is derived from a 1500-600-volt dynamotor which will have a sufficient capacity also to light the motor car and its trailer as well. Pantographs will be used for current collection. Each car will carry a combined straight and automatic air-brake outfit of the variable release type supplied by 1500-volt air compressors.

PORT STANLEY CARS—CAR BODY PRIOR TO INSTALLATION OF ROOF SHEATHING

Choke Coils and Disconnecting Switches

The choke coil, disconnecting switch and fittings illustrated herewith are typical of the new and more complete line of such apparatus recently brought out by the Electric Service Supplies Company, Philadelphia, Pa. The fittings which accompany this line are all of new designs and especially noteworthy.

Both choke coils and disconnecting switches are made for standard and underhung mounting, as well as for

CHOKE COIL—STANDARD MOUNTING

UNDERHUNG DISCONNECTING SWITCH

voltages up to 35,000 and all standard ampere capacities. They are made with a base of channel iron, either 3-in. or 4-in., depending on the size of the coil or switch. Iron pins are riveted into this channel, and insulators cemented to these pins support iron caps, which in turn support the terminal blocks, terminals and coil or switch proper. All channel bases are drilled with 9/16-in. holes in each end and, therefore, may be mounted on any flat supporting member by bolts or lags. These coils and switches are very rugged in construction and possess great electrical and mechanical strength. The switches are designed for disconnecting and controlling

SWITCH LOCK AND PIPE CLAMP

iron pipe clamps for mounting switches or coils on either parallel or transverse piping, disconnecting switch locks for use particularly on underhung types as assurance against any tendency for the blade to be blown open, disconnecting switch stops which prevent the blade from opening beyond a given angle, switch blade operating attachments which provide an extra large hole in the switch blade to facilitate the quick opening of the switch in an emergency, and disconnecting switch hooks in lengths from 4 ft. to 12 ft. for operating the switches from a distance.

A Novel Form of Motor Bus for Interurban Service

There will soon be placed in service between St. Paul and Minneapolis a novel transportation unit that is called a "highway coach" by its builders, the McKeen Motor Car Company, Omaha, Neb. This is stated to be not an omnibus, not a street car and not a jitney bus, but the most comfortable, luxurious, exclusive and up-to-date means of transportation in urban or interurban passenger service. It will compete for the Twin City Rapid Transit Company's intercity traffic at twice the fare charged heretofore, the rate between cities being 20 cents and the local rides costing 10 cents.

The highway coach is equipped with individual chairs

HIGHWAY COACH FOR MINNEAPOLIS

of a new, steel-spiral-spring, pneumatic shock-absorbing cushioned type. This embodies all the cushioning effects of a 2-ft. spiral spring, and it has four air cushions operating in conjunction with it and differentiated on each other, the combination acting both as a cushion and shock absorber. The car is guaranteed by its builders to afford the most easy-riding method of transportation known to man.

Plate-glass, air-tight, round windows afford an almost uninterrupted panoramic view in all directions, the window when open being hinged to the ceiling and giving a full opening of 24½ in. in diameter. Exhaust suction ventilators on the roof maintain constant circulation and removal of the air. The car is electrically lighted, and between each two windows is an electric push button for convenience of passengers in signaling the driver, who controls the two door-operating mechanisms.

Entrance to the car is gained through a two-leaf outward folding door beside the driver's position, the prepayment fare collection being under his supervision. Exit is through double-leaf outward folding door in the side near the rear. Instead of a high step from the mud, the passengers take this car at the curb, the coach entrance being only 15 in. from the ground and the initial step about 7 in. high.

Adequate heating facilities for the car are obtained

high-voltage lines, branch feeders, emergency feeders, etc., as well as for lightning arrester disconnecting switches that are installed to disconnect arresters from the line for the purpose of inspection or repair. The manufacturers claim that these devices are so designed that when they are used in conjunction with Garton-Daniels lightning arresters, a maximum of protection may be expected.

The line of fittings referred to consists of malleable

from the waste products of the gasoline engine, there being twice the necessary heat units available for maintaining the proper temperature of the interior of this car in the coldest of winter days, and with this large supply of waste heat there is no additional expense in providing the passengers with plenty of moderately heated fresh air.

The chassis is a $3\frac{1}{2}$ -ton gasoline truck, having a wheelbase of 216 in. The length of the frame behind driver's seat is 22 ft. The coach may be equipped either with rubber tired wheels for road service or with flanged wheels for use on urban rail lines.

Light-Weight Car for Cleveland & Eastern Traction Company

A car that has just been completed by the G. C. Kuhlman Car Company for the Cleveland & Eastern Traction Company, possesses to an exceptional degree the feature of light weight that has recently become prominent in interurban car design. The railway company's lines extend east from Cleveland to Middlefield, with a branch to Chardon, a town of 1400 population. The land in this region is somewhat hilly, but lends itself to general farming, the principal industry which supports a population of 15,500, and the new car will be operated between the interurban terminal at the Public Square of Cleveland and Chardon, a run of 32 miles. It will make an average number of stops of four per mile, the maximum grade encountered being 11 per cent.

In the design of the car the utmost attention was given to the elimination of all unnecessary weight, and, in view of the fact that no sacrifice of strength or omission of equipment for obtaining the most efficient and safe operation was made, the result is extremely interesting, as is shown in the accompanying table, in which for comparative purposes is included a table of dimensions and weights published in a recent issue of *ELECTRIC RAILWAY JOURNAL*.

STEEL CONSTRUCTION

The underframe is composed of angle side sills with eleven light I-beam crossings between the bolsters; the end sills are made in the form of a trussed frame, with angles at the top and channels at the bottom. Diagonals at each end are arranged to serve as center knees, and are brought well back of the bolster. They are strongly reinforced with angle gussets at the trussed end sills. A powerful construction for the attachment of the drawbars and anchors consists of angles and plates riveted to I-beams extending from the bolster to the end sill. The bolsters are made up of pressed steel diaphragms with 10-in. top and bottom members. At the rear platform the outside knees are omitted to provide an opening for the steps, and the angle forming the roof framing and the angle at the top chord of the side frame extend through to the corner post and aid to support the outer

CLEVELAND & EASTERN CAR—INTERIOR VIEW LOOKING TOWARD FRONT PLATFORM

portion of the platform by means of structural steel connections.

Each side of the car, from the side sill of the underframe to the top plate, is constructed to form a girder.

	Cleve. & East	Fostoria	Union Trac.	Chicago
Over-all length	54 ft. 6 in.	56 ft. 9½ in.	61 ft. 0 in.	48 ft. 0 in.
Over-all width	8 ft. 6 in.	8 ft. 6½ in.	8 ft. 0½ in.	8 ft. 8 3/16 in.
Weight of body	23,186 lb.	29,550 lb.	45,200 lb.	35,600 lb.
Weight of trucks and equipment	36,214 lb.	38,450 lb.	40,400 lb.	34,900 lb.
Total weight	59,400 lb.	68,000 lb.	85,600 lb.	70,500 lb.

of which the principal member is a continuous plate of 3 32-in. steel riveted to the side sill angle, steel belt rail and the posts. The posts are of tee-section, and are alternately single and double, on account of the twin-window arrangement. The top chord of the girder consists of an angle riveted to all post heads. Additional stiffness is imparted to the girder by means of a continuous sash rail at the bottom of the top sash which is dadoed over each side post.

The roof framing consists of an angle on each side, with the horizontal web turned in, and steel carlines riveted to the vertical web. Wooden nailing strips are bolted to the carlines, and canvas nailing strips are bolted to the angle roof sills. After the roof was placed on the carbody, the side angles were riveted to the angle top chord of the side girder.

CLEVELAND & EASTERN CAR—SIDE VIEW SHOWING WINDOW AND DOOR ARRANGEMENT

The front and rear vestibules are framed alike; the sheathing around the front end is of the same thickness as the side plates, while at the rear end it is composed of No. 14 sheet steel. The letterboards are made of sheet steel, and continue in line with the side letter panels.

INTERIOR DETAILS

There is a double flooring, the bottom layer of yellow pine and the top of maple, except at the aisle, where interlocking tiling extends the full length of the carbody proper. The tops of the trap doors over the steps and the floor between the steps and the rear platform are also covered with interlocking tiling, cemented to maple flooring.

The headlinings are composed of sheet steel and installed in a continuous piece from the curtain box molding on one side to the same point on the opposite side, and are the length of two windows, except at the

CLEVELAND & EASTERN CAR—INCLOSURE FOR PACKAGES AND MAIL ON FRONT PLATFORM

center, where they are cut to suit the partition. The only longitudinal moldings are those for the curtain boxes and advertising signs, and for covering the joints of the headlining; the latter are painted the same color as the headlining.

The lower side sashes have brass sash stiles, and are capable of being raised their full height. The upper sashes, as has been already stated, are made in a continuous section and are glazed with pressed prism Gothic glass. An interesting feature of the windows is a novel type of window guard, which is made of strongly framed diamond mesh wire screens. The window guards are attached to the bottom of the lower sashes and slide into pockets in the side walls when the sashes are lowered. When a sash with its screen guard is raised, the lower part of the screen guard covers the pocket opening, and thus prevents rubbish from being forced into the pocket. The inside lining below the windows consists of sheet steel.

The partitions between the motorman's compartment and smoking compartment, and between the smoking compartment and main compartment are of African mahogany. They are glazed in the upper part and have single sliding doors. On the left side of the car, next to the rear platform, is a toilet room with standard ap-

pointments and with a flooring consisting of a single slab of marble.

SEATING ARRANGEMENT

All of the seats are placed transversely, with the exception of the one opposite the toilet room. The type used is a non-reversible, light-weight seat, made without seat rails and having the pedestal and seat back support of pressed steel in one piece. The wall plate is pressed in one piece to form the back support at the wall end. The seats are upholstered in twill-woven rattan, and are of Brill manufacture. The total seating capacity is sixty-three, seventeen seats being located in the smoking compartment which has a transverse seat along the front bulkhead with a folding seat opposite the space at the door to the motorman's compartment. Continuous parcel racks are provided in both compartments, and a package and mail cage is located at the rear of the motorman's platform.

Twelve Brill "Exhaust" ventilators, six on each side of the roof, are installed and these have regulating registers attached to the headlining. The equipment includes hot-water heating system, air brakes, automatic air couplers, fender, sand boxes, trolley retriever, anti-climber bumpers, registers, signal lamps, air whistle, etc., and the car is mounted on Brill 27-MCB-2X trucks, which have a wheel base of 6 ft. 9 in., 34-in. wheels, and are suitable for a speed of 50 m.p.h. They are equipped with four 65-hp. motors per car. The bolster centers are 31 ft. 9 $\frac{1}{8}$ in., and the trucks are arranged to radiate on a curve of 37 ft. 6 in.

The Aeroscope at the Panama-Pacific Exposition

One of the most astonishing of the amusement devices installed at the Panama-Pacific Exposition at San Francisco is one which raises its passengers to an elevation of 330 ft. above sea level and provides a sea horizon of 200 miles. This is called the Strauss Aeroscope and it is reported to be the largest passenger-carrying machine ever built. However, on a smaller scale it would be peculiarly adaptable to ordinary amusement parks.

The device is fundamentally a Strauss trunnion bascule bridge mounted on a revolvable tower. The tower in turn is mounted on a series of eight trucks which travel on a circular railway track 60 ft. in diameter, four of the trucks being provided with 15-hp motors and trains of gears to drive them in either direction. At the apex of the tower, 48 ft. above ground, are mounted two 15-in. shafts, or trunnions, and upon them the huge arm of the structure is mounted. This projects 200 ft. in front of the trunnions and 38 $\frac{1}{2}$ ft. behind them, the rear end carrying a 380-ton counter weight that is made of reinforced concrete. The rear end of the arm is provided with two circular racks which are engaged by pinions driven by two 11-hp motors, and these raise or lower the arm as desired. The arm is provided also with two air propellers mounted near the end. These propellers are driven by a 3-hp motor and they assist in raising the arm and in steadying its motion.

As an amusement device pure and simple, the Aeroscope is unique. The tower and its car are brilliantly illuminated at night and as the lines of the structure are graceful throughout it is particularly inspiring after dark. It moves majestically, each trip consuming ten minutes, and the view afforded from the car is unparalleled. The total capacity per day approximates 6000 passengers, and during the first four weeks of the exposition the Aeroscope carried 65,000 patrons.

The importance of the bascule bridge principle, as applied in the aeroscope, has even been recognized by the United States government which, it is reported, has arranged with the constructors for the application of

AEROSCOPE IN REVOLVABLE POSITION

the principle to military searchlight towers to be erected at the various coast-line fortifications.

Absolute safety for the passenger is guaranteed by the provision of both power and handbrakes under the control of an operator who travels with the car, provision having been made in the design for a wind velocity of 60 m.p.h.

Self-Lubricating Brushes

The "No-Spark" carbon brush manufactured by the Calebaugh Self-Lubricating Carbon Company has been making a remarkably successful record on several electric railways, the principal feature being an ability to run without chipping, splitting, or breaking. This has been demonstrated on the lines of the Lehigh Valley Traction Company where a number of test sets of the brushes have been installed.

Harry Branson, superintendent of equipment of this system, states that a test set of brushes recently removed from a car on the Bethlehem Division had made a mileage of 24,957 and had given excellent results, having been installed in Westinghouse 101-B motors. Other brushes of the same type are in service on Westinghouse 303 and 38-B motors, used elsewhere on the system, but these have not yet been removed because their condition is good. The commutators are all in excellent shape.

The makers claim that the "No-Spark" brush makes a frictionless contact because of its self-lubricating qualities and that it reduces the commutator wear 90 per cent, giving a dark-brown gloss on the commutator surface in a very short time after application. It will, in consequence, carry some 50 per cent more load than that normally allowed per brush and is moisture-proof as well as fracture-proof. Naturally, the sparking is reduced to the absolute minimum.

New Type of Steel Pole

A novelty in poles recently brought out by the Carbo Steel Post Company, Chicago, makes use of the revolutionary but logical principle that pole legs should be anchored under ground (thus putting the legs in straight tension or compression when a transverse force is applied) instead of being set in concrete to form a cantilever with the bending stresses localized at the ground line.

The makers believe that rigidity in a direction parallel to the wires on a pole line is undesirable, because if a wire should break the load is concentrated on the two poles at the break. If flexibility is provided the poles bend until the unbalanced force exerted by the wires is transmitted back from the break to a large number of the other poles, thus preventing actual failure of any pole. In consequence both the transmission line poles and the trolley poles designed by the company are of a modified A-frame type with the long dimension transverse with the line.

The poles are buried about 4 ft. or more in the ground, and each leg is provided with anchor plates to hold the feet of the pole firmly in place through the weight of earth resting on them. At the ground line is a sway plate that extends between the legs, giving a certain amount of longitudinal resistance to pull. Rusting at or below the ground line is prevented by a special finish which is stated to be proof against moisture and alkaline soils.

The material used in the construction of the poles is a high-carbon steel of uniform texture with an elastic limit over 50,000 lb., thus providing the desired lightness. It is stated that this metal will not pit even if left unpainted, and on this account the life is long in comparison to the ten or twelve years' use to be expected from wooden poles. The first cost, pole for pole, is reported to be about the same for wooden poles and for the new design, but owing to the superior strength of the latter only about half as many poles per mile are required. The total cost of a light transmission line with the new poles is estimated to be about three-fourths of the cost involved when wooden poles are used.

ANCHORED POLE

Effects of Heat Treatment on Nickel and Manganese Steel

In a paper presented before the American Society of Mechanical Engineers at Buffalo recently, Robert R. Abbott stated that for a heat-treated 1½ per cent plain manganese steel, the manganese in excess of that contained in a nickel-manganese steel of a corresponding carbon content (about 0.34 per cent) exerts a strengthening effect equivalent to that of about three times the same amount of nickel. While the effect of manganese on a steel which has not been heat-treated is to increase the toughness slightly, its effect upon a heat-treated steel is decidedly the reverse. In the case of nickel the effect upon an untreated steel is practically zero, while in a heat-treated steel nickel increases the toughness decidedly. An untreated steel containing about 1½ per cent of manganese is fully as tough and is stronger than a nickel steel of about 3¼ per cent nickel.

LONDON LETTER

Women Fast Taking the Places in Tramway Service of Men Needed at the Front

(From Our Regular Correspondent)

Fifty additional women have started training as car conductors in the service of the Glasgow Corporation Tramways Department, bringing the total number of their sex on active duty or in training to 250. The places of so many men have to be filled that it is expected the number of women appointed will soon reach 500. The list of women applicants now contains about 1400 names.

The traffic receipts on the Glasgow Tramways during the last financial year amounted to £1,070,353, being £8,083 less than in the preceding year. The count of the actual number of passengers carried during the year has not yet been completed, but up till May 29, which leaves only two days short in the year, the figures were 334,584,216, as compared with 334,676,627 in the corresponding period of the preceding year. Taking into account the exception of these two days' statistics and the circumstances of the war during the past ten months, the total number of passengers carried during the year which began on June 1, 1914, compares very favorably with the preceding year's total of 336,654,624.

The Coventry City Council has decided to employ a dozen women conductors. The women are to be between thirty and forty years of age, to work forty-eight hours a week, receive 6½d. an hour wages and wear uniforms.

The trolley scheme of the Hove Town Council has been abandoned until after the war. The project has been a source of controversy from its inception in 1911. After a bitter Parliamentary campaign in 1912 the plan received legislative sanction in such a form that both Hove and Brighton were left to pursue their own course, and complications ensued, from which the only escape seemed to be a costly arbitration. Brighton, in fact, was about to apply for the appointment of an arbitrator when the war prevented further proceedings.

The Corporation of Birmingham has decided to increase all the tramcar fares in the aggregate 10 per cent. Assuming that the volume of traffic remains constant, this will result in a gain in the takings of £60,000 per annum. The present rates were fixed in February, 1912, and the proposed alterations will in the main be a reversion to those in operation prior to that date. At present the average penny fare carries a passenger 2 miles 600 yards. When the new scale comes into operation the distance for the same money will be reduced to 1 mile 1200 yards. Outside this radius there will be an increase of a halfpenny on the present rates. As regards workmen's fares, they will go up ½d. on each return ticket. Though passengers in the penny zone will find all the distances curtailed, an increase in the number of overlapping stages will help slightly to improve matters.

At a meeting of the tramways committee of the Newcastle Corporation the general manager reported that since the last meeting of the committee forty-eight women conductors had been trained; that twenty-four were in full charge of cars on the Osborne Road route, and that the rest were in training on the Jesmond route. The general manager expressed his appreciation of the help given by the public to the women conductors, as well as of the services of the inspectors and motormen. Application for further women conductors are desired. The committee has decided to abolish halfpenny workmen's fares, the minimum in future to be 1d.

The Edinburgh & District Tramway is employing on its cars twenty women conductors, who received preliminary training at the depot. The manager has expressed himself as highly satisfied with the manner in which they are performing their duties. The employment of women conductors in Edinburgh, however, is opposed by the tramwaymen. The management has agreed that their employment shall not exceed the period of the war; that efforts will be made by the company to obtain male labor, and that old employees discharged from military service will be replaced in their positions. An amicable settlement has therefore been arrived at, and it is likely that Edinburgh will have many women on the tramways in the very near future.

The Manchester Ratepayers' Association has addressed a letter to the treasury urging it to refuse sanction at present to the carrying out of the Manchester electricity scheme for new works at Barton. It is pointed out that the great amount of skilled labor required for the construction and manning of the new works would cause a serious drain upon the already weakened labor market and tend to draw men away from work immediately necessary for the prosecution of the war, and that there is not likely to be any overwhelming pressure upon the Manchester electricity department for some time.

Owing to the fact that 2000 tramwaymen in Manchester have enlisted, the Manchester Corporation is considering the advisability of engaging women conductors to fill some of the places.

The Salford Corporation tramway workers have accepted the terms offered by the borough tramway committee of a war bonus similar to that recently awarded by arbitration at Newcastle-on-Tyne. The terms are a bonus of 2s. 6d. a week for married men and householders, 1s. 6d. a week for single men, and 1s. a week for youths under the age of eighteen years. The question of the employment of women conductors was discussed at a recent meeting of the men, and a resolution was proposed asking the management to withdraw the women and offering the support of the Salford branch of the men's union and of the Trades and Labor Council in finding suitable male labor for the cars. If these efforts are not successful, however, the resolution provides that the men shall work with the women on certain conditions. The women conductors, of whom sixteen have been trained, are to work on cars running from Weaste to the Cliff and from Irlams-o'-th'-Height to the Market Place, Broughton.

The strike on the London County Council Tramways has now definitely collapsed though it seemed that it would be renewed when the tramways manager's decision to reinstate only men over military age became known. The Council has taken a very firm position as regards this, all men of military age being refused, unless they can show special reasons for exemption from the rule. Mr. Fell has stated that every effort will be made to deal sympathetically with the cases of the men of military age who have good reasons for not enlisting. During the week ended May 12—that before the strike began—the total traffic receipts were £50,891, as compared with £42,779 for the corresponding week in 1914, but for the following three weeks the figures were only £22,460, as against £44,961; £12,610, as against £44,961; and £23,586, as compared with £47,346. No official notification has yet been received from the men's joint strike committee or their unions that the strike is at an end. While before the dispute great difficulty was experienced in maintaining full service, it is estimated that at least 90 per cent of the normal number of cars are now in operation.

Reporting upon recent proceedings before the House of Commons committee regarding new tramway schemes, the London County Council mentions the important fact that, in connection with the proposal for extending the Farringdon Road tramways, the chairman of the select committee declared that the committee would very much like to see a scheme to carry the tramways through to South London. So keen, however, was the opposition to many of the schemes that Parliamentary sanction has been granted only in the case of the less important ones—those involving little change and small expense.

Adverse comments were made at a recent meeting of the Birmingham watch committee on the action of tramway conductors who refused to work with a number of women and sent the authorities an ultimatum that if the women were not withdrawn there would be a strike. The committee has been reluctantly compelled to accede to the demand, because the cars are carrying so many munition workers that it cannot run the risk of having them stopped.

The Portsmouth Town Council has decided to engage women conductors to take the place of men who have joined the forces. Of 330 motormen and conductors in the corporation service 137 have enlisted and thirty entered other government service. The women conductors will be paid 5d. an hour, and will be supplied with a uniform.

News of Electric Railways

THE CHICAGO ARBITRATION

Proceedings Begun on June 28 With the Presentation of Case of the Men

Arbitration of the differences between the Chicago surface and elevated railway companies and their employees was begun on June 28, with Mayor Thompson as umpire, State's Attorney Maclay Hoyne, arbitrator for the employees, and James M. Sheean, representing the railway companies. Eight questions are to be arbitrated and each side has the right to present evidence through counsel. The following are the questions:

1. Percentage of straight runs and consecutive hours in which swing runs shall be completed.
2. Maximum time covered by straight runs on Sundays.
3. Allowances for fall-backs for meals and reliefs, if any, on the streets for meals.
4. Hours of service, including weekdays, Sundays and holidays for employees other than trainmen provided for in this agreement.
5. Number of years to receive maximum wage scale and wages for all trainmen, including trainmen on cinder, sprinkler, supply and other cars.
6. Hours of service and wages paid car repairers, motor repairers, inspectors, dopers, car placers, car cleaners, janitors, terminal men, or other men around carhouses.
7. Allowance for turning-in time.
8. Seniority and efficiency with men outside of train service.
9. Night car hours and wages.
10. With reference to employees outside of the train service the company recognizes seniority of service, but in connection therewith efficiency shall be taken into consideration.

William Quinlan, president of the local union, was the first witness. He gave evidence regarding the methods of employing men in the early days and at the present time, and also outlined the existing working conditions and what he believed should be done to improve them. He claimed that the large and heavier cars, refinements in their equipment and increased vehicular congestion made the work of the motorman increasingly more difficult. Regarding the idle time of extra men between swings, Mr. Quinlan claimed that the men could not engage in other business without obtaining a permit from the company. He said that the present allowance of five minutes for turning-in time should be increased to ten minutes. According to Mr. Quinlan it at one time required only one month to reach the maximum wage scale, whereas it now required six years. This was brought about by the union conceding increased time to reach the maximum whenever a new wage agreement was negotiated.

Mr. Quinlan claimed that the graded scale had discouraged the men and offered an opportunity for abuse, but stated specifically that the present management of the companies had not taken advantage of this. No more accidents were charged against the new men than the old when working conditions were taken into consideration. The fact that the hours of the new men were longer and their runs undesirable as compared with those of the old men accounted largely for the increased number of accidents recorded against them. It was Mr. Quinlan's opinion that a man is as proficient a conductor or a motorman at the end of one year as he ever will be. Questioned regarding wages and working conditions of the employees outside of the train service, Mr. Quinlan said they were paid less than ordinary building laborers while they performed duties requiring much more skill. He also contended that the duties of motormen on sprinklers, cinder, supply and other utility cars were identical with those of the motormen on passenger cars, and he said that the men on these runs should be included in the regular train service.

George W. Miller, attorney for the railway companies, in cross-examination of Mr. Quinlan, brought out that present working conditions were much better than those of the past. He also showed how improvements in car equipment and design had aided in reducing accidents and in decreasing the

responsibilities of both motormen and conductors. Prior to 1912 eighteen different transfers were used by the surface lines, whereas only four have been in use since 1912. Regarding swing and split runs, Attorney Miller in his examination of Mr. Quinlan, emphasized the importance of furnishing a service to meet the riding habits of the public and by bringing out that the speed varied with the conditions on the street he refuted the argument regarding the alleged increase in speed. Although Mr. Quinlan claimed the speed had increased he did not know it to be a fact. Mr. Quinlan also acknowledged that long service with the company tended to increase the feeling of responsibility and interest and that high wages added to this increase. Concerning the rotating and standing list of extra men, he claimed that the company preferred the former and the men preferred the latter or standing list. This completed Mr. Quinlan's testimony.

On Tuesday morning, June 29, John Ernst, a cabinet-maker, was examined. Inquiry showed that he was getting 33 cents an hour for steady work, but he believed that he was not being paid enough. On cross-examination it was brought out that he based his idea of the wage he should receive upon that received by workers in other shops. M. C. Boyle, a conductor, was examined next. He had been in the service for twenty-seven years and was receiving the maximum wage of 32 cents an hour. This was insufficient. When he entered the service he had \$1,000 in the bank. Of this only about \$600 was left. He had used about \$125 to make up his deficiency in living expenses. He was also examined regarding the transfer system, trip sheets and car loadings.

James M. Sheean, the arbiter selected by the Chicago surface and elevated railways, served as attorney for the Western Railroads in the arbitration of wages and working conditions for the locomotive engineers and firemen. Mr. Sheean was born in November, 1866, at Galena, Ill., was graduated at Beloit College in 1887 and studied law under his father. He was admitted to the bar in 1889, in which year he was taken into partnership with his father and uncle. He moved to Chicago in 1901 and for three years was with the firm of Pan, Calhoun & Glennon. In 1904 the law firm of Calhoun, Lyford & Sheean was organized, and as a member of this firm Mr. Sheean is serving as arbiter for the railway companies. For a number of years he has served as a trial attorney for steam railroads.

Maclay Hoyne, the arbitrator selected by the employees, is State's attorney of Cook County. He was born in Chicago in October, 1872, and was graduated from Williams College in 1895 and Northwestern Law School in 1897. In July, 1913, Mr. Hoyne was appointed assistant corporation counsel of Chicago and two years later was made first assistant corporation counsel. He resigned from this office in June, 1907, to engage in private practice and four years later again was appointed first assistant corporation counsel. In this capacity he served as counsel for the Subway & Harbor Commission and was in immediate charge of the litigation between Chicago and the Peoples Gas, Light & Coke Company regarding gas rates. Mr. Hoyne is also credited with drafting the Chicago 70-cent gas ordinance, upon which issue former Mayor Harrison was elected to his last term of office. Mr. Hoyne was elected State's attorney of Cook County in November, 1912, on the Democratic ticket.

SPRINGFIELD-WORCESTER LABOR AGREEMENT

A new working agreement has been signed by officials of the New England Investment & Security Company and by representatives of the employees' unions on the Springfield (Mass.) Street Railway and the Worcester (Mass.) Consolidated Street Railway to continue in effect from May 31, 1915, to May 31, 1916, taking the place of a three-year agreement which expired on the former date. According to advance reports no increase will be granted the employees of the Springfield company, but there will be an increase on the Worcester lines to a maximum scale of 31 cents an hour, the minimum being 25 cents. The day rate at Springfield will range from \$2.30 to \$2.85. The agreement practically equalizes the wages on the system under the "nine-hour-in-eleven" law. The full agreement will be made public after ratification by the local unions.

CHICAGO LINES ISSUE STATEMENT

Questions Involved in the Recent Strike Explained by the Companies

On June 18 the Chicago (Ill.) Surface Lines carried in the daily newspapers an advertisement explaining the issues in the controversy that resulted in the suspension of railway service in that city for two days. Its termination was referred to as a victory for arbitration. The statement was concerned with correlated subjects of arbitration, labor and capital and dealt with all three features. The company said in part:

"The question settled in this crisis was not one of wages, hours or other conditions of employment, and was not, we repeat, a question as to whether Chicago should have a strike lasting two days or two months; but the much more fundamental question as to whether men in a twentieth century democracy should settle their differences in accordance with twentieth century ideals and standards, or by recourse to the methods of primitive man and feudal government. The issue was rather as to whether civic progress could be set back, even temporarily, by any group of men, either capitalists or working men, in the second largest city of the most progressive democracy in the world. The result was a victory for the principle that civilized men either should settle their differences face to face and man to man or should leave those differences to an impartial body of their fellow men.

"There was a time when large employers were inclined to reject arbitration and when public service corporations were operated by men who looked upon them as purely private corporations, but that time has passed. There is something to be said, if not in justification, at least in explanation, of the old type of railway builder and corporation operator. Trained in the individualistic school of his time, he believed that he was entitled to the fruits of his labor, and he resented interference with what he considered his private business. His time has passed and a new type of man has taken his place. But the fight which oftentimes is made upon his successors is based upon the belief that the old type still exists.

"The worst that can be said of the type that has passed is that these men held the point of view of their time. Their time has passed never to return; the public has a new point of view and the management of great properties to-day is vested in men whose point of view has changed with the times. All that the men in charge of public corporations ask to-day is that the public realize the change that has come in the ownership and management of such properties; that the men in charge of them are endeavoring—and are succeeding up to the limit of their capacity as men—to put into their business a spirit and practice in accordance with the newer ideals and standards of to-day. They expect no special consideration from the public; they want only fairness, and expect to give it.

"There have been signs in recent controversies between labor and capital that labor itself, after having long ago won capital to the principle of arbitration, was beginning to question, and possibly would reject altogether, this great principle, because it had not at all times resulted favorably, or perhaps even fairly, to the workers.

"As we have stated heretofore, we believe that the principle of arbitration frequently has been misused and misunderstood; but we do not believe that these errors should be charged to the principle itself; nor do we believe that, on account of such errors, the enormous victory of labor in first establishing the principle of arbitration as a means of settling disputes should be lost or forgotten.

"If it be admitted that the older and outworn methods of capital constituted a tyranny, it must be admitted also that a resort to force on the part of labor in these enlightened times would constitute no less a tyranny, not only over the interests of the employer, but over the public interest as well. It is obvious that there can be no gain in the substitution of one tyranny for another, and that the efforts of labor men and employers alike should be directed toward the elimination of all tyranny and the substitution of sound principle, safeguarded by honest men, as we believe the great principle of arbitration has been safeguarded in the agreement under which the present differences are to be adjusted."

CLEVELAND'S FREIGHT TERMINAL

The special committee of the City Council, to which was referred the proposed franchise of the Cleveland & Youngstown Railroad for a freight terminal in Cleveland, was to meet on July 2 to hear arguments on the disputed points between the company and the city. Electrification of the freight yards and the streets to be vacated in the Broadway-Orange Street district are the principal points in contention.

Attorney S. V. McMahon informed the committee on June 24 that the Broadway Improvement Association had employed an engineer to make plans for subways under the proposed terminals at East Twenty-third Street and Pittsburgh Avenue. The company's engineers declared that such plans would be impractical and Mayor Baker expressed the opinion that neither grade crossings nor subways would answer the purpose. He suggested that the city reserve the right to require the construction of overhead bridges. Director of Public Service Sidlo is preparing a report on the proposition. He will probably recommend electrification of the terminals.

THE NEW YORK PUBLIC SERVICE INVESTIGATION

The Thompson committee appointed by the last New York Legislature to inquire into the workings of the New York Public Service Commissions will resume its hearing in New York City on July 15. The new chairman of the committee is Merton S. Lewis, first deputy attorney general. He succeeds Col. William Hayward, now a member of the Public Service Commission for the First District. It will be recalled that Governor Whitman failed to agree with the report of the majority of the committee with respect to the commission for the First District and that he appointed Mr. Hayward to succeed Mr. Maltbie, whose term of office had expired, and vindicated the commissioners. The investigating committee will now concern itself with the public service commission law and with the rapid transit contract in Greater New York and will report its findings to the next Legislature.

ARBITRATION LIKELY AT ALBANY

On the afternoon of June 29 Harry C. Weatherwax, vice-president of the Delaware & Hudson Company, controlling the United Traction Company, Albany, N. Y., and Charles F. Hewitt, general manager of the United Traction Company, agreed to take up again on July 1 the consideration of the questions at issue between the traction company and its employees. The principal question involved is in regard to jurisdiction over all the lines of the United Traction Company by the Amalgamated Association, which objects to the operation into Albany of cars of the Hudson Valley Railway manned by members of the Brotherhood of Locomotive Engineers.

The United Traction Company has issued a statement reviewing this question. The contract between the Hudson Valley Railway and the United Traction Company, both controlled by the same interests, for the operation of through cars from points on the Hudson Valley Railway into Troy, via Waterford, was entered into on June 7, 1901. Under the terms of this agreement the Hudson Valley Railway furnished at its own expense the men to run its cars over the tracks of the United Traction Company. The Amalgamated Association contends that its contract covers this run and that the cars operated into Troy by the Hudson Valley Railway should be manned by members of the Troy division of the Amalgamated Association.

For the first ten years of the contract between the companies the men operating the cars of the Hudson Valley Railway into Troy over the lines of the United Traction Company belonged to the Amalgamated Association. Subsequently they seceded and joined the Brotherhood of Locomotive Engineers and the Order of Railway Conductors. In its statement the United Traction Company says that as far as it is concerned it feels that these organizations should settle the matter between themselves and should not involve the company or the public. While both the United Traction Company and the Hudson Valley Railway feel that they cannot undertake to settle the differences between the two organizations, they are willing, if it is desirable, to be a party to arbitration proceedings.

INFORMAL TOLEDO CONFERENCE

Henry L. Doherty, chairman of the board of the Toledo Railways & Light Company, Toledo, Ohio, met with a few members of the franchise committee of the Toledo City Council on the afternoon of June 29 and discussed informally a number of points in the new draft for a franchise made by that committee. President Frank Coates and Attorneys Tracy and Rathbun Fuller of the company also were present.

Mr. Doherty and Attorneys Thomas H. Tracy and Rathbun Fuller told the franchise committee that they must refuse to accept the clause in the tentative franchise which provides that the company recognize the initiated municipal ownership ordinance as legal. Mr. Tracy suggested that a clause be inserted saying that the franchise under consideration shall not affect or be affected by the municipal ownership ordinance. Mr. Doherty objected to the clause in the proposed franchise which would require the company, in case the city purchased the property, to accept at least half the bonds issued against the property for the purchase. The bonds would be a lien against the property only and not against the tax duplicate. Mr. Doherty said the company preferred a cash settlement. The committee was informed that the company would insist on a rate of fare that would yield 6 per cent on the investment; a guarantee that it would be reimbursed for any loss during the year's try-out of the 3-cent fare; assurance that the property will be purchased at its appraised value if a franchise is granted any other company, and that it should not be required to begin again if the try-out period is interrupted.

At the conference on June 30 agreements were reached on a number of points, but several others were still in dispute at the close. One of these pertains to the return on the investment during the try-out period, and another is the proportion of bonds the company shall take in case the city purchases the property. Mr. Doherty wanted a stipulation that the company accept one-third of the bonds at a fair market value. Chairman Dotson insisted that they should be taken at par and accrued interest.

Mr. Doherty expressed surprise when informed of the Mayor's assertion some time ago that he would veto any franchise agreement reached by the committee and the company representatives, but Chairman Dotson expressed the belief that Council will approve the franchise under consideration. It was agreed between the parties that the franchise should be submitted to a vote of the people at the primary election on Sept. 14, instead of the regular November election. Mr. Doherty asked the committee to have the tentative draft of the franchise printed, leaving blanks for the portions upon which an agreement has not been reached, and that another conference be held the afternoon of July 2. He desired to reach an agreement on the entire franchise, if possible, before he returned to New York on July 3.

CONTROVERSY IN TORONTO

Toronto Railway and City in Contest for Short Line Desired by the City for Its Civic Railway

At noon on June 29 the Board of Control of Toronto, Ontario, issued instructions to Works Commissioner Harris to tear up the remainder of the tracks of the Toronto & York Radial Railway's Metropolitan division on Yonge Street south of Farnham Avenue, and this has been done. Shortly after the order was issued by the controllers the Toronto Railway opened the legal battle over the franchise question at Osgoode Hall. The company through its solicitors issued a writ against the city "for an injunction to prevent the defendants, the Corporation of the city of Toronto, from removing the tracks on 1320 ft. of Yonge Street south of Farnham Avenue, and for a mandatory order to replace so much of the said tracks as have already been taken up." This injunction is pending.

At the Board of Control meeting Controller Spence opposed the action of the board on the ground that it might prejudice the city's interests before the Ontario Railway Board, when the members consider the railway application for an order to operate. Mayor Church claimed that the alleged sale of tracks by the Metropolitan to the Toronto Railway was not carried out according to the requirements of the railway act.

Mayor Church issued a statement in which he said:

"The franchise has elapsed, and no one can renew it but the people. The sale of the Metropolitan to the Toronto Railway means nothing, as the Metropolitan had nothing to sell after midnight last Friday except the rails and overhead fixtures. The district south of Farnham Avenue to the Canadian Pacific Railway crossing is the most important in Toronto and is the funnel for Sir Adam Beck's radial railways. The 1891 agreement of the Toronto Railway does not give it the right to operate this service, as the Beck act is to be read into the section requiring the vote of the people. The subway at the head of Yonge Street will not be finished for some time. Before the Toronto Railway can operate, it will have to secure an order from the Dominion Railway Board."

The Mayor proposes that the city lay a permanent pavement on the street and a double line of tracks and find a way to link up with the St. Clair Avenue line of the Toronto Civic Railway operated by the city.

The Toronto Railway's answer to the action of the city officials in tearing up the tracks was heard by the Ontario Railway Board on June 29. H. S. Osler, counsel for the company, appealed to the board for an order compelling the city to relay the tracks and affirming the right of the company to give a service over that section. Mr. Osler declared that the work of tearing up the tracks had been continued in contempt of the board after the company had appealed to the board. He held that under its agreement with the city the Toronto Railway had the right to operate upon all streets with the exception of the portion of Yonge Street where the York Radial Railway had a franchise. When the radial company no longer had that right it fell to the Toronto Railway. A remark by the chairman of the railway board that the line was better than nothing and that the city had apparently treated with indifference the efforts of the company to accommodate the public brought a vigorous objection from Mr. Fairty for the city. In reserving judgment Mr. McIntyre of the Railway Board expressed the opinion that some interim arrangements should be made for the convenience of the public.

Amalgamated to Meet in Rochester.—The fourteenth convention of the Amalgamated Association of Street & Electric Railway Employees of America will be held in Rochester, N. Y., in September. The *Boston News Bureau* says that a concerted effort may be made by New England car men at the meeting to have the arbitration clause stricken from their constitution as a result of the Bay State Street Railway arbitration award.

New Stone & Webster Offices in Texas.—A suite of offices in the Scanlan Building at Houston, Tex., has been engaged for the district office of the Stone & Webster Management Association. L. C. Bradley, assistant district manager of the association, will occupy the new quarters with his office force on July 10. Mr. Bradley formerly had supervision over the Dallas properties controlled by Stone & Webster, which work has now been assumed by Charles F. Wallace.

Commissions as Constitutional Bodies.—Representatives of many public utility corporations which are under the jurisdiction of the Public Service Commissions of New York State joined on June 23 in urging a Constitutional Convention committee to make the commissions constitutional bodies. At present they have only legislative authority for their existence. It was urged that the change would add dignity to the commissions, tend to take them out of politics and add force and weight to their rulings.

The Philadelphia Transit Ordinance.—By unanimous vote the Common Council of Philadelphia, Pa., has passed the ordinance authorizing the \$6,000,000 transit loan. The finance committee's plan is to have the loan ordinance transmitted to the Mayor as soon as it is concurred in by Select Council. Immediately upon being advised that the ordinance has been approved by Mayor Blankenburg, the finance committee will report the appropriation ordinance, which will be passed by both chambers. The committee proposes to allot \$3,000,000 for preliminary work on the Broad Street subway and \$3,000,000 to the Frankford Elevated line.

Financial and Corporate

ANNUAL REPORT

Middle West Utilities Company

The comparative statement of income, profit and loss of the Middle West Utilities Company, Chicago, Ill., for the fiscal years ended April 30, 1914 and 1915, follows:

	1915.	1914.
Total income	\$1,528,855	\$1,466,760
Expenditures	168,855	165,068
Balance	\$1,360,000	\$1,301,702
Interest	378,684	227,516
Net income	\$981,316	\$1,074,186
Preferred stock dividend	598,048	566,925
Balance	\$383,268	\$507,261
Written off	80,000	75,000
Balance	\$303,268	\$432,261
Due from subsidiary companies	78,504	147,416
Total surplus	\$381,772	\$579,677

The report shows total income of \$1,528,855, comparing with \$1,466,760 in the previous year, an increase of \$62,095. Interest charges were increased \$151,168 and preferred stock dividends were increased \$31,123, but in spite of this the company surplus for the year, after all deductions, stood at \$303,268.

The report states that owing to the unsettled conditions the increase in gross business of the subsidiary operating companies was not equal to what might have been expected under normal conditions. The combined earnings of the subsidiary companies for the last two fiscal years follow:

	1915.	1914.
Gross earnings	\$7,634,745	\$7,345,350
Operating expenses	4,877,016	5,036,696
Net	\$2,757,729	\$2,308,654
Fixed charges (paid outside holders) ..	\$1,307,629	\$908,032
Dividends (paid outside holders)	310,428	474,816
Total	\$1,618,057	\$1,382,848
Earnings accruing to Middle West Utilities Company	\$1,139,672	\$925,806

Of the foregoing earnings \$437,123 come into the company's treasury as interest on bonds and debentures, \$269,774 as interest and brokerage on money advanced and \$354,270 as dividends on stocks, leaving a balance of \$78,504. This is the company's proportion of the surplus carried in the aggregate surplus accounts of the subsidiary companies on their own books.

THE KANSAS CITY REORGANIZATION

At the meeting of the committee of the upper house of the City Council of Kansas City, Mo., to which the ordinance extending the time limit for the acceptance of the street railway franchise was referred, Frank Hagerman, attorney for the receivers of the Metropolitan Street Railway, outlined the history of the negotiations under the terms of the franchise. He suggested that the only hope for agreement lay in the proposal of Judge Hook of the Federal Court to present a plan of reorganization for the adoption of the stockholders and bondholders. Mr. Hagerman had no idea what would happen if the franchise was returned.

The participation of the city in the management of the street railways under the new franchise was indicated at the session by the questions and remarks of Aldermen. Under the court's sanction the receivers have employed P. J. Kealy, suggested by the street railway interests, and Robert P. Woods, suggested by the city, to perform practically the duties which will be performed by the board of control provided for in the new franchise. In response to questions by Aldermen, it was pointed out that these gentlemen are actually performing such duties, especially in reference to schedules and service. Judge Evans urged that since Judge Hood had so plainly indicated his conviction that service to the public was the first consideration of any settlement, the Council should accede to his request for an extension of four months in the time limit for acceptance of the franchise.

The City Council of Kansas City has granted an extension to Nov. 7, four months, to the time within which the Kan-

sas City Railways must accept the franchise voted by the city. The action was in response to a request of Judge Hook of the federal court, who said he would prepare a plan for the acceptance or rejection of the interested parties, and would recommend final cancellation of the franchise if this plan was not adopted. The Council has also extended to Nov. 20 the opportunity for the interurbans to accept the conditions of the franchise bearing on a union station.

WASHINGTON MERGER STORY DENIED

In a letter to the ELECTRIC RAILWAY JOURNAL George E. Hamilton, president of the Capital Traction Company, Washington, D. C., asks that a denial be published of the item which appeared in the issue of this paper for June 26, page 1223, to the effect that negotiations were being conducted for the merger of that company with the Washington Railway & Electric Company. Mr. Hamilton says:

"Permit me to state that the Capital Traction Company, its officers and directors, have no knowledge whatever of any such negotiations and that the article referred to is entirely without foundation in fact."

OAKLAND, ANTIOCH & EASTERN FINANCING

The Oakland, Antioch & Eastern Railway, Oakland, Cal., has asked the Railroad Commission of California to approve its new plan of financing. This plan embraces two agreements, one with the bondholders and the other with the stockholders of the company. The agreement between the Oakland, Antioch & Eastern Railway and the bondholders of the Oakland & Antioch Railway and the San Ramon Valley Railway was originally executed on Nov. 19, 1914, and was amended on Jan. 1, 1915. The agreement provides that the bondholders shall deposit with the Union Trust Company, San Francisco, those coupons which will mature in the years 1915, 1916 and 1917. As security for these it is provided that the Oakland, Antioch & Eastern Railway shall deposit with the trustee prior to Jan. 1, 1918, first mortgage bonds in an amount which, at 80 per cent of their face value, will equal the par value of the coupons deposited and unpaid on Jan. 1, 1918. A further provision is made that the Oakland, Antioch & Eastern Railway shall cancel the unsold portion of the note issue authorized by the Railroad Commission on Feb. 3, 1914. The stockholders' agreement, dated Nov. 19, 1914, provides that each subscriber thereto shall pay to the trustee, as a loan to the railway company, the sum of \$3 on each share of stock held by him. These payments are to be made according to the following schedule: Jan. 1, 1915, \$1 per share; July 1, 1915, \$1 per share; Jan. 1, 1916, 50 cents per share, and July 1, 1916, 50 cents per share. As security for those advances the railway agrees to deposit with the trustee its promissory notes in equal amount. These notes are to be secured by first mortgage bonds in the ratio of two to one.

RECEIVERSHIP AVOIDED

By the payment of a portion of two judgments at once and agreeing to pay the remainder on Dec. 24, 1915, the Cincinnati, Dayton & Toledo Traction Company prevented the appointment of a receiver to collect its rental, in the Federal District Court at Cincinnati on June 24. Edna Wilson et al, executors and trustees of George B. Wilson, deceased, and Julius C. Levi and Samuel Leopold, executors of Marks Leopold, Philadelphia, each secured judgment in the Federal Court on Dec. 24, 1914, for \$5,479.17, representing the principle and interest on five debenture bonds of the Dayton Traction Company, a subsidiary of the defendant company.

Both plaintiffs had asked for a receiver for the rents, and a temporary restraining order had been issued to prevent either the Ohio Electric Railway, which operates the property under lease, or the Cincinnati, Dayton & Toledo Traction Company from disposing of the property or money belonging to the defendant, except on order of the court, and the hearing was set for June 24. Attorneys, however, informed the court that a settlement had been arranged and asked for a continuance. This was granted. The company is to pay \$3,125 on each claim at once and the remainder on Dec. 24, when it receives an installment of rental from the Ohio Electric Railway.

Birmingham Railway, Light & Power Company, Birmingham, Ala.—The July dividends will not be paid on the common and preferred stocks of the Birmingham Railway, Light & Power Company. This decision was reached on account of the general business depression. An initial dividend of 3 per cent was paid on the preferred stock in January, 1902, and 3 per cent has been paid since then to and including December, 1914. In 1903, 3 per cent was paid on the common stock; in 1904 and 1905, 4 per cent; in 1906, 5 per cent; in 1907 and 1908; none; in 1909, 2 per cent; in 1910, 5 per cent; in 1911, 7 per cent; in 1912, 8 per cent, and in 1913 and 1914, 6 per cent.

Chicago (Ill.) Elevated Railways.—The investigation conducted by the Illinois Public Utilities Commission on the complaint of J. B. Hogarth against the Chicago Elevated Railways collateral trust has resulted in the dismissal of the case. The commission found that the collateral trust, against which the complaint was filed, was not a public utility, and that therefore the commission had no jurisdiction in the case. The answer of the company to the alleged violation of the utilities act by the trust was referred to in the *ELECTRIC RAILWAY JOURNAL* of March 20, page 599.

Cleveland, Painesville & Eastern Railroad, Willoughby, Ohio.—The Public Utilities Commission of Ohio has authorized the Cleveland, Painesville & Eastern Railroad to issue \$20,000 of its 5 per cent bonds, to be disposed of at not less than 80, the proceeds to be used to reimburse the income for improvements paid out of the earnings in 1914. The Cleveland, Painesville & Ashtabula Railroad has been authorized to issue \$10,000 of bonds on the same basis and for a similar purpose. The latter company is owned by the former.

Empire United Railways, Syracuse, N. Y.—The Public Service Commission for the Second District has authorized the issue of \$42,400 of car trust certificates by the Empire United Railways to pay in part for twelve new pay-as-you-enter cars to cost \$52,980, the company paying \$10,580 in cash. The certificates are placed with the Guaranty Trust Company, New York, N. Y., bear interest at 6 per cent, and mature in three yearly installments from 1916 to 1919.

Kanawha Traction & Electric Company, Parkersburg, W. Va.—The Fidelity Trust Company, Baltimore, Md., as trustee is offering at 98½ and interest, to yield about 6 per cent, the unsold portion of the authorized issue of \$1,100,000 of two-year 5 per cent mortgage gold notes of the Kanawha Traction & Electric Company referred to in the *ELECTRIC RAILWAY JOURNAL* of June 19, page 1180. The notes are dated June 15, 1915, and are due on June 15, 1917. The interest is payable on June 15 and Dec. 15 in Baltimore. The notes are in the denomination of \$1,000 and \$500. The Kanawha Traction & Electric Company was incorporated in April, 1915, and on June 7, 1915, absorbed by consolidation the Parkersburg, Marietta & Interurban Railway, which was incorporated in 1902, and purchased the properties of the Parkersburg Gas, Electric Light & Street Railway Company, the Parkersburg Interurban Railway and the Marietta Electric Company and leased the property of the Muskingum Traction Company. There are outstanding \$150,000 of first mortgage 5's of 1938 of the Parkersburg Gas, Electric Light & Street Railway, \$550,000 of consolidated 5's of 1942 of the Parkersburg, Marietta & Interurban Railway, \$150,000 of first mortgage 6 per cent bonds of the Marietta Electric Company due in 1942 and \$1,100,000 of two-year 5 per cent notes of the Kanawha Traction & Electric Company due on June 15, 1917. The Kanawha Traction & Electric Company has authorized \$1,500,000 of common stock and \$1,500,000 of 6 per cent preferred stock, cumulative after July 1, 1916. Of the common stock \$1,100,000 has been issued and of the 6 per cent cumulative preferred stock \$1,078,500 has been issued.

Lake Erie, Bowling Green & Napoleon Railway, Bowling Green, Ohio.—On June 25 Judge Killits of the Federal District Court at Toledo granted a decree for the sale of the Lake Erie, Bowling Green & Napoleon Railway. The action was taken in the case of the Union Trust Company against the railroad.

Lima & Honeoye Light & Railroad Company, Lima, N. Y.—The Public Service Commission of the Second District

of New York has refused to allow the Lima & Honeoye Electric Light & Railroad Company and the Lima-Honeoye Light & Railroad Company to separate their electric light from their railway business, on the ground that this would result in a default under the lease between companies approved by the commission in 1910, to the disadvantage of the public, as the operation of the railroad would be ultimately abandoned because it is unprofitable.

New Orleans Railway & Light Company, New Orleans, La.—E. H. Rollins & Sons, Boston, Mass., are offering at 100 and interest a block of 6 per cent debentures of the New Orleans Railway & Light Company of 1913 due on June 1, 1916.

New York (N. Y.) Railways.—An additional \$500,000 of first consolidated mortgage 5 per cent fifty-year bonds of the Broadway & Seventh Avenue Railroad due in 1943 has been listed on the New York Stock Exchange. This makes the total of this issue listed to date \$8,150,000. The bonds are issued from escrow to refund the same amount of second mortgage 5's due in 1914.

Northern Ohio Traction & Light Company, Akron, Ohio.—Hayden, Miller & Company, Cleveland, Ohio, are offering at par and interest the unsold portion of \$500,000 of 6 per cent secured gold bonds of the Northern Ohio Traction & Light Company of 1915.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—A quarterly dividend of 1 per cent on the \$10,000,000 of common stock of the Omaha & Council Bluffs Street Railway has been declared payable on July 1 to holders of record of June 30, contrasting with 1¼ per cent paid quarterly from Jan. 1, 1912, to April 1, 1915.

Public Service Corporation of New Jersey, Newark, N. J.—There has been listed on the Philadelphia Stock Exchange \$261,000 of additional general mortgage 5 per cent sinking fund gold bonds of the Public Service Corporation of New Jersey due on Oct. 1, 1959. This makes the total amount listed to date \$36,998,000.

Puget Sound Traction, Light & Power Company, Seattle, Wash.—The Puget Sound Traction, Light & Power Company has declared a quarterly dividend of three-fourths of 1 per cent on its preferred stock, payable on July 15 to stock of record of July 2. This is a reduction of three-fourths of 1 per cent from the regular quarterly dividend of 1½ per cent, the dividend paid on April 15 having been at the latter rate.

DIVIDENDS DECLARED

Aurora, Elgin & Chicago Railroad, Wheaton, Ill., quarterly, 1½ per cent, preferred.

Chicago City & Connecting Railways, Chicago, Ill., quarterly, 1½ per cent, preferred participating certificates.

Chicago (Ill.) City Railway, quarterly, 2 per cent.

Columbus, Newark & Zanesville Electric Railway, Cincinnati, Ohio, quarterly, 1½ per cent, preferred.

Elmira Water, Light & Railroad Company, Elmira, N. Y., quarterly, 1¼ per cent, first preferred; quarterly, 1¼ per cent, second preferred; quarterly, 1 per cent, common.

Interstate Railways, Philadelphia, Pa., 30 cents, preferred.

Little Rock Railway & Electric Company, Little Rock, Ark., 3 per cent, preferred; 5 per cent, common.

London (Ont.) Street Railway, 3 per cent.

Manchester Traction, Light & Power Company, Manchester, N. H., quarterly, 2 per cent.

Nashville Railway & Light Company, Nashville, Tenn., quarterly, 1¼ per cent, preferred.

New England Investment & Security Company, Springfield, Mass., 2 per cent, preferred.

Omaha & Council Bluffs Street Railway, Omaha, Neb., quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Philadelphia Company, Pittsburgh, Pa., quarterly, 1½ per cent, common.

Porto Rico Railways, Ponce, Porto Rico, quarterly, 1¼ per cent, preferred.

Scioto Valley Traction Company, Columbus, Ohio, quarterly, 1¼ per cent, first preferred; quarterly, 1¼ per cent, preferred.

Western Ohio Railway, Lima, Ohio, quarterly, 1½ per cent, first preferred.

Winnipeg (Man.) Electric Railway, quarterly, 2½ per cent.

Traffic and Transportation

THE JITNEY BUS

Washington Bus Line in Receiver's Hands — Regulatory Ordinances in Philadelphia, Rochester, Flint, Taunton and Newport

H. S. Wilson has been appointed receiver of the Metropolitan Coach Company, Washington, D. C., by Judge Gould of the District Court. It is announced that the company will continue to operate its herdic line in Sixteenth Street N. W., between Pennsylvania Avenue and U Street under the direct supervision and management of Mr. Wilson. Officials of the company consented to the appointment of the receivers to take over its business following the filing of a suit in the District Supreme Court against the company in which it was alleged that James O'Donnell had been unable to collect on a judgment against the company in March, 1915, for the sum of approximately \$500.

The Metropolitan Coach Company has had an application pending before the Board of Public Utility Commissioners of the District of Columbia to authorize an issue of \$150,000 in bonds. The commission would allow only \$118,000 to cover necessary expenditures. In a letter to the Public Utilities Commission. S. Dana Lincoln, president of the company, said in part:

"Referring to your letter of April 14 and with reference to the previously declared attitude of the commission with respect to our application for permission to issue \$150,000 of bonds, we must repeat that the position taken by the commission is such as to make it impossible for us to finance our needs and therefore impossible to continue the operation of the Metropolitan Coach Company. As we have heretofore pointed out, the proposed issue of bonds would not, except as to the amount specified for new vehicles and garage, have increased the indebtedness of the company. It would, however, have enabled us to put an existing debt (which was incurred in establishing and equipping the motor vehicle service) in such form that it could have been carried at the same time to the company's improvement plans that were being executed. We have also expressed the opinion that in applying to the case of this company rules formulated with reference to the utilities of a wholly different character the commission takes the position that makes a further attempt to continue operation unprofitable and impossible."

The report of the company to the Public Utilities Commission of Washington for 1913, the latest available, contains the following operating figures: gross receipts, \$24,734; operating expenses, \$23,654, or 95.63 per cent of gross receipts; interest and taxes, \$4,381; loss for the year, \$3,301. At the beginning of 1913 the deficit was \$119,121, making the deficit at the close of 1913 \$122,422. The cost of equipment is given as \$22,997, and current assets \$1,181. Funded debt at the close of 1913 was \$95,600, and current liabilities \$26,001. In 1913 the line carried 577,539 passengers paying regular fare, and it carried 243,068 passengers on transfers from the Washington Railway & Electric Company's H Street line.

A measure to regulate the operation of the jitney has been passed by the Common Council of Rochester, N. Y., and is now before the Mayor for signature. Vehicles carrying five passengers are to pay a license fee of \$50. Vehicles carrying more than five passengers and not more than ten are to pay a tax fee of \$60. Vehicles carrying more than ten passengers are to pay a license fee of \$75. The bond required is \$3,000 for each car carrying not more than ten passengers and \$5,000 for each car carrying more than ten passengers. If an owner operates more than 100 jitneys he may give a blanket bond for \$25,000. A number of owners operating more than 500 jitneys may unite in one blanket bond of \$50,000. The fare by jitney is to be not more than 5 cents within the city. Jitneys are to be inspected once a month under the direction of the Commissioner of Public Safety, who is also authorized to designate hours and routes of service. The ordinance will not revoke any of the licenses granted previous to its adoption.

The Council of Flint, Mich., has passed an ordinance regulating the jitney, effective on July 15. The measure provides for a license fee ranging from \$25 for five-passen-

ger buses upwards and for a bond of \$5,000 to \$10,000 for buses of five to seven-passenger capacity and of \$20,000 for those over ten-passenger capacity. The regular seating capacity of the buses must not be exceeded.

The ordinance committee of the City Council of Richmond, Va., has recommended to the Council for passage an amended ordinance designed to regulate the jitney in that city. The proposed ordinance requires an indemnity bond, fixes certain routes and limits the carrying capacity of the vehicles. The committee after voting down several amendments adopted a motion fixing the bond of the first car at \$2,000, and \$500 for each additional car. The license fees for cars are fixed according to the route and the number of passengers carried. The minimum license for a four-passenger car is \$30 and the maximum license for a nine-passenger car is \$75.

A jitney regulatory ordinance has been passed in Taunton, Mass. The measure provides that no vehicles shall be operated for hire in Taunton until a license in the sum of \$100 has been obtained and that a bond in the sum of \$5,000 shall be taken out for the first vehicle and one of \$1,000 for each additional vehicle. The drivers of vehicles licensed under the measure are not to carry in their vehicles any passengers in excess of the designed seating capacity.

The police commissioners of Kansas City have rejected the proposal of the Kansas City Jitney Association that one of their members be made a special officer to help regulate traffic at the downtown jitney station, Twelfth Street and Grand Avenue. The starter of the association said he had been assisting in traffic regulations, and that if he had a commission he could work more effectively. The police board was averse to granting any special interest in transportation any authority over traffic, and the conclusion was that the police would continue to be the official regulators of traffic.

The City Commissioners of Austin, Tex., have passed an ordinance regulating the jitneys, the principal features of which are provision for a license fee of \$50 for five-passenger cars, \$75 for six-passenger cars and \$100 for seven-passenger cars; a bond of \$2,500 for the injury of one person in accidents and a bond of \$5,000 for the maximum damages which can be demanded by several persons who may be injured in a single accident. School children must be carried for not more than 3 cents when going to or from school. The ordinance prohibits the jitneys from operating on Congress Avenue between Fifth and Ninth Streets.

A jitney ordinance will go into effect at Newport, R. I., on July 5, 1915. The ordinance requires the operator to procure a special annual license from the Board of Aldermen. Six months' residence preceding the date of application is required. The license is fixed at \$2 per seat at the manufacturer's rating, with a maximum fee of \$50 per bus. The specification of stands is well covered in the ordinance. No license is to be issued until there is filed with the board an amount computed at the rate of \$250 per seat, with approved surety, conditioned in substance to pay all damages sustained in the conduct of the business. Violation of the ordinance is punishable by a fine not exceeding \$50.

On June 30 City Councils of Philadelphia, Pa., passed an ordinance establishing a 5-cent fare zone which the jitneys must traverse, extending on the north to Olney Avenue and on the south to League Island, with Thirty-third and Diamond Streets as an alternative northern terminus. On baseball days the jitneys may operate to Shibe Park. A license fee of \$50 must be paid for each machine and each driver must be bonded in the sum of \$2,500. The provision of the ordinance requiring cars to traverse the entire zone system caused a storm of protests from the jitney operators, and it is said that they will petition the mayor to veto the ordinance. On the same day that the regulatory ordinance was passed by Councils the June Grand Jury made its final presentment to Judge Patterson in the Court of Quarter Sessions. The jury recommended fixed regulation of jitneys and held it to be to the city's interest to protect the earnings of the Philadelphia Rapid Transit Company, inasmuch as the municipality is interested financially in that corporation. Dr. Ziegler of the Department of Public Health and Charities of the city has recommended that the drivers be forced to pass a rigid examination before being permitted to run automobiles. He reports that from April 1 to June 12 there

were 112 jitney accidents, causing injury to twenty-nine pedestrians and two deaths.

JITNEYS IN THE TEXAS COURTS

Judge Edward R. Meek of the United States Court for the Northern District of Texas, at Dallas, Tex., on June 19, dismissed the bill in the cause of the Forth Worth Auto Association vs. the City of Fort Worth. The judge held that he had no jurisdiction in the matter as there was no federal question involved. From this decision it follows that, in the opinion of Judge Meek, the original jitney ordinance was not a contract and the passage of the amended ordinance, which made the first ordinance inoperative, did not result in confiscation of property and did not violate the fourteenth amendment of the federal constitution.

Before the hearing Judge Meek said that he had grave doubts as to his jurisdiction in the matter, but in order that partiality might not be shown he decided to listen to the argument of the counsel. City Attorney Altman argued that the first ordinance was not a contract but a franchise and that the city had the right absolutely to terminate any license granted under the ordinance and should be permitted to make additional terms under which the jitneys should operate. He denied that any discrimination had been shown or that the men would be unable to make the bond as claimed. At the conclusion of the arguments, Judge Meek requested that the ordinance, which was to have gone into effect on June 17, be suspended until he had time to determine whether a federal question were involved. This suspension was granted by Mayor Tyra. On June 19, Mays & Mays, attorneys for the jitney union, received a brief letter from Judge Meek in which he stated:

"After careful consideration I have reached the conclusion that the United States District Court is without jurisdiction to entertain the application for the injunction."

When informed of the decision, Police Commissioner Hurdleston said:

"The ordinance is now in effect and the police will proceed to enforce it without further instructions."

The jitney attorneys announced that an appeal would be made to the Supreme Court of the United States.

No decision has as yet been handed down by the Fifth Court of Civil Appeals on the hearing of the application for an injunction sought by the jitney union to restrain the enforcement of the jitney ordinance by the city of Dallas, Tex. The case was taken under advisement on June 12. The Court of Appeals remains in session until July 3, and it is expected that a decision will be rendered on June 26. In any case the ordinance, by agreement, will not go into effect until July 15.

Judge Marvin Brown of the Sixty-Seventh District Court at Fort Worth, Tex., declined to release I. W. Sullivan, the jitney driver, on his application for habeas corpus which was heard June 14. Sullivan was found guilty in the County Court of violating the first jitney ordinance and the decision was affirmed by the Court of Criminal Appeals. When the mandate of the Appellate Court was received by the County Court, attorneys for the defendant applied for a writ of habeas corpus on the grounds that the second ordinance had repealed the first and that the defendant should not be punished for violation of an ordinance which no longer existed. After hearing the case Judge Brown decided against the contention of the defendant. The case was promptly appealed to the Court of Criminal Appeals.

A temporary injunction restraining the enforcement of the Fort Worth jitney ordinance has been granted by Judge Marvin H. Brown of the Sixty-seventh District Court on an application filed by the Auto Transit Company, a private corporation chartered for fifty years. Members of the jitney union who have offered resistance to the ordinance in the courts without effect, joined as intervenors with the Auto Transit Company after the injunction suit was filed. The petition holds that both the original ordinance and the amended one are unreasonable, discriminatory, and void and in violation of the Constitution of the United States and of the State of Texas. It is argued that the Northern Texas Traction Company is operating street cars for hire and is not required to pay any license fee or occupation tax, nor is it required to execute any sort of bond. A bond of \$500 was required by the court of the plaintiff.

SEATTLE COMPANY TO RUN JITNEYS

According to A. L. Kempster, general manager of the Puget Sound Traction, Light & Power Company, Seattle, Wash., the company will engage in the jitney business in that city. In discussing the plans of the company, Mr. Kempster said:

"Experience is showing us that the public demands faster service. The time for romance and platonic consideration of conditions is past. We will fight fire with fire. If the public demands that we give fast service in small units, with correspondingly few stops, we shall do so. Not only does the jitney cost us less to operate but it gives us a certain amount of freedom from franchise and public service regulation. How soon the new plan will go into effect is problematical, but we are ready to protect our property by giving the public exactly what it wants. As a matter of fact, the saving in our rail upkeep and in the care of overhead wire and in carhouse costs will pay the cost of upkeep and repairs, and go a long way toward the primary cost of such machines as we may be compelled to purchase.

"The problem of whether the public wants motor service is answered by decreased receipts. The company feels that it can go further toward giving reliable service to the public through the jitney bus as a medium than can any individual. It goes without saying that we are responsible. That is a big feature. There cannot be speed without an occasional smash-up. If we are willing to let our claim department settle with real cash for any accident directly attributable to our service, we are doing the riding public a service. Under the present bonding system, a month, two months, three months may elapse before a claim is settled. With us, the presentation of proofs that we are blame-worthy is sufficient basis on which to establish negotiations for a cash settlement.

"Great, big motor-propelled cars will never be run by the Puget Sound Traction, Light & Power Company as mediums of transportation. The minute this is done the automobile is put into the class of the street car, with as many stops and consequent loss of time. Neither will the heavy freight business pass to the automobiles. The package-carrying business was dropped by us many months ago, and nothing is left now but the heavy freight and the straight passenger-carrying business. Conditions at present are unusual, 'unordinary,' or remarkable, according to the viewpoint, but the fact remains that if the public demands the automobile, we shall furnish it and it will be a service no citizen need be ashamed to patronize."

At present the electric railway pays Seattle 2 per cent of its gross earnings, but this will not be required of the subsidiary jitney company. The present revenue of \$70,000 a year to the city from this source will be reduced materially, and other obligations, including that of building and maintaining street paving, will be removed in a large measure. It is stated that the company's receipts have fallen off about \$2,000 a month on account of the jitney, which pays only a vehicle license to the city. The new jitney service of the company will cover only short runs, as it is unnecessary to enter long-haul traffic, which is unprofitable to the street cars and to the jitneys. It is even intimated that the suburban service of the company will be curtailed on account of its unprofitable character.

JITNEY ORDINANCE VALID

An important decision has just been handed down by the Supreme Court of Appeals of West Virginia upholding the rights of cities of that State to regulate the jitney. The city of Huntington had passed an ordinance on the jitney bus with the usual restrictive provisions, requiring among other things from owners of jitneys the filing of a \$5,000 bond and a statement from the applicant as to the terminals and routes over which the cars were to operate and the hours of their operation. The case was brought to the Supreme Court on a writ of habeas corpus charging illegality of the ordinance for a violation of which the relator was held in restraint of his liberty.

In its opinion denying this writ the court showed at length that every city in West Virginia had the power to limit and regulate the use of vehicles kept for hire and that it might classify them for purposes of regulation, and an ordinance

dealing with one class of such vehicles, as determined by the nature of their business and the prices they charge, is not discriminative because of its lack of provision for the regulation of other distinct classes of vehicles kept for hire. The case was entitled No. 2906 ex parte M. T. Dickey, and it is said to be the first decision by the highest court of any State on the legality of jitney regulation in cities.

THE TENNESSEE JITNEY DECISION

Abstract of Decision Rendered by Circuit Court Judge Holding the State Law Unconstitutional

In a decision holding the Tennessee jitney law to be unconstitutional rendered by Judge A. B. Pittman of the Third Division of the Circuit Court at Memphis and referred to briefly in the *ELECTRIC RAILWAY JOURNAL* of June 26, page 1225, the court said in part:

"It is not open to debate or doubt that the Legislature may define and declare what constitutes a common carrier; that it may define and declare privileges; that it may classify different privileges for purposes of taxation, and also for other purposes; that municipalities may regulate the use of its streets and impose such reasonable terms and conditions upon the users as it may deem wise. The only restriction under the constitution is that the classifications must be natural and reasonable and not arbitrary and discriminatory.

"The act under examination in this case declares the jitney bus to be a common carrier, and provides among other things that such common carrier shall give a bond conditioned that such carrier will pay any damage that may be adjudged finally against such carrier as compensation for loss of life or injury to person or property inflicted by such carrier or caused by his negligence.

"Passing the question of the right to classify the jitney so as to compel it to protect its passengers, what possible justification is there for classifying it so as to compel it to afford protection to the street-using public in general, when no such burden is placed upon owners of private automobiles? Whatever might be said of the Legislature's power to regulate the jitney as a carrier of passengers and to require bond for the protection of such passengers the law leaves no room for doubt that the Legislature may not impose upon the jitney a burden as to street using pure and simple not imposed on others using the streets in identically the same manner.

"I hold the act in question (being chapter 60 of the acts of 1915) unconstitutional, and void, in that it is class legislation of the most glaring character, is arbitrary and discriminatory, and violative of the constitution of Tennessee. The relator herein will be discharged and the costs of this proceeding taxed against the city of Memphis."

DETROIT PURCHASE ULTIMATUM

The Board of Street Railway Commissioners of Detroit, Mich., has sent an ultimatum to the Detroit United Railway to the effect that unless the company accepts the terms of a purchase contract by July 6 all negotiations for the purchase of the lines of the company within the one-fare zone will be called off. For several weeks attorneys representing the city and the company have been holding conferences with a view to drafting an agreement to provide for submitting the purchase proposition to the electors, the understanding being that the price of the property was to be fixed by the Circuit Court of Wayne County. The Street Railway Commission has issued a statement to the effect that the company has sought to get language into the agreement which would tie the hands of the court and be prejudicial to the interests of the city, and in its ultimatum it gives notice that the company must accept the contract as the city wants it or the commission will "proceed immediately to acquire a railway by other ways and means." The ultimatum came as a surprise, inasmuch as frequent statements have been forthcoming from the commission indicating that the differences between the attorneys were largely with respect to details. The company has not indicated what course it will pursue in dealing with the latest phase of the purchase negotiations, but it is highly improbable that the company will accept any agreement which it does not believe protects its interests properly.

Wages Restored.—The Gulfport & Mississippi Coast Traction Company, Gulfport, Miss., which reduced the wages of its employees last October, has restored them to the former scale.

One-Man Cars in San Antonio.—The City Commissioners of San Antonio, Tex., have granted permission to the San Antonio Traction Company to use one employee on the cars of several of its local lines.

Toilet Facilities Ordered.—The Public Utilities Commission of Kansas has ordered the Joplin & Pittsburg Railway to provide toilet facilities on all of its cars. The order is based upon an act of the Legislature of 1915.

Accident in Brooklyn.—Slippery rails, due to a storm, caused a rear-end collision on the night of June 27 between a Vanderbilt Avenue surface car and a Culver line train, at Neptune Avenue near Van Siclen station, Coney Island, in which fourteen persons were injured.

Fare Increase Suspensions.—The Public Service Commission of Massachusetts has suspended until Aug. 1 the proposed increase in passenger fares and fare limits on the Norfolk & Bristol Street Railway, and proposed increase in fares on the New Bedford & Onset Street Railway.

Traffic Interchange in Illinois.—An interchange of freight has been arranged between the Illinois Traction System, Peoria, and the Kankakee & Urbana Traction Company, Urbana, Ill., intrastate tariffs being effective on June 12 and interstate rates effective on July 10. All shipments are routed via Urbana, Ill.

Traction Lines to Feature the Liberty Bell.—The Fort Wayne & Northern Indiana Traction Company and other interurban lines entering Fort Wayne, Ind., will run excursions into that city on July 6, when the Liberty Bell, en route to the Panama-Pacific Exposition in San Francisco, will be exhibited in Fort Wayne.

High Speed Camden-Newark Service.—Fast through service to New York every hour has been inaugurated by the Public Service Railway from Camden, opposite Philadelphia, by way of Trenton and New Brunswick, to Newark, where connection is made with the Hudson & Manhattan Railroad. The running time is five hours, and the fare is \$1.45 for one way, and \$2.60 for the round trip.

Seattle Service Case.—Federal Judge Neterer at Seattle, Wash., has signed an order allowing the Puget Sound Traction, Light & Power Company to perfect an appeal to the United States Supreme Court on the order of the State Public Service Commission requiring the company to furnish a seat for every passenger, as well as to run its Alki Point, Fauntleroy Park, and Ballard Beach lines beyond the downtown termini provided by the company's charter.

The Memphis Fare Case.—The case involving the efforts of the city of Memphis, Tenn., to compel the Memphis Street Railway to issue transfers on tickets sold at the rate of eleven for 50 cents, has been argued before the State Supreme Court sitting at Jackson. A writ of mandamus issued by the lower court was taken to the Appellate Court by the railway and went in favor of the company. The city is aggressor in the present review of the case in the highest court of the State.

The St. Louis Skip-Stop Hearing.—Additional testimony was taken before the Public Service Commission of Missouri in St. Louis on Jan. 26 in regard to the petition of the United Railways for permission to eliminate 770 stops in the city. Application has been made to the commission by the company for a rehearing in regard to the order of the commission requiring the company to construct certain extensions and install loops. The requirements of the commission with respect to extensions and loops was referred to in the decision of the commission abstracted in the *ELECTRIC RAILWAY JOURNAL* of May 15, page 961.

The Free Transportation Menace.—A tentative clause in a franchise for the construction of an extension in Los Angeles, Cal., has resulted in a statement from the Los Angeles Railway Corporation with respect to free transportation. The clause in question sought to extend the courtesy of free transportation on all lines of the company to all nurses of the health department. The company objected to this. S. M. Haskins of counsel for the company

said: "The history of free transportation in Los Angeles is written in the ordinances of the city. It began with the Mayor and members of the fire department, and it has been increased gradually until the amount of free transportation furnished by the Los Angeles Railway to the city of Los Angeles amounts to more than \$200,000 annually."

Operating Trailers in Washington.—As a result of observations made of the operation of trains of two small open cars of the Capital Traction Company, Washington, D. C., and of records kept by the commission and the company of accidents occurring on these cars, the Public Utilities Commission of the District of Columbia is of the opinion that the operation of the small single truck open cars in trains of two cars each with a single conductor in charge of the train is not a menace to public safety. It has therefore ordered that Section 13 of Order No. 21 of the commission be amended to read as follows: "No trailer car shall be operated for the purpose of carrying passengers unless there be a separate conductor or employee acting as such for each car of the train; provided, that trains of small single-truck open cars not exceeding two cars each may be operated with a single conductor in charge of the train."

The Albany Service Case.—A conference was held at Albany, N. Y., on June 23 between officers of the United Traction Company of that city and the members of the Public Service Commission of the Second District of New York with respect to the order of the commission calling for the purchase of forty cars, each with a minimum seating capacity of forty passengers. Chairman Van Santvoord said that the commission felt that conditions were correctly set forth in the data the commission already had, and that the order of the commission must be complied with or the company, in accordance with the decision of the Appellate Division of the Supreme Court, must show that it cannot comply with it. It was finally agreed that the company should submit to the commission not later than July 6 an alternative plan for improving the equipment. This plan may involve either the purchase of new cars or the rebuilding of the old ones, provided this can be done in a satisfactory manner.

The Shore Line Wage Agreement.—As stated in the *ELECTRIC RAILWAY JOURNAL* of June 26, page 1226, the Shore Line Electric Railway, Norwich, Conn., has agreed with its trainmen to an advance of wages from a minimum of 22 cents and a maximum of 28½ cents an hour to a minimum of 23 cents and a maximum of 29 cents an hour. While it is a fact that the company has increased its wage rates practically one-half cent in each grade, it has at the same time eliminated the overtime payment of 10 cents an hour and the lunch checks. The original purpose of the lunch checks was to protect the men who were detained from their homes or regular eating places, and as a consequence were put to an expense. Under the former agreement the men twice a year elected whether they would take box lunches or 25 cents. For the past year the company has not been asked for a lunch box, and the management felt that it would be fairer to all the men if the money represented by the lunch boxes was distributed among all the men rather than to a favored few. The change in the rate of pay, as frankly stated to the men, will not add materially to the cost of operation of the company, as the increase is very largely offset by the saving which results from the changes previously mentioned.

The Value of Action.—A preachment to railway men that carries a valuable lesson was contained, no doubt unconsciously but none the less effectively, in an item published recently in Louisville. Around it could be woven a second "Message to Garcia." It illustrates strikingly the value of independent action. On account of the lesson which it contains the Louisville (Ky.) Railway is calling the attention of its trainmen to the item, which follows: ". . . On Main Street, between Fifth and Sixth Streets (a busy section of the street, traversed by cars of five important lines, three of which loop there), a wheel came off a wagon and blocked the line. In a very few minutes several cars were tied up by the blockade. One man called the wreck car and then they all stood around trying to talk that wheel back on the wagon. Then something happened—a man came along who could see things. He asked the

driver to take out the wagon tongue, which they used as a pry pole, chocked the wheels with a brick, and raised the axle slightly and put the rim of the wheel under it; got a new bight, raised it again, and put the hub under it, then with another effort the wheel was on and the blockade relieved in just two minutes after the 'live wire' got there. The wreck car found a clear track."

Question of Authority in Canada.—The First Appellate Court at Toronto, Ont., has granted the petition of the Hamilton, Grimsby & Beamsville Electric Railway, Hamilton, Ont., for an appeal against the decision of the Ontario Railway Board made some time ago to compel the company to place certain conveniences in the cars and stations, also on the question as to whether the Dominion of Canada, once having declared a railway for the general advantage of Canada, can subsequently withdraw that declaration. The company claimed that it was outside the jurisdiction of the Ontario Board to require the company to install the conveniences, and that under a section of the railway act of 1888 the railway was placed under the Dominion Railway Board, which alone could exercise authority over it. Counsel for the company pointed out that the dominion by the railway act of 1888 declared all railways crossed by the Grand Trunk and the Canadian Pacific Railways to be works for the general advantage of Canada. By an enactment of 1903, which counsel for the company challenges as *ultra vires*, the dominion purported to limit this declaration to the crossings only. For twenty years his clients had considered themselves under the Dominion Railway Board, and still did so. The question will be argued later on appeal.

Lexington Arbitration Award.—The board of arbitration which has been handling the case of Motorman Robert E. Walker, discharged last summer by the Kentucky Traction & Terminal Company, Lexington, Ky., has reported, reinstating the motorman and awarding him \$200 of back pay. The proposition was referred to the board as a means of compromising the strike which followed Walker's discharge. The union men in the company's employ contended that Walker was dismissed through discrimination against the union. The company urged that the dismissal was purely for carelessness, which resulted in the wreck of an inter-urban car. C. C. Bagby, a Danville attorney, was named umpire, the union chose its president, Robert Goss, and the company its own superintendent, George McLeod. The decision was a majority finding, holding that the company acted in part from "unconscious prejudice" and that the case did not merit such severe treatment. Supplemental charges that the company discriminated against union employees were dismissed by the board of arbitration as not sustained by the evidence. The minority report, by Mr. McLeod, pointed out that Walker had been dismissed in good faith, "the opinion of the umpire to the contrary notwithstanding," and that he would be reinstated in equally good faith.

Peninsula Railway Fare Case.—F. E. Chapin, general manager of the Peninsula Railway, San José, Cal., has issued a statement in regard to the recent fare decision of the Railroad Commission of California, referred to in the ELECTRIC RAILWAY JOURNAL of May 8 on page 911. Mr. Chapin said in part: "The published reports in relation to the decision of the State Railroad Commission as to the complaint of Palo Alto and Mayfield complaining of discrimination in favor of San José, have been in error and have led to much confusion in the minds of our patrons. Briefly, the decision of the commission is, first, that night excursion rates, which have been so lightly availed of by the traveling public, can be withdrawn by the Peninsular Railway; second, that the Sunday excursion rate from Mayfield and Palo Alto to Congress Springs cannot be raised without discrimination in favor of San José, as it is now; third, that after allowing for the influence of 5-cent street railway fares which ordinarily should not influence inter-urban fares, but which sometimes cannot be avoided, discrimination in favor of San José against Palo Alto and sometimes in favor of Los Gatos as against Palo Alto, is found, and exists to an extent that demands the revision of existing rates. The present tariffs, which have developed just as the road has grown are being revised accordingly, but it should be apparent to all that the decision does not in itself direct reduction in rates."

Personal Mention

Mr. R. H. Smith, formerly engineer of the Ogden, Logan & Idaho Railway, Ogden, Utah, has been appointed manager of the Goldsboro (N. C.) Electric Railway.

Mr. John H. Adams, formerly chief engineer of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., has been appointed general manager of the Blue Ridge Light & Power Company, Staunton, Va.

Mr. Timothy E. Byrnes, formerly vice-president of the New York, New Haven & Hartford Railroad, has established himself in Boston in his former business as legal adviser concerning railroad rates and transportation.

Mr. John W. Wagner president of the German-American Bank, Kansas City, Mo., and not Mr. John W. Brown, as previously reported, has been reappointed as a member of the board of the Kansas City Railways to represent the city.

Mr. R. B. Stichter, vice-president of the Southern Traction Company, Dallas, Tex., has been granted a six months' leave of absence. Mr. Stichter will leave at once for Colorado and expects to spend the greater part of his vacation in the mountain resorts of that State.

Mr. R. F. Blanchard has resigned as chief engineer of the power station of the Holyoke (Mass.) Street Railway to become associated with Mr. William Butler, formerly construction engineer of the Economy Fuel Company, Matteawan, N. Y., in the firm of Blanchard & Butler, Boston, Mass., dealers in engineers' supplies. The employees of the Holyoke Street Railway presented Mr. Blanchard with a traveling bag and toilet set as a token of esteem. He has been connected with the company for more than five years.

Mr. John J. Dempsey, who was elected president of the New York Electric Railway Association at the meeting at Manhattan Beach on June 29 and 30, is superintendent of

J. J. DEMPSEY

transportation of the New York Consolidated Railroad (Brooklyn Rapid Transit System). Mr. Dempsey started his railroad career as a boy with the Lehigh Valley Railroad. In 1894 he severed his connection as telegraph operator with that company to take a position as telegraph operator with the Brooklyn (N. Y.) Union Elevated Railroad. He remained with this company until June, 1897, when he resigned to return to the Lehigh Valley Railroad as telegraph operator, from which position he was promoted to yardmaster. In

1900 he left the Lehigh Valley Road and re-entered the employ of the Brooklyn Rapid Transit Company as assistant dispatcher, from which position he was successively advanced to dispatcher, trainmaster, chief dispatcher, assistant superintendent and finally superintendent of transportation.

Mr. W. S. Stanton, the newly-elected secretary-treasurer of the New York Electric Railway Association, is exceptionally well qualified for the responsibilities of his office, as during the past few years he has been secretary to two of the presidents of the association, Messrs. Peck and Hamilton. Mr. Stanton was born in 1882, and his railway experience began eleven years ago when he entered the service of the Schenectady Railway. He has remained with that system without interruption since that time, being engaged in various positions in the clerical department of the company. For the past eight years he has held the title of secretary to the general manager, Schenectady Railway, and he will retain that position in addition to his secretaryship of the New York associations, as his central location and familiarity with association affairs will enable him readily to combine the duties of both.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

FRANCHISES

New Britain, Conn.—The Connecticut Company has asked the Council for a franchise to extend its lines from Main Street to Myrtle Street, Grove Street, Broad Street, Washington Street, Farmington Avenue, and Commonwealth Avenue to a point 100 ft. beyond Farmington Avenue, New Britain.

***Lakeland, Fla.**—Application is being made to the Council for a franchise to construct a line in Lakeland in connection with a railway to extend to and through surrounding towns, providing a similar franchise is obtained through and along the principal business and residence thoroughfares. A committee of the Chamber of Commerce is working out the details and has been assured of the necessary capital as soon as the franchises and rights-of-way have been secured. Among those interested are G. C. Rogan, M. F. Hetherington, Dr. S. F. Smith, W. F. Sneed, and A. J. Holworthy.

Newport, Ky.—Bids will be received until Aug. 2 by the City Commissioner of Newport for an electric railway franchise. August Helmbold, Mayor.

Springfield, Mass.—The Springfield Street Railway has asked the Council for a franchise to construct a line along Page Boulevard to East Street in Chicopee.

Woburn, Mass.—The Bay State Street Railway has asked the Council for a franchise to alter and relocate its tracks on Washington Street, Woburn.

Farrell, Pa.—The Farrell & Mercer Railway has received a franchise from the Council to construct an electric line in Mercer. This is part of a plan to build an electric railway from Farrell to Mercer and New Castle.

Lynchburg, Va.—The Lynchburg Traction & Light Company has received from the Council a franchise to extend its line from the Fair Grounds to Fort Hill. Work will be begun at once on the extension.

TRACK AND ROADWAY

Fresno (Cal.) Interurban Railway.—Construction of the overhead work has been begun by this company on its line on Belmont Avenue from Fresno Avenue to Valeria Avenue, extending on Valeria Avenue to Merced Avenue and thence to J Street.

Pacific Electric Railway, Los Angeles, Cal.—Plans for the construction of four viaducts to span Macy Street, First Street, Fourth Street and Seventh Street to eliminate the dangerous grade crossings are being prepared by the Board of Public Utilities for presentation to the Council. The plans tentatively worked out by the Board of Public Utilities provide that the cost shall be borne one-half by the steam roads and one-half by the city, the county and the Pacific Electric Railway. The total cost of the four viaducts will be \$3,500,000.

San Diego, Cal.—Lewis R. Kirby reports that, owing to the failure of the El Centro trustees to concede a satisfactory route and conditions of operation for the proposed electric railway between El Centro and Imperial, and because of general business conditions, the plan of constructing the railway has been abandoned, at least temporarily. [May 2, '14.]

Municipal Railways, San Francisco, Cal.—The Mission Promotion Association has asked the Board of Supervisors to extend some of its lines in San Francisco. The line which the association urges most strongly is the extension of the Potrero Avenue branch from Tenth Street and Potrero Avenue along Division Street and thence to the Southern Pacific station at Third Street and Townsend Street. From this point the extension would continue to the Pacific Mail docks and to the waterfront.

Mount Carmel Railway, Hamden, Conn.—Willis M. Cook advises that the project to build an electric line from the terminal of the Connecticut Company's line to the top of Mount Carmel has been abandoned. [Oct. 4, '13.]

***Pocatello, Idaho.**—Plans are being considered to build an electric railway from Arbon, Oneida County, to Pocatello. George Williams, Mayor of Pocatello, is interested.

Peoria, Ill.—The immediate construction of the interurban line between Chillicothe and Peoria, which has been in the course of negotiation for some time, was assured at a meeting of the stockholders held in Chillicothe on June 15, at which the engineers who have been making the preliminary survey were present. From the end of the tracks of the Peoria Railway at Riverview Park to the Santa Fé station in North Chillicothe will require the construction of 15.26 miles of track, which, together with the necessary poles, wires, power house and stations, will cost approximately \$500,000. E. F. Hunter, Peoria, is interested. [Dec. 25, '14.]

St. Joseph Valley Traction Company, Elkhart, Ind.—In connection with the paving of East Jackson Street this company plans to replace its present tracks, turnouts and switches with new material. The track will be relaid with new open-hearth steel rails not less than 60 ft. long and weighing not less than 90 lb. to the yard. The ties will be 6 in. x 8 in. and 7 ft. long.

Terre Haute, Indianapolis & Eastern Traction Company, Terre Haute, Ind.—Citizens of Newcastle have filed a petition with this company asking that the company extend its city lines in Newcastle.

Southwestern Interurban Railway, Coffeyville, Kan.—Plans are being considered by this company to extend its line from Winfield to the Albright Gardens near Oxford, extending north through Mulvane to Wichita, where it will connect with other interurban lines. It is proposed to construct a line from Wellington to Mulvane to connect with the main line.

Bangor (Me.) Railway & Electric Company.—Work has been begun by this company double-tracking its lines on Harlow Street, Central Street and State Street, Bangor.

Bay State Street Railway, Boston, Mass.—Work will soon be begun by this company extending its double tracks from the corner of Hampshire Street and High Street to Railroad Square, Lawrence.

Springfield (Mass.) Street Railway.—Extensive repairs have been begun by this company in Springfield. The company will retie the entire stretch of track on Walnut Street from King Street to Hancock Street. The track will also be repaired at Memorial Triangle and in the Winchester Park section of State Street from Catharine Street to the New England crossing. The present rails will be replaced on Main Street on the west side of the north-end green. The company is also at work on Elm Street between Park Street and Westfield Street, West Springfield, where 60-lb. rails will be replaced by 80-lb. rails and the same procedure will be followed at Tubb's Hill on Westfield Street. The 7-in. rails on the Sumner Avenue line between the carhouse and the crossing will be removed and replaced by heavier rails.

Worcester (Mass.) Consolidated Street Railway.—Work has been begun by this company laying new rails on West Boylston Street, Worcester, between Chadwick Square and the fair grounds.

Gulfport & Mississippi Coast Traction Company, Gulfport, Miss.—Among the improvements being made by this company is the rebuilding of all bridges on its line from Biloxi and Pass Christian and the replacement of all defective poles.

Metropolitan Street Railway, Kansas City, Mo.—Plans are about completed for the single-deck viaduct and bridge to replace the Central Avenue double-deck structure over the Kaw River. At present the elevated structure of the Metropolitan Street Railway connects with the second deck of the Central Avenue bridge. The roadway on the lower deck extends on the ground level several hundred feet and connects with a viaduct that reaches the higher street level at the bluffs of Riverview. The new viaduct will be a single deck and will be about the present level of the upper deck. There will be viaduct approaches connecting with the roadway viaduct and approaches to the lower level roadway of the east side of the Kaw River. The total cost of the bridge and viaduct will be \$450,000.

United Railways, St. Louis, Mo.—This company has received permission from the Board of Public Service to lay double tracks across the new Jefferson Avenue Viaduct, St. Louis.

Lincoln (Neb.) Traction Company.—This company has received permission from the Council to tear up its N Street line and relay the track on K Street, Lincoln. The company will begin work on the K Street line at once, and will maintain service on N Street until the new line is ready to carry traffic.

Brooklyn (N. Y.) Rapid Transit Company.—Bids are desired by the Public Service Commission for the First District of New York for furnishing approximately 37,800 tons of open-hearth track rails and about 2400 tons of open-hearth guard rails for equipping the new lines of the dual system.

Brooklyn (N. Y.) Rapid Transit Company.—The Public Service Commission for the First District of New York will open bids on July 20 for the construction of Section No. 1 of Route No. 49, a part of the Culver line. This a three-track elevated railroad, which will connect the Fourth Avenue subway through Thirty-eighth Street and Gravesend Avenue with Coney Island. Section No. 1 extends from a point in Thirty-seventh Street 246 ft. southeast of Tenth Avenue under private property and intersecting streets to Gravesend Avenue and over Gravesend Avenue to a point about 525 ft. south of Bay Parkway (Twenty-second Avenue).

International Railway, Buffalo, N. Y.—This company is rebuilding its Niagara Street line from Forest Avenue to Hertel Avenue with a concrete roadbed and heavier rails. The East Utica Street line is also being rebuilt on Kensington Avenue from the Erie tracks to Bailey Avenue.

Interborough Rapid Transit Company, New York, N. Y.—This company has received permission from the War Department to construct a bridge over the Bronx River at Westchester Avenue. The bridge will carry the tracks of the Pelham Bay Park branch of the Lexington Avenue subway, which at this point runs on an elevated structure. A permanent bridge will be built with a clearance of 61 ft. above mean high water.

Poughkeepsie City & Wappingers Falls Electric Railway, Poughkeepsie, N. Y.—This company plans to spend about \$150,000 for improvements, including the reconstruction of track and extension of double track.

New York State Railways, Rochester, N. Y.—This company has been asked to double track its line on North Street, Rochester.

Western Ohio Railroad, Lima, Ohio.—Plans are being considered by this company to extend its line from St. Mary's south to Covington, via Minster and Fort Laramie.

Toledo, Bowling Green & Southern Traction Company, Toledo, Ohio.—Plans are being considered by this company to extend its line from Findlay to Kenton.

Toronto, Ont.—The Ontario Hydro-Electric Power Commission has completed surveys for the construction of the proposed railway from Toronto to Montreal and Ottawa. Plans have also been prepared for the construction of a radial railway to extend 60 miles north and west of London, Ontario.

Lehigh Valley Transit Company, Allentown, Pa.—It is reported that this company will begin work in the fall on a new route through Center Valley on its Philadelphia division. It is proposed to remove the tracks to private right-of-way for about 2 miles.

Easton & Washington Traction Company, Easton, Pa.—This company plans to construct a line between Washington and Hackettstown, N. J., extending along Lake Hopatcong, 19 miles.

McConnellsburg & Fort Loudon Railway, McConnellsburg, Pa.—Bennett & Randall, contractors, plan to begin work at once on this company's line from McConnellsburg to Fort Loudon, 10 miles. [May 8, '15.]

Scranton & Binghamton Traction Company, Scranton, Pa.—During the year this company plans to spend about \$1,000,000 in building a 20-mile extension of its line, and 3000 tons of rail will soon be delivered for use in the construction of the line.

Nashville, Springfield & Northern Railroad, Nashville, Tenn.—Surveys will soon be begun by this company on its proposed line between Nashville, Springfield, Clarksville, Tenn., and Franklin, Ky. [June 19, '15.]

Virginia Railway & Power Company, Norfolk, Va.—This company reports that it has made about \$25,000 worth of improvements at Ocean View in the way of new amusement devices and remodeling the hotel. An entirely new bulkhead has also been constructed.

***Wheeling, W. Va.**—Plans are being contemplated to construct an electric railway from Wheeling, W. Va., to Baltimore, Md., via Fairmont and Grafton. Preliminary surveys will be made at once. The Pennsylvania Electric & Lighting Company, Valley Falls, is interested.

SHOPS AND BUILDINGS

Arkansas Valley Interurban Railway, Wichita, Kan.—This company has purchased a site 66 ft. x 66 ft. at 111 Second Avenue East, Hutchinson, where its new terminal station will be erected. It is planned to construct a wye into the station off Second Avenue. The cost of the property was \$6,850.

Lewiston, Augusta & Waterville Street Railway, Lewiston, Me.—This company has completed its freight station at Lincoln Street, Lewiston.

New York Municipal Railway Corporation, Brooklyn, N. Y.—Contracts for the construction of eight elevated railroad stations in connection with the third-tracking of the Broadway elevated railroad in Brooklyn, submitted by the New York Municipal Railway Corporation, have been approved by the Public Service Commission for the First District of New York. The proposed stations are at Hewes Street, Lorimer Street, Flushing Avenue, Myrtle Avenue and Broadway, Kosciuszko Street, Gates Avenue, Halsey Street and Chauncey Street.

Salt Lake & Ogden Railway, Salt Lake City, Utah.—Pending the construction of a new terminal station, the depot offices of this company, with the exception of the freight department, have been removed to the temporary terminal at Third South Street and First West Street, Salt Lake City, which will be used jointly with the Salt Lake & Utah Railroad. Passenger train service was inaugurated on June 19.

POWER HOUSES AND SUBSTATIONS

Metropolitan Street Railway, Kansas City, Mo.—This company has ordered one 3000-kw., 575-volt d. c., six-phase, twenty-five-cycle, 250-r.p.m. compound-wound commutating pole rotary converter; three 1000-kva., single-phase, twenty-five-cycle, 6600-volt high-tension to rotary voltage low-tension air-blast transformers; one blower outfit for the above transformers and three-panel switchboard for the control of same. The contract for this apparatus has been placed with the Westinghouse Electric & Manufacturing Company.

Ephrata & Lebanon Traction Company, Mauch Chunk, Pa.—This company reports that it has completed and placed in operation its two substations at Iona and Clay in connection with its change from storage battery to overhead operation.

Ogden, Logan & Idaho Railway, Ogden, Utah.—Two substations will be built by this company, one at the Utah Hot Springs and the other at Deweyville, to care for the distribution of power for the entire system between Ogden and Preston. Each station will cost about \$35,000, including equipment.

Kanawha Traction & Electric Company, Parkersburg, W. Va.—Preliminary work has been begun by this company for the construction of a power plant at Parkersburg, 140 ft. x 90 ft. The structure will be of brick and concrete. The condensers will be placed in a pit and the turbines will be installed on the floor immediately above. The cost is estimated at \$500,000. Sanderson & Porter, engineers.

Wheeling (W. Va.) Traction Company.—This company will discontinue the operation of its power plant at Benwood, but will hold the plant in readiness for emergency service. The new main power plant located at Forty-second Street, Wheeling, has been completed.

Manufactures and Supplies

ROLLING STOCK

New York & Queens County Railway, New York, N. Y., expects to order immediately six double-truck end-entrance cars.

Carolina, Greenville & Northern Railway, Greenville, Tenn., a new line, is preparing specifications for rolling stock. F. A. H. Kelley, Greenville, is chief engineer.

Isthmian Canal Commission, Major F. C. Boggs, general purchasing officer, will receive sealed proposals until Aug. 16 for twelve electric towing locomotives for canal locks.

Hutchinson (Kan.) Interurban Railway has purchased a Westinghouse 323-A motor equipment for one new steel semi-convertible passenger car mounted on Dupont single-trucks.

Corpus Christi Railway & Light Company, Corpus Christi, Tex., has ordered, through A. W. Burke, Wilmington, Del., eight steel single-track one-man cars from the Southern Car Company.

Ogden, Logan & Idaho Railway, Ogden, Utah, reported in the *ELECTRIC RAILWAY JOURNAL* of June 26 as having ordered six trailers, has awarded this contract to the American Car & Foundry Company. The cars are all-steel and 65 ft. in length.

Eastern Pennsylvania Railways, Pottsville, Pa., is having built by The J. G. Brill Company one all-steel car to be equipped with GE-90 four-motor equipments. The car is designed for experimental operation in both city and inter-urban service.

TRADE NOTES

Frank R. Farnham has joined the staff of Walter B. Snow, publicity engineer and advertising agent, Boston, Mass. Mr. Farnham was at one time with the McGraw Publishing Company.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has received an order for one 6-kw. combination trolley and storage battery gathering locomotive equipped with two No. 904 motors and Nonclad Exide batteries.

Curtain Supply Company, Chicago, Ill., has received orders for Ring No. 48 fixtures and Rex rollers for the ten cars recently ordered by the Wilkes-Barre & Hazleton Railway, Hazleton, Pa., the ten cars ordered by the Lehigh Traction Company, Hazleton, Pa., and also from the Long Island Railroad and Miami (Fla.) Traction Company.

Standard Underground Cable Company, Pittsburgh, Pa., has been awarded a gold medal by the international jury of award, Panama-Pacific International Exposition, for its exhibit of a complete line of electric wires, cables and cable accessories. This is the seventh award of this degree which has been received by this company in as many different expositions.

Western Electric Company, New York, N. Y., has been awarded the following medals by the international jury of award of the Panama-Pacific International Exposition: The Grand Prix for the exhibit as a whole; gold medals, one for telephone switchboards and equipment, another for telephone train dispatching and control apparatus, and a third for insulated wires and cables.

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" headlights, reports a change in the territory of its Southeastern representation. The Walker-Smith Company of Baltimore will now handle the sale of "Golden Glow" headlights in Delaware, Maryland, Virginia and District of Columbia only. New representatives will be appointed for the States of North Carolina, South Carolina, Alabama, Georgia and Florida.

Dayton Fare Recorder Company, Dayton, Ohio, received orders from the Louisville & Interurban Railroad, Louisville, Ky., and the Cleveland & Eastern Traction Company, Cleveland, Ohio, for large installations of its new inter-urban fare recorders, following sixty-day trials of the recorders in service. This manufacturing company has also recently secured contracts for recorder equipments from

the Pearson Engineering Corporation for one of its South American customers; the Erie Railroad, New York & Long Island Traction Company, Pittsburgh Railways, and United Traction Company, Albany, N. Y. The Dayton company is now arranging to install recorders for trial for the Minneapolis & St. Paul Suburban Railroad and the Jamestown, Westfield & Northwestern Railroad, Jamestown, N. Y.

ADVERTISING LITERATURE

Dayton Fare Recorder Company, Dayton, Ohio, has issued a folder describing its various types of fare boxes. Inclosed with the folder is a photographic reproduction of a record card produced on this company's fare box recorder.

Railway & Industrial Engineering Company, Pittsburgh, Pa., has issued a catalog showing the application of Burke horn gap apparatus in connection with a few of its stationary designs of outdoor substations. Views and diagrams in the catalog show these installations as applied to the Wheeling Electric Company, Virginia-Western Power Company, Ohio Electric Railway, Steubenville & East Liverpool Railway & Light Company, Wilmington & Philadelphia Traction Company, Georgia Railway & Power Company, Central Illinois Public Utilities Company.

National Tube Company, Pittsburgh, Pa., has just issued a de luxe catalog of the material manufactured at the Kewanee works of the company. It is entitled "Catalog J" and contains 450 pages, printed in two, and in some places three, colors. An idea of the completeness of the book may be derived from the fact that the index embraces approximately 1800 entries. This material includes "National" pipe for steam, gas, water, and air; cast-iron, malleable-iron, and brass fittings; "Kewanee" unions and "Kewanee" specialties; brass and iron body valves, cocks, etc.

General Electric Company, Schenectady, N. Y., has issued Bulletin No. 47,050, describing this company's line of small plant switchboards made up of standard units in various combinations. The line provides for a great variety of conditions in small plants where panels of simple and inexpensive design are required. They are designed for 125-volt and 250-volt, d. c., two-wire service, for general power and lighting purposes. These units are described and illustrated in detail, various combinations are illustrated, dimensions are given, and panels designated by catalog numbers. The publication contains wiring diagrams and a list of accessories.

United States Steel Corporation, New York, N. Y., has issued in pamphlet form an extended description of its exhibit and those of its subsidiary companies at the Panama-Pacific Exposition at San Francisco. The pamphlet contains a number of illustrations showing the most interesting apparatus shown. Among the exhibits which will attract particular interest of electric railway men are rail sections, special work and electrically-welded joints of the Lorain Steel Company, rolled steel and forged steel wheels, heat-treated axles and steel ties of the Carnegie Steel Company, trolley poles and other tubing and pipes of the National Tube Company, and rail bonds, insulated wire and fencing of the American Steel & Wire Company. Some interesting statistics of the history, output and organization of the United States Steel Corporation are also given in the pamphlet.

NEW PUBLICATION

Shall the Government Own and Operate the Railroads, Telegraph and Telephone Systems? The Negative Side, published by the National Civic Federation, 1 Madison Avenue, New York. Paper, 119 pages; price, 50 cents.

In this pamphlet are contained the papers presented on the negative side of municipal and government ownership of public utilities at the meeting of the National Civic Federation in New York, Dec. 4, 1914. The authors are Prof. Jeremiah W. Jenks, Ex-Senator Jonathan Bourne, Jr., F. G. R. Gordon, and James W. Sullivan. A report of this meeting and abstracts of the papers were published in the *ELECTRIC RAILWAY JOURNAL* at the time, but the complete papers should be helpful to all who are interested in this very live subject. The extended experience of all the authors enables them to speak with authority and to marshal facts which are convincing.

No. 2

LOSING TIME IN TERMINALS

On many large railroad systems it is often most difficult for a company to avoid losing time in terminal approaches, on account of the magnitude of traffic, with its great diversity of origin concentrated upon a limited trackage. In interurban electric railway practice, street traffic often reduces schedule speed unduly in the last stages of a journey, but this also cannot be helped in a good many instances. What can be helped, however, is unnecessary delay in entering terminals in smaller places where ample room in the streets is available, or where the trackage conditions are favorable to good service. Sometimes the construction of a short section of double track in a terminal city of moderate size is of great value in enabling in-bound and out-bound interurban cars to make fast time without waiting to pass slow-moving locals, whether the latter are on or off schedule. Again, by avoiding stops considerably in advance of the destination to read registers, adjust running boards or other details which may better be handled at the end of the route, time may be clipped off the total run, with the resulting improvement in the schedule.

JUDGING HUMAN NATURE IN LEGAL DEPARTMENT

In a paper at the Pacific Claim Agents' Association, reported in the last issue, C. F. Young, adjuster Puget Sound Traction, Light & Power Company, emphasized the necessity on the part of the claim investigator of ability to combine tact with firmness. The same principle applies very appropriately to another field of the legal department, that of the attorney engaged in hastening the vacating by owners of property legally condemned for a new right-of-way. The necessity for handling different types of people in totally different manners was shown recently by a certain lawyer's personal experience in such work in an important Eastern city. With some owners a polite explanation of the situation which legalized the condemnation of property was sufficient to carry conviction of the railway company's authority to take possession and honesty of intention to settle fairly, but with the more ignorant landowners it was found that a tone of politeness was often mistaken for suavity as a veil for unscrupulous motives. Continued politeness only served to excite their suspicions, and cause them to classify the attorney and his company among the members of the Jack Sheppard Club. Experience taught that an answer of unmistakable sternness to such resentful utterances had the effect of immediately quieting both the objections and suspicions of the property owners. Severity and firmness in this case encouraged respect and thus saved much

time that otherwise would have been wasted in unnecessary wrangling. The firm grasp took the sting out of the nettle.

MINIMUM CAR WEIGHTS FOR CLASP BRAKES

The report on clasp brakes made by a Master Car Builders' committee some weeks ago at Atlantic City constituted a very satisfactory indorsement of the device on the basis of experience obtained to date. There was, however, one feature of the report that serves also as an excellent argument for the use of the semicircular brass, at least by electric railways, in preference to the clasp brake as a means for eliminating the hot boxes due to journals that shift out from beneath their brasses under emergency applications. This was the establishment by the committee of a minimum car weight for clasp brakes, it being recommended only that cars weighing more than 96,000 lb. should be provided with them, and as there are very few electric railway cars whose weights even approach this figure the average interurban car, on the M.C.B. basis, would seem to be exempt from the necessity for clasp brakes. Undoubtedly, the establishment of this minimum weight was on the grounds of expense, the limit of 12,000 lb. per wheel being set by the prohibitive pressures per shoe involved with standard rigging for the higher wheel loads rather than by any doubt in the value of the clasp brake for lighter cars. Of course, it has been demonstrated that the shifting of journals depends upon the percentage of braking pressure and not upon the actual weight on the wheel, and if clasp brakes are going to be considered too expensive for ordinary cars the only apparent alternative is the use of the semicircular brass if the journals are to be kept in place.

RIVETING WITH STEEL PRESSINGS

An objection to steel pressings as opposed to castings has recently been raised on the ground of the necessity for riveting on lugs, fixtures and the like instead of having them cast integral with the original piece. Apparently the major part of the complaint is based on experience with riveted joints that have worked loose, and it cannot be denied that this has been far from uncommon in electric railway work in the past. It is also true, however, that much of the riveting work that is done in electric railway repair shops is by no means up to the best standards, and it is hardly proper to condemn the process in general because of failures that could undoubtedly have been avoided by proper care in fabrication. Riveting, when properly done, is infinitely superior to any other method of making up

a joint, and so far as reliability in attaching lugs is concerned it gives results quite as good as those obtained by pouring the projections solid on a steel casting and better than those obtained when cast iron is used. As compared with welding the riveted joint is distinctly preferable because it can be separated and remade at the expense only of cutting off the rivet heads and re-driving them as desired, yet when once in place the strength of the construction is definitely known and does not depend, as does the weld, upon a complicated metallurgical process and a granular structure of the affected metal that is absolutely hidden from sight. All that is required is that the riveted pieces shall be firmly clamped together and that the rivet holes shall be rough-reamed before the rivet is driven. A high grade of rivet steel and the use of pressure riveters are largely incidental. Years of experience with locomotive boilers have shown this beyond a doubt, because there the riveted attachments never give the slightest trouble notwithstanding the continuous vibration and extraordinary strains set up by the wide temperature changes.

LIBERALITY WITH COST DATA

It is a pleasure to commend the American Institute of Electrical Engineers and the railroads which co-operated for their respective enterprise and liberality which made possible the publication of data of costs of construction and operation of different types of contact systems. This was a unique feature of the Deer Park convention, one which was the cause of surprise as well as congratulation. Even assuming the necessary willingness on the part of the possessors of the valuable data, the reduction of the information to form for comparison was no light task. One writer of a paper based his conclusions on entries filling 250 foolscap pages, the figures being drawn direct from the railroad company's job records and requiring an analysis of these. Another element in the success of the program laid out by the railway committee of the institute was its definiteness. The study was confined to one part of the field, contact systems. In this restricted region attention was focused upon the particular things likely to interest and prove of value to railway men. The result speaks for itself. The lesson in it all seems to be that the old policy of hoarding cost data by railroads is on the wane. Electric railways are committed to the policy of publicity and, like charity, this should begin at home. They must serve each other as well as the public, and one effective way to do this is through the interchange of information which will lead to more economical construction and maintenance. The pocket notebook of many a master mechanic and engineer contains information whose value would be enhanced by circulation, for such circulation would stimulate others to like liberality. An example of the kind of information which is of great value to operating men was printed in the issue of the *ELECTRIC RAILWAY JOURNAL* for June 26, page 1214. By giving these figures the Los Angeles Railway Corporation shows a real willingness to serve. By the dis-

semination of such data the industry benefits, and the giver is in no wise impoverished.

CONSTRUCTING STEEL TOWER LINES

A group of papers presented at the recent A. I. E. E. convention dealt with the very important matter of the construction of tower lines. One may at the present time say that the steel tower on about 500-ft. or 600-ft. spacing has become the standard construction for high-voltage transmission lines. At first towers were very crude in design and generally erred either on the side of insufficient strength or of being made abnormally heavy in the attempt at improvement. As things stand to-day there are available steel towers which have been really designed for the purposes for which they are to be used, and the old difficulties have for the most part disappeared. Yet it is perfectly certain from the performance of tower lines that there is a good deal to be learned yet about economical design and construction. The convention papers to which we have reference deal in the main with one important and rather neglected consideration, that is, the foundations of the towers. Whether the tower itself is designed to be a rigid structure or to have a considerable degree of flexibility, as in some of the A-frame structures, the working strains come ultimately upon the foundation.

It is not difficult to design beforehand a tower sufficiently strong to stand the maximum stresses imposed upon it without buckling. This does not, however, insure it against tipping over or against being forced into a position where the added load may cause actual failure. The tower is meant to do its work when standing erect and in its normal position, and if pulled out of it through lack of foundations it may absolutely tip over or be twisted out of shape. The foundation work consists essentially in bolting the base of the tower to anchors of one sort or another sufficiently embedded in the ground to resist the turning moment of the base. In the papers before us two forms of foundation are chiefly considered: Steel anchors, usually of tripod form, so embedded that they will not pull out, and concrete masses of the general form of an inverted mushroom with embedded bolts or angle irons to which the steel structure is secured. As between these two types the choice seems to be chiefly based on the local conditions. Either can be made adequately strong to hold up the tower under all practical conditions. It has been actually shown that in some cases one form is cheaper and in other cases the other, each in its own situation being adequately strong. On the lines of the Pennsylvania Water & Power Company it was found that the mushroom concrete foundation could be installed more rapidly and at lower cost than the steel used on the first tower line of the company. On lines elsewhere the reverse situation has occurred.

The moral of the discussion seems to be that with any given tower the best form of foundation must be determined for the situation in which the tower is to be used, irrespective of experience elsewhere. The nature of the ground, the cost of labor, the cost of

concrete, and transportation all play their part, and the indications are that it is wise before settling so important a question actually to try out the towers to be used under the stresses for which they are designed and with several types of foundation. The cost of such experimentation is small compared with the difference in final expenditure which can thus be determined. There seems to be no advantage in pushing such tests to the limit of breaking down the tower. It may be theoretically interesting to know whether with a given foundation the foundation itself will break or lift or the tower crumple under extraordinary stresses. The practical demand is merely whether the foundation is fully adequate to endure the stresses incurred when the tower is loaded to the designed point, with due regard to a proper factor of safety.

LINE INSULATION

Mr. Bang's institute paper on the operation of the transmission lines from the great plant on the Susquehanna into Baltimore, originally presented in Baltimore and brought up for discussion at the convention last week, brings to the front the ever-present insulation problem. The three circuits of aluminum cable which form this transmission system have apparently conditions not unfavorable to continuity of service. They are carried on steel towers provided with grounded cables for protection against lightning, are worked at a voltage which cannot be considered exceptionally high, and are supported on suspension insulators having a large factor of safety, much larger than is found on similar circuits using pin-type insulators. Nevertheless the partial or complete interruptions of service have averaged more than a score per year, and of this number the vast majority have been due to lightning, although the lines are protected not only by the ground wires but by electrolytic arresters which, on the whole, are perhaps the most satisfactory form of arresters yet produced. Lightning is, of course, a contingency to be treated as always dangerous, especially when a direct stroke falls upon the line. Generally the arresters at the ends of the line are sufficient to keep the discharge from doing damage in the station, although now and then there are failures.

The damage on the line, however, is a different matter for it is strictly local. Hence the presence of arresters somewhere else on the circuit makes very little difference so far as damage to insulators is concerned. The situation seems to have been, on the circuits which Mr. Bang studied, that a powerful lightning discharge frequently flashed up alongside the string of insulators to the tower and broke down insulation, sometimes shattering the insulator disks in a startling fashion. The following arc did the rest. With all the insulators in first-class shape the power of the series to resist the lightning flash ought to have been considerable enough to avert damage, but it frequently failed to do so. A direct lightning stroke falling upon the line has so enormous a potential that a flash-over is not at all unexpected. In the case of this line, however, it may be

questioned whether some of the destructive strokes were not due to gradually lessening strength of the insulators, caused by continued use and mechanical and electrical strains. Mr. Bang's investigation of the insulators by periodical resistance tests shows a somewhat disquieting state of affairs. Normally they were in first-class condition, but about one disk in seven or eight, after several years' service, showed a very great falling off of the resistance, practically rendering the injured disk useless. This was traced to two different causes, first superficial cracks, usually on the head of the disk, apparently developed from mechanical strains internal or external, and, second, failure of insulation, again usually at the head of the disk, not through cracking, but through a slight porosity of the porcelain, the effects of which seem to be cumulative with long exposure to moisture.

The moral appears to be that in the present state of affairs it is wise to make megohm tests of insulators from time to time to see whether any of them have become unreliable. Whether a similar condition holds for the pin-type insulators, more frequently used than the suspension insulators for the comparatively moderate voltages of railway transmission, remains to be seen. The situation as regards strains is quite different in the two forms, and at the commoner voltages also comes in the difference between glass and porcelain with respect to this particular kind of deterioration. Most lines use porcelain insulators, but in a great many cases glass is an effective substitute, and the relative reliability of the two materials as respects the progressive decrease in insulation deserves attention.

The most suggestive portion of Mr. Bang's paper deals with preventive measures to avert the damage following the lightning stroke. The real mischief is done by the arc which follows a breakdown of the insulation, and two devices tried seem to have proved effective in putting this arc out of business before the insulation was permanently destroyed. Both are described as in use here, and they have seemed to give promise of filling a very important function in line protection. One is a relay device for shunting the arc with a fuse as soon as it is established, thereby killing it, and then clearing the line by the destruction of the fuse. The other drops the excitation of the machines until the arc gives out and then re-establishes the field. The former can be made to act very quickly so that there is little risk of either damage to lines or of losing synchronous load. The latter operates more slowly but appears from Mr. Bang's results to be somewhat more certain in its operation. A combination of the two as worked out on the lines under discussion seems to have been very useful in lessening the trouble from lightning since these protective devices were installed. At all events it is clear that the insulators on a high-voltage line do require more watching than mere attention to physical breaks, and that protective apparatus properly installed is of material value in preventing interruptions of service even though the lightning may start trouble.

Shop Notes from Hampton, Va.

An Account Is Given of the Practices in Economical Management and Good Housekeeping at the Hampton Shops—Some Novel Features Are Described

In a recent visit to the Hampton shops of the Newport News & Hampton Railway, Gas & Electric Company, the following practices in economical management and good housekeeping were observed:

PAINTER'S STORAGE RACK OF ADJUSTABLE TYPE

The painter's storage rack shown in an accompanying half-tone is not an absolute novelty, but its principle deserves to be more widely known than it is. So far as the horizontal placing of panels is concerned, the rack does not differ from that seen in most paint shops. However, with the aid of ordinary door latches, the vertical partitions may be moved to accommodate any width of panel. The latches are mounted vertically at the top and bottom of each partition and their tongues are merely drawn out of pockets in the top and bottom of the rack to permit the shifting of the partitions to any desired stops to the right or left.

VERTICAL ARMATURE RACKS

Where room is scarce vertical armature racks deserve wider use. In the accompanying illustration may be seen one for motor armatures and another for compressor armatures. The armatures are quickly handled by means of a jib crane which is attached to a corner post, a crane being used because the shop is too small to require an overhead track. Formerly the armatures were stored on a table under canvas. This led to trouble because careless workmen would throw heavy tools on the canvas, thereby damaging commutator bars which previously had been passed as perfect.

FIRE PAIL SUSPENSION

It is customary in many shops to carry the egg-bottomed fire pails through holes made for them in a solid wooden shelf. This shelf offers the shopmen a tempting place for so many odds and ends that eventually the pails themselves are lost to sight. Following a suggestion from the safety committee, all fire pails hereafter

will be carried from metal brackets so that the space between and on the pails will not be cluttered up so easily. The two illustrations on the next page show one of the old wooden shelves and the other the new metal bracket.

RECLAIMING TWO-POINT RESISTORS

The company has already reclaimed some fifteen sets of Westinghouse two-point resistors which had been rendered useless by the corrosion of the two-screw brass

HAMPTON SHOPS—VERTICAL ARMATURE RACKS WITH JIB CRANE

lugs or contacts. After brightening the contact surfaces of the grids the old lugs were replaced by copper washers of the type used on the latest Westinghouse resistors.

ELECTRIC ARC WELDER

Out of five old resistors, the abandoned rheostat of a substation voltage regulator and a circuit breaker the

HAMPTON SHOPS—PAINTERS' RACKS WITH MOVABLE PARTITIONS

HAMPTON SHOPS—HOME-MADE WELDING OUTFIT IN USE ON A MOTOR SHELL

HAMPTON SHOPS—THE SAFE AND CLEAN WAY OF SUSPENDING FIRE PAILS

shopmen constructed the electric arc welder illustrated. This equipment is mounted on a truck for convenience in working outside as well as inside the shops. The welding material is mild steel in the form of 5-16-in. diameter rods, and the flux is a cheap borax compound. The welding rods are held in a plug of metal bored for the purpose. The welder's metal hood has the usual combination of ruby and green lenses. The novel feature of the hood is that its weight is comfortably carried by building it around a cap made up of an ancient, rimless derby. The cap has a leather band to which brackets from the hood are attached.

One of the first jobs to which this welder was applied was the building up of No. 27-G truck side-frame brackets. It has also been used for patching gear cases and filling keyways and it will shortly be tried for building up trackwork.

CHANGE OF GEAR RATIO

The gear ratio of many equipments was 24:58, which corresponded to a maximum speed of 35 m.p.h. A careful study of running conditions showed that the

HAMPTON SHOPS—A DERBY ANCIENT OF DAYS ADAPTED TO CARRY THE VISOR WITH EASE

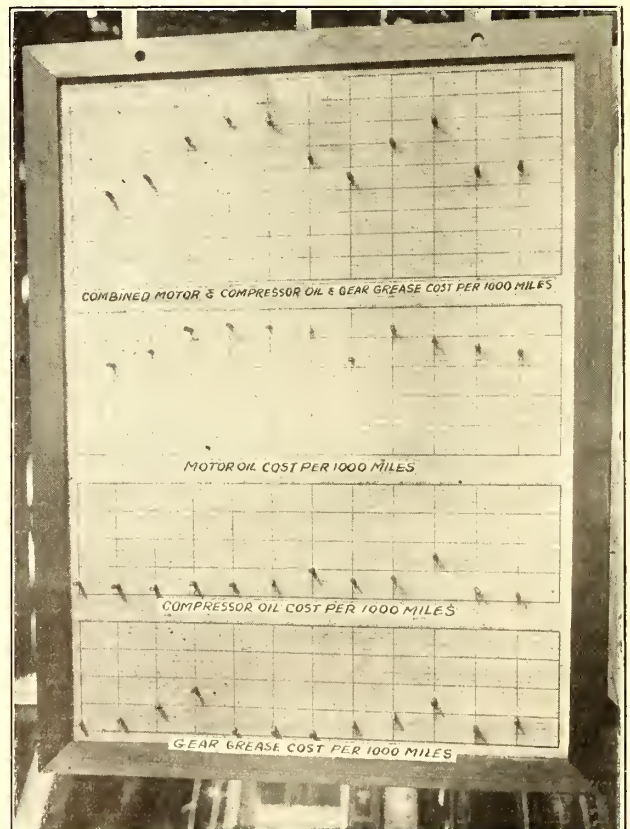

HAMPTON SHOPS—THE UNSAFE AND NEGLIGENT WAY OF SUSPENDING FIRE PAILS

schedule could be maintained even if the maximum speed was cut to 28 m.p.h. The standard ratio is now 17:67. The saving in energy consumption has not been calculated, but there has been a very perceptible decrease in the number of baked armatures and fields. The company has also changed from bolted gears to the Cincinnati Tool Steel Gear & Pinion Company's solid gear.

MAINTENANCE RECORDS

Until the property was taken over in January, 1912, by Allen & Peck, Inc., with J. N. Shannahan as general

HAMPTON SHOPS—PEG BOARD POSTED IN SHOP TO SHOW MAINTENANCE COSTS

manager, no records of equipment life were kept, nor were the cars inspected and overhauled on a mileage basis. At present they are inspected every six days, which is approximately on a 1000-mile basis. Beginning March 15 all cars were put on an actual 1000-mile inspection basis. Mileage records are now kept showing actual service obtained from brakeshoes, wheels, trolley wheels, harps, lubricant costs, etc.

A keen desire to keep down the lubrication costs has been created by showing the men just how the cost of each item varies from month to month and how this affects the total cost. To secure this publicity a wooden frame was constructed to hold a record sheet which is ruled vertically for months and horizontally for cents per 1000 car-miles. This sheet is subdivided to show the costs of motor oil, compressor oil, gear grease, and also of these three items combined. As shopmen are not accustomed to reading graphs the points which would serve to draw each curve are represented by plugs of wood. When a year's record has been made in this way the curves will be drawn and the plugs used again to show the monthly records for the current year.

The cost of car lubrication has already been cut down from 42 cents in 1912-1913 to 24 cents per 1000 car-miles, exclusive of packing, but it is expected that during the present year the cost will be brought down to the Galena contract figure of 20 cents per 1000 car-miles. It will be difficult to drop below that figure so long as 25 per cent of the mileage is performed with such motors as the Nos. 49 and 12a. These older motors must be lubricated every day and their felt-pad lubrication through Perfection packing, while satisfactory for service, is uneconomical because of stand-by leakage. In fact, with these motors the oil consumption is almost as great when the cars are standing as when the cars are moving.

Milwaukee Fare Case Decided

Supreme Court of the United States Says That the City Under Existing Statutes Had No Power to Make a Contract Covering Rates

A short note was published on page 1226 of the issue of this paper for June 26 in regard to the decision of the Supreme Court of the United States in the Milwaukee fare case. The principal question involved in the decision was whether the city of Milwaukee had power to make a contract with the railway company covering a term of years for a specified rate of fare. The opinion, which was handed down on June 14, upholds the Wisconsin Supreme Court in denying this right.

The opinion first recites the history of this case, which was briefly as follows: On Jan. 2, 1900, there was granted by the city to The Milwaukee Electric Railway & Light Company the right to operate over certain streets. By the same ordinance all franchises expiring prior to Dec. 31, 1934, were extended to that date and all franchises which would otherwise expire subsequently to that date were made to terminate at that time. The ordinance permitted the company to charge a 5-cent fare when paid in cash but required it to sell twenty-five tickets for \$1 or six tickets for 25 cents good at certain hours up to Jan. 1, 1905, and thereafter good at any time. Subsequently, at the request of the city, the Railroad Commission held hearings to determine whether the rates were too high and finally ordered the company to sell thirteen tickets for 50 cents. The company claimed that this order took its property without due process of law. The case was first tried in the State courts and the order was sustained by the Supreme Court of Wisconsin. It was then taken by the company

to the United States Supreme Court as being a violation of Sec. 10 of Art. I of the Constitution of the United States and of the fourteenth amendment thereto.

In its decision the federal Supreme Court upholds the Wisconsin Supreme Court in its decision that the city had no authority to make such a contract and that the authority to establish fares remained with the State. As a basis for this conclusion it quoted Sec. 1862 of the revised statutes of Wisconsin of 1860 which reads in part as follows: "Any municipal corporation or county may grant to any such [street railway] corporation * * * the right to construct, maintain and operate street railways, the use, upon certain terms as the proper authorities shall determine, of any street, parkway or bridges * * *. Every such road shall be * * * subject to such reasonable regular rules * * * as the proper municipal authorities may by ordinance from time to time prescribe."

The opinion then says: "The fixing of rates which may be charged by public service corporations of the character here involved is a legislative function of the State, and while the right to make contracts which shall prevent the State during a given period from exercising this important power has been recognized and approved by judicial decisions, it has been uniformly held in this court that the renunciation of a sovereign right of this character must be evidenced by terms so clear and unequivocal as to permit of no doubt as to their proper construction." The principle involved is well stated, according to the court, in *Home Telephone Company vs. Los Angeles*, 211 U. S. 265, 273.

Continuing, the court says that the Supreme Court of Wisconsin held that Sec. 1862 quoted above gave no distinct authority to the city to contract away the legislative authority of the State to fix tolls and fares by lowering them if found to be excessive; that while the term "grant" was used, the grant was to be upon terms such as the municipal authorities might determine, and that this language was more appropriate to the exercise of power by the municipality than to the making of a contract between parties. The Supreme Court of the United States adds: "The language of the section certainly lends itself to this construction, and there is nothing in specific terms conferring the right to contract by agreement between parties, much less to make such contract during its existence exclusive of any further right of the State to act upon the subject in the exercise of its legislative authority. It authorizes the grant of the use of the streets upon such terms as the proper authorities shall determine, not upon such terms as the parties in interest shall agree to."

The Supreme Court says that the plaintiff relied upon *Detroit vs. Detroit Citizens' Street Railway Company*, 184 U. S. 368; *Cleveland vs. Cleveland Street Railway Company*, 194 U. S. 517, and *Minneapolis vs. Minneapolis Street Railway Company*, 215 U. S. 417, but it finds a material difference in circumstances concerned in this case and in the cases in question.

The opinion continues: "It is true that this court has repeatedly held that the discharge of the duty imposed upon it by the Constitution to make effectual the provision that no State shall pass any law impairing the obligation of a contract, requires this court to determine for itself whether there is a contract, and the extent of its binding obligation, and parties are not concluded in these respects by the determination and decisions of the courts of the States. While this is so, it has been frequently held that where a statute of a State is alleged to create or authorize a contract inviolable by subsequent legislation of the State, in determining its meaning much consideration is given to the decisions of the highest court of the State. Among other cases which have asserted this principle are: *Freeport Water Company vs.*

Freeport, 180 U. S. 587, and Vicksburg vs. Vicksburg Water Company, 206 U. S. 496, 509."

The court then discusses the Wisconsin decisions on this point quoted by both sides, particularly *Linden Land Company vs. The Milwaukee Electric Railway & Light Company*, 107 Wisconsin 493, and *Manitowoc vs. Manitowoc & N. T. Company*, 145 Wisconsin 13, and agrees with the Wisconsin Supreme Court in holding the latter to be controlling and that Sec. 1862 denies authority to municipal corporations to make contracts preventing the State from its further exercise of its power to fix the rates which may be charged by public service corporations.

As stated in the issue of this paper for June 26 The Milwaukee Electric Railway & Light Company now proposes to take the matter up with the lower courts, and possibly also with the Railroad Commission, on the question of the reasonableness of the original order, and hopes to win its case.

Cost of Highway Bridges*

Apportionment Between Street Railways and Cities—Four Conclusions Upon Which the Determination of the Proper Settlement Should Be Based

BY CHARLES M. SPOFFORD OF FAY, SPOFFORD & THORNDYKE, BOSTON, MASS.

The fact that trolley cars are so much heavier than other road vehicles puts street railway companies under different obligations than other users of highway bridges and makes it seem fair to assess upon them the extra expense required to provide for traffic of this character. The assessment of street railways to pay for the cost of new bridges in Massachusetts has been established by legislative enactment and has varied from a minimum of 10 per cent to a maximum of 25 per cent, the cost being determined by hearings before a commission appointed by the court.

If the structure is to be of a monumental type, it would seem that the scale of the towers, carving and other ornamental features may be a function of the width of the bridge, and if increased width is necessary to provide for street car traffic, additional expense for this purpose may legitimately be incurred.

Whether any material increase in width is necessary to provide for street car traffic depends upon the total density of the traffic. If the car service is infrequent, there would seem to be no reason for increasing the width of the bridge to provide for street cars other than by the slight amount necessary to provide safe clearance for crowded cars. Ordinary traffic can readily run on the portion of the bridge occupied by the track with little or no delay, and space for extra lines of traffic need not be provided. An example illustrating such a case is the Meridian Street Bridge of Boston, where it was agreed that the proper distance center to center of trusses would be increased only 2 ft. 6 in. by the presence of street cars, although it carries two lines of track.

Another example illustrating the same case is the Chelsea North Bridge of Boston. Provision for four lines of traffic was evidently necessary on this bridge, but it was agreed by both sides before presentation to the Apportionment Commission, that a roadway 40 ft. wide between curbs, with trusses 44 ft. center to center, was required whether street cars were operated or not, this space providing for four traffic lines. In consequence, no charge was made to the railroad for additional width.

To measure the capacity of a bridge or street in re-

lation to traffic, it is evidently necessary to consider the character of the vehicles and their speed as well as their number. For this purpose the London Board of Trade sets up as a unit a motor cab or carriage, and assigns the following numbers to other classes of vehicles, using the unit as one.

Trade Vehicles	Passenger Vehicles
One-horse (fast)..... 3	Electric trams10
One-horse (slow)..... 7	Omnibuses (horse)..... 5
Two-horse (fast)..... 4	Omnibuses (motor)..... 3
Two-horse (slow).....10	Cabs (horse)..... 2
Motor (fast)..... 2	Cabs (motor)..... 1
Motor (slow)..... 5	Carriages (horse)..... 2
Barrows 6	Carriages (motor)..... 1
	Cycles½

The board lays down the following definitions: "Traffic volume" is the average aggregate number of traffic units attributable to vehicles which pass a given point per minute during the twelve hours from 8 a. m. to 8 p. m. "Average traffic density" is the aggregate number of traffic units attributable to vehicles which pass the point during the twelve hours, per minute, per 10 ft. of available carriageway. "Greatest traffic density" is the average density per minute, per 10 ft. of available carriageway, during the busiest hour, expressed in traffic units. With the above units and definitions in mind, the following comparison of traffic on London bridges is clear:

	Westminster Bridge	Waterloo Bridge	Blackfriars Bridge	London Bridge	Tower Bridge
Traffic volume	91.4	60.5	105.9	89.2	84.7
Average traffic density, ...	20.3	22.0	14.4	24.1	24.2
Hour of greatest density, ...	6 to 7	5 to 6	6 to 7	11 to 12	11 to 12
Density of that hour.....	23.8	22.5	15.3	27.4	27.9
Average vehicles	4.2	3.9	5.0	4.0	6.0

In connection with the width of bridges it should be remembered that the capacity of a bridge in vehicles per hour is considerably greater than that of the ordinary city street due to the freedom from interruption by traffic on intersecting streets and by vehicles stopping at the curb to discharge and receive freight or passengers. It is evident that the width of bridges on curves may have to be increased greatly to provide proper clearance for street cars.

The increase in strength necessary to provide for street cars is most marked in the floor systems. It is less noticeable in trusses and girders, and least of all in foundations. The allowance for impact and future increase of street car loads must be carefully considered in determining the additional strength of the structure, but so far as the foundations are concerned, it is doubtful if any allowance for impact need be made.

The best plan to pursue in determining the difference in cost of bridges with and without street cars seems to the writer to be that of comparing the necessary sizes of main members in the two designs. Allowance for the weight of the details of the second structure may be made by considering the details of each individual member to vary in weight in proportion to the variation in the cross-section of the main member. If the structure has been completed, the weight of details may be established by the gross shipping weights reduced by the computed weight of the main sections.

In the case of a reinforced concrete barrel arch bridge, it would seem as if the additional cost would ordinarily be dependent entirely upon the increased width. The cost of engineering, insurance, etc., may be assumed to vary directly with the cost of construction.

The fact that the cost of maintenance and operation of a highway bridge would ordinarily be borne by the municipality should be considered in apportioning the cost to the street railway. This would be particularly

*Abstract of paper presented before Western Society of Engineers, Chicago, on May 10, 1915.

pertinent in the case of swing bridges, where it would seem as if a fair arrangement would be for the railway to furnish the current necessary to open and close the bridge, and for the municipality to maintain the draw tenders and other attendants. In general, it would appear that the street railway might reasonably be charged, as its portion of the capitalized cost of maintenance, a share proportionate to its contribution to the cost of construction.

All of the above discussion should be considered with due regard to the fact that the railway is ordinarily subject to heavy taxes, and in consequence should be entitled to operate without charge across the bridge with vehicles of weight equal to that of the heaviest motor trucks. The only equity in charging the railway more than the ordinary transportation company is because of the heavy loads which it operates.

The conclusions which the writer has drawn from his experience in apportionment cases of this character are as follows:

1. Additional width to provide for street cars is ordinarily necessary only in the case of bridges with narrow roadways, providing for no more than two lines of traffic.

2. The extra expense involved in strengthening heavy city bridges of permanent type to provide for 50-ton trolley cars would not ordinarily be greater than 10 per cent of the total cost, and may be as low as 6 per cent. This percentage will be greater for light country highway bridges without paved floors, but if such bridges are designed for heavy motor-truck traffic, as they should be, the additional expense will not be excessive.

3. To apportion the cost equitably and with credit to the engineering profession, the engineers on the two sides should try to agree upon the additional cost of provision for street cars before the case is presented to an apportionment commission.

4. It is doubtful if the railway should ordinarily be charged for additional convenience due to the reconstructed bridge. This, however, is a matter the settlement of which hardly comes into the province of the engineer.

Jitney Statistics at Fort Worth

Even on the Best-Traveled Route, Over Which Jitneys Were Operated Seventeen Hours a Day, Very Unfavorable Conditions Are Shown

On March 25 the Northern Texas Traction Company made a detailed check of the jitney business on a day of heavy travel. From the figures so obtained tables and a series of corresponding graphs were reproduced.

An assembly of data covering the jitney operation on all Fort Worth lines, hour by hour from 6 a. m. to 12 midnight, showed that the average passengers per trip on the nine divisions ranged from 1.9 to 2.54. The total number of trips made was 7498, the number of passengers carried, 16,661, the average passengers per trip 2.22 and the gross income of 217 cars \$833.70.

The travel in opposite directions during any given hour showed marked differences, empty trips being numerous. One line, however, was somewhat exceptional in having a fairly even traffic both ways during business hours. The noon-hour traffic was about half that of the peaks on most of the lines.

Among the individual cars on a typical line, which although the longest in the city is also the best-traveled, the highest gross earnings shown were \$8.30. But in order to take in this amount the car was operated for seventeen hours, and this necessarily implies the employment of two drivers sooner or later. The gross

earnings per mile ranged from 2.5 cents to 3.7 cents. The earnings per hour ranged from 26 cents to 51 cents. The schedule speed averaged about 12 m.p.h., this exceeding the Fort Worth cars by about 50 per cent, but one car made only 7.8 m.p.h. and another 9 m.p.h. The maximum schedule speed was 14.8 m.p.h.

It may be added that in the case of the line in question the maximum run of the jitney is only 3.7 miles long. Even this distance is in excess of the usual jitney ride in other cities, and this is reflected in the condition that the recorded earnings per hour are also somewhat less than usual.

The set of graphs shown in the accompanying cut relates to this line also. In these a comparison is made of jitney versus street railway traffic, also on an hourly basis. The trips per hour made by the street cars are not shown. They amount to four trips each way, during normal hours and from eight to twelve each way during rush hours. The seating capacity of a car on this line is forty, or ten times that of the average jitney.

One unusual feature of jitney operation at Fort Worth is that it was inaugurated by a company which began operation on Jan. 11 with thirty cars. This company has endeavored to keep to certain routes, but modi-

JITNEY STATISTICS—GRAPHICAL REPRESENTATIONS OF COMPARATIVE STREET CAR AND JITNEY TRAFFIC

fications have been made from time to time because of inroads from free-lance jitneys. A check of all the cars operated by this company as made on a given date showed that the maximum gross earnings of any one car were \$9.50. This must have included the wages of two men as the car was operated sixteen hours and forty-five minutes. The earnings per mile of this car were only 4 cents. The best figure for any car, 4.2 cents, was made by one which ran for twelve hours and thirty minutes, therefore omitting the leanest traffic hours. The average gross for all cars was but 3.37 cents, barely enough to cover depreciation, fuel and maintenance, let alone wages.

The Texas Power & Light Company on July 1 began to serve power to all Texas Traction Company lines. In the past the railway operated its own power plants, but recently a company was organized to take over the light and power plants.

Electric Railway Session at A. I. E. E. Convention

At the Deer Park Convention One Session Was Devoted to Heavy Electric Traction Contact Systems—
Abstracts of the Papers Presented and the Resulting Discussion Are Given

The Thursday morning session of the thirty-second annual convention of the American Institute of Electrical Engineers, which was held at Deer Park, Md., from June 29 to July 2, was devoted to a discussion of the construction and operation of overhead and third-rail contact systems with particular reference to costs. In these papers the practice of some of the most important electrified roads was described and the writers very frankly told of the difficulties which had been met and overcome. The salient features of these papers and of the resulting discussion are covered in the following abstracts.

TOP-CONTACT UNPROTECTED RAILS FOR 600-VOLT TRACTION SYSTEM

Charles H. Jones, assistant electrical engineer Metropolitan West Side Elevated Railroad of Chicago, discussed the various factors which enter into the construction, operation and maintenance of top-contact unprotected rail upon which the gravity type of collecting device was used. He took up the subject under the following subdivisions: weight of rail, quality of rail, insulating and supporting, bonding and jointing, anchoring, special work required, method of connecting at crossings and cost of installation and maintenance.

For rails weighing less than 80 lb. per yard, there is nothing to be gained by the use of high-conductivity rail, which is more expensive and is more difficult to handle than the hard rail, being softer and therefore more easily kinked during installation. There is no appreciable difference in the rate of wear between low-carbon and ordinary steel in the class of service covered in the paper. With light rail it is better to get increased conductance by using a larger cross-section rather than a softer steel. With heavier rail, if by the use of higher conductivity the expense of a paralleling feeder system can be avoided, the high-conductivity rail should be used. On the other hand there is a certain amount of intangible gain to be secured by having a paralleling feeder system, especially with the narrow working margin that is assumed when the difference in conductivity would decide the question of whether or not a paralleling feeder system would be required.

Insulation of a contact rail for a 600-volt system is more mechanical than electrical. Wherever there is any vibration, porcelain and reconstructed granite, or insulators having castings bolted together have not been satisfactory. Mr. Jones stated that a type of insulator consisting of a circular socket base with flange for bolting to the tie, a cylinder of impregnated

CONTACT SYSTEMS—THIRD-RAIL INSULATOR, ANCHOR INSULATOR AND ATTACHMENT, AND EXPANSION JOINT, RECOMMENDED BY MR. JONES

Referring to the tendency to use heavier contact rail, he stated that the advantage to be gained by the use of heavy rail lies in the fact that a large conductance can be secured for about the same amount of labor charge as that required to install lighter rails which can serve as contact members only. If a paralleling feeder system is required a medium weight of rail, say from 80 lb. to 100 lb., will give more satisfactory results. With heavy rails, the advisability of using a special section should be considered for the purpose of throwing more metal into the contact surface and thereby increasing the life. For weights of rail up to and including 80 lb., the standard A. S. C. E. section is satisfactory. As far as the wear is concerned, Mr. Jones gave data to show that contact rail will last twenty years or more.

wood set in the socket, and a circular top casting with a slot on the top to accommodate the base of the rail, a petticoat to shed moisture and a pair of clamps to keep the rail from jumping out of the slot without binding it had proved very satisfactory. The base casting is the same for all weights of rail. The life of an insulator is from ten to twelve years under ordinary conditions, although impregnated-wood insulators have been known to last from fifteen to twenty years.

The third-rail is cut up into sections of from 1000 ft. to 1200 ft. for anchoring purposes and these are anchored at the center. On surface track not provided with a wooden guard rail the conductor rail may be anchored by attaching several strain insulators in multiple to an iron plate which extends over, and is bolted to several ties, the other end of the insulators being

fastened to the base of the contact rail. If wooden guard rail is used, an anchor block consisting of a piece of 6-in. x 8-in. oak 2 ft. long, impregnated with preservative, can be attached to the guard rail, and the contact rail in turn can be bolted to the block. Porcelain insulators may be placed between this block and the guard rail. The best method of providing an expansion gap in the conductor rail is to end a run of rail with an incline leaving a 3-ft. space between stretches. A continuous expansion joint is shown on the preceding page.

Mr. Jones gave the cost of third-rail construction, using 80-lb. T-rail in 60-ft. lengths, as \$3,662 per mile for labor and material, of which the labor is somewhat less than 10 per cent. An additional 10 per cent is allowed for engineering and supervision, making a total of \$4,028 per mile. For a 50-lb. rail, in 30-ft. lengths, the cost is \$3,284 per mile. At an average cost of \$80 per mile per year the contact rail can be kept in first-class condition and the insulation changed every twelve years. This, however, does not include complete renewal of rails, plates and bonds, such as will occur when the rail is completely worn out.

OVERHEAD CONTACT SYSTEMS, CONSTRUCTION AND COSTS

Under the above title E. J. Amberg, engineer McHenry & Murray, New Haven, Conn., and F. Zogbaum, engineer of maintenance New York, Westchester & Boston Railway, summarized the experiences of the New York, New Haven & Hartford Railroad and the New York, Westchester & Boston Railway in so far as they related to the construction and maintenance of the overhead system.

On the New Haven system three types of catenary construction are used; double, compound and single. The first-named was originally considered necessary to provide rigidity, but as first installed it was found not adapted to high-speed service. It was made flexible by the addition of a steel contact wire supported by clips from the copper conductor. The double catenary pro-

use. Steel trolley wire rusts considerably and the rust is washed off by rain and drips upon coaches and locomotives, making them unsightly and necessitating frequent painting. If there is not sufficient traffic to keep the under side of the wire bright the rust causes increased sparking and burning of pantograph shoes. On the subject of insulators he stated that the temperature strains in porcelain insulators should be given careful consideration, especially in the dead-end type. Failures have been caused by steam train operation in the electrified zone, breakdowns being most frequent where clearances between the locomotive stack and the insulator are restricted or where steam engines stop under or near insulators. Where clearances are restricted insulators should be located off the center line of the track or two insulators in parallel should be used. In tunnels two insulators in series are advisable.

On the New Haven electrification between Woodlawn and Stamford the bridges were designed so that all overturning moments were taken at the base, requiring large foundations. In later construction the bridges were designed so that the corner connection between the post and truss takes the moment acting across the track. The foundations need then only resist the overturning moment and the shear along the track and can thus be made much lighter. Cross-span construction is adapted for use over a large number of tracks equipped with single catenary, both on main line and in yards.

Mr. Amberg described a flexible wood section break for use in catenary construction, as shown in an accompanying illustration. It is designed to eliminate the hard spot produced by the rigid break. The break proper is connected in the line between two movable sheet-iron approaches. To prevent a train being stalled on the break, flexible wings of heavy steel wire, placed as shown, insure continuity of pantograph contact. These breaks are not necessary in yard construction on account of the slow movement of trains. On the New Haven line, air sectionalization is used wherever possible but there are a number of places where wood section breaks must be used.

Mr. Amberg gave also some curves and tables of

CONTACT SYSTEMS—FLEXIBLE SECTION BREAK NEW HAVEN SYSTEM

vided insurance against messenger-wire breakage but it involved several disadvantages. As two live messenger wires were carried over the bridges power had to be cut off to permit work to be done on the trusses. Lightning trouble was experienced with the insulated messenger wire even with electrolytic lightning arresters. The compound catenary provides a grounded messenger wire over each track, removing live parts from the trusses, eliminating lightning trouble and at the same time keeping the trolley wires nearly over the center of a track without the use of pull-off poles except on curves. On curves above 2 deg. the temperature has an influence on the alignment of the contact wire, requiring the use of pull-off spans between bridges. Single catenary is used for both main line and yards. In the latter the copper conductor can be omitted.

Mr. Amberg predicted that steel contact wire will be used less in future although its first cost favors its

costs somewhat similar to those given by W. S. Murray in his Philadelphia paper abstracted in the issue of this paper for Jan. 30, 1913, page 229.

Mr. Zogbaum gave the results of operating experience on the New York, Westchester & Boston Railway. He stated that it has not been found advisable to stagger the contact wire to secure uniform wear on pantograph shoes, but called attention to the necessity for allowing for swaying movement of locomotives and cars in locating the contact wire, especially on curves. Trains running at high speed on curves sharper than 1 deg. swing the pantographs toward the outside of the curve. More than 30 per cent of the 54¼ miles of contact wire on this system is over curved track, requiring slight adjustment from time to time.

In addition to the contact wire this system includes 181 miles of transmission line of which 109 miles are

for traction power only, and the balance includes signal feeders and control lines. In the catenary system are six sectionalizing bridges and seventy-seven high-tension oil circuit breakers used for sectionalizing the high-tension power. In maintaining this system a force consisting of an engineer of maintenance, a general electrical foreman, one day foreman, one night foreman, five linemen and one assistant lineman is required. The force is able also to do the necessary construction work. It uses a work train consisting of a gasoline-electric locomotive and a work car, the locomotive containing an overhead platform. On the work car is a searchlight for use in making inspections and repairs.

Very satisfactory operating efficiency has been secured, there having been in 1913 27,927 car-miles operated per pantograph failure; in 1914 55,503 car-miles, and in the three months ending March, 1915, 64,799 car-miles. The causes of pantograph breaks were: wire off center, low joints on running rails on curves, overhead frog on deflector out of adjustment, and loose sleeves on contact wire. In 1913 practically 880,000 train-miles were made with 210 delays of a total duration of 2170 min. from power trouble, and seventeen delays with a total duration of 129 min. from pantograph and contact-wire trouble. In 1914, with practically the same mileage, power trouble produced but ninety-seven delays of 2256 min. duration, while pantograph and contact-wire trouble produced fifteen delays of 117 min. duration. In the first three months of the current year, with proportional mileage, there was no power trouble, and but one delay of 2 min. duration from the other source. Details of the causes of the various delays were given, and train-minutes delays by months were charted. The road has an excellent insulator-failure record, troubles from this source being practically negligible.

The wear on the under side of the grooved-steel contact wire has produced a $\frac{1}{8}$ -in. flat surface, and this has been uniform over the line, no difference being noted between high wire and low wire, tangent track and curves. From present indications the steel wire will have a total life of from six to seven years. Pantograph mileage varies from 1000 to 1300 miles in the winter up to considerably more than 2000 miles in the summer. The higher mortality in winter is due to the necessary increase in tension on account of the contraction in the contact wire. The total maintenance cost per car-mile for July, 1914, is given as 1.56 cents and for December, 1914, as 1.42 cents, including supervision of transmission and contact system, miscellaneous electric line expenses, work train, etc. Details of the actual expenditures for selected months are included in the paper. It also contains a digest of the operating rules and regulations of the organization.

CONTACT SYSTEM OF THE SOUTHERN PACIFIC COMPANY, PORTLAND DIVISION

Paul Lebenbaum, electrical engineer Portland, Eugene & Eastern Railway, described the overhead construction of the electrified lines of the Southern Pacific Company between Portland and Whiteson, this being the first electrification in Oregon of the Southern Pacific System. The electrification involved 104 miles of single track with approximately 16 miles of second track and siding. With the exception of 3 miles of 600-volt trolley in Portland, the operating voltage is 1550. Electric operation was begun on this system in January, 1914.

In general, side-bracket catenary construction of the type shown in an accompanying illustration is used, the

13,200-volt high-tension line being carried on the same poles on parts of the system. Standard pole spacing

CONTACT SYSTEMS—STANDARD BRACKET CONSTRUCTION
PORTLAND DIVISION, SOUTHERN PACIFIC COMPANY

CONTACT SYSTEMS—SINGLE-TRACK CURVE CATENARY CONSTRUCTION, WITH 13,200-VOLT TRANSMISSION LINE, ON PORTLAND DIVISION, SOUTHERN PACIFIC COMPANY

CONTACT SYSTEMS—STANDARD PULL-OFF CONSTRUCTION
PORTLAND DIVISION, SOUTHERN PACIFIC COMPANY

on tangents is 150 ft., but the average rate of distribution of poles is fifty-four to the mile, there being 25 per cent of the main line mileage in curved track. The standard pole length for catenary construction is 35 ft. and for transmission and catenary 40 ft. These poles cost at the hole as follows: 35 ft., \$6.90; 40 ft., \$7.50; 45 ft., \$8.25; 50 ft., \$8.85, and 55 ft., \$9.60, the lengths greater than standard being used for telephone and telegraph line crossings, etc. All poles were given two brush treatments with carbolineum avenarius from a point 18 in. above the ground to within 3 ft. of the butt. The preservative was applied by means of burlap fastened to the ends of long mop handles, and it was kept hot by steam coils placed at the bottom of the shallow tank over which the poles were rolled. Approximately 1 gal. of preservative, including losses, was used per pole.

The catenary hanger used was of the loop type. As roller pantographs were used, great flexibility of the contact system was necessary, especially on curves. On the latter a pull-off construction like that shown in an accompanying illustration was used.

Basing the annual cost of maintenance on the experience from Oct. 1, 1914, to March 31, 1915, when the contact system was almost new, the values are: For material, \$804; for labor, \$7,320, a total of \$8,124, or \$78.11 per mile per year. The maintenance crew consisted of one foreman, three linemen and four groundmen. In addition to maintaining the contact system this crew handled all repairs to the 13,200-volt transmission lines and 2 1/2 miles of 60,000-volt transmission lines. Gasoline section motor-cars, equipped with towers are used for maintenance. On the electrified section the average train-miles per day are 1460, motor-car-miles per day, 3041, and trail-car-miles per day, 560. The weight of the motor-car is 53 tons, that of the trail car 35 tons and the schedule speed is 20 m.p.h. The average running current per motor-car is 200 amp. The cost of maintaining the roller collectors, which are now equipped with roller bearings, is about 40 cents per 1000 motor-car-miles. The collectors are made of 5-in. steel tubing and they are operated at a pressure of from 30 to 35 lb. against the wire. The mileage per collector has been about 9700, but this

CONTACT SYSTEMS—STANDARD CATENARY HANGER PORTLAND DIVISION, SOUTHERN PACIFIC COMPANY

record was lower than it should have been because a defective quality of tubing was originally furnished. The wear on the trolley to date has been inappreciable.

THIRD RAIL AND TROLLEY SYSTEM OF THE WEST JERSEY & SEASHORE RAILROAD

J. V. B. Duer, assistant engineer Pennsylvania Railroad, Altoona, Pa., gave construction and operating data regarding this property in addition to those already available. The system has a total of 131.7 miles of third-rail track and nearly 20 miles of trolley track, about a mile of the latter overlapping the third-rail. Substations are 10 miles apart and no third-rail feeders are used. The substation bus voltage is 700. Trains of from two to seven cars are operated between Camden and Atlantic City.

The third-rail insulators are of reconstructed granite or porcelain and are held in position by a metal centering cup which is secured to the ties by means of lag screws. The rail rests upon the insulator and is not clamped thereto. The insulators are placed on

CONTACT SYSTEMS—PRESENT THIRD-RAIL CONSTRUCTION
WEST JERSEY & SEASHORE RAILROAD

ties 9 ft. 4 in. long, spaced approximately 8 ft. apart. This type of insulator, shown in an accompanying illustration, has been adopted on account of a change in the method of supporting the top protection board.

Originally the third-rail was equipped with protection only at stations, 75 ft. on either side of road crossings, and in terminal yards. This protection consisted of side and top boards carried from castings attached to the rails by hook bolts. Maple posts were attached to the bottom castings by bolts and supported top castings carrying the top protection boards. During the early part of 1912 top protection was added to all unprotected rails using the plan already mentioned. The boards were treated with two coats of hot creosote, and contiguous boards were joined by means of wrought-iron plates.

The original cost of construction of this line was as follows: For the 131.73 miles of third-rail, including the rail, bonding, insulators, protection, etc., \$557,636, or \$4,235 per mile; for the 19.56 miles of trolley, including wires, poles, line material, lightning arresters, etc., \$80,500, or \$4,120 per mile. The track bonding of 151.29 miles cost \$102,659, or \$678.50 per mile.

Shortly after the third-rail was placed in service it began to creep in the direction of traffic, with constant

CONTACT SYSTEMS—STANDARD THIRD-RAIL APPROACH
WEST JERSEY & SEASHORE RAILROAD

damage to insulators. To overcome the difficulty the third-rail was anchored to the ties at intervals of from 1000 ft. to 1500 ft. and the practice of periodically loosening the splice bars and oiling the joints was instituted.

Although sleet-cutting shoes were used on the cars during certain seasons, with a provision for applying extra tension of from 90 lb. to 100 lb. to the shoes, considerable delay was occasioned by sleet. This has been minimized by the use of calcium chloride supplied from tanks and distributed hot on the rail. These tanks were hauled over the road by steam locomotives when sleet began to form, with good results. The addition of the top protection to the rail prevented sleet formation except when a driving wind accompanied the sleet-forming weather, in which event the chloride cars were used as formerly.

During seven years past the average maintenance cost per single-track mile per year has been \$490.25 for the trolley, \$81.74 for the third-rail, and \$25.84 for the track bonding, which amounts are respectively 11.9, 1.9 and 3.8 per cent of the corresponding investments.

During the year 1912 the car-miles per minute of detention from various causes chargeable to the contact system were as follows: Third-rail short-circuits, 56,673; third-rail out of place, 1,161,809; third-rail protection out of place, 232,362; sleet on third-rail, 11,885, and trolley-wire trouble, 17,085.

CONTACT SYSTEM OF THE BUTTE, ANACONDA & PACIFIC RAILWAY

In an elaborate paper J. B. Cox, railway engineering department General Electric Company, described many of the special problems of the design of the rollers and overhead construction for this electrification. Overhead construction was used because approximately 60 per cent of the electrified tracks consist of yard trackage and sidings with numerous switches and street crossings.

The roller used consisted of a Shelby steel tube 5 in. in diameter, 24 in. long and $\frac{1}{8}$ in. thick when turned. Removable bearing housings of aluminum metal were fitted into each end of the tube, each carrying two bronze sleeve bearings. The complete roller revolved about a $\frac{5}{8}$ -in. steel shaft fixed at each end by clamps to the pantograph frame. The complete roller weighed about 31 lb. As this weight was much greater than that of the contact element of a sliding pantograph, it was decided not to attempt to make the contact device respond to inequalities due to hard or uneven spots in the trolley wire but to remove such spots. After experience with the operation of this roller it was modified by installing Hyatt roller bearings, which have proved very satisfactory. Early troubles in keeping the roller on the trolley wire have been overcome by the installation of improved wearing or guide plates.

In producing a flexible trolley wire a new hanger was devised. It was made up of $\frac{5}{8}$ -in. x $\frac{1}{8}$ -in. flat strap, with a malleable-iron ear secured by a $\frac{1}{2}$ -in. x $1\frac{1}{2}$ -in. carriage bolt. The upper end was looped over the messenger wire, giving a flexible support. The jaws were designed to permit the operation of a trolley wheel should such be desired. A special pull-off was also designed by means of which the messenger and trolley wires were held in position by separate clamps, from each of which ran an individual pull-off wire with a strut between the two, maintaining the pull parallel to the horizontal plane of the trolley wire and allowing a free vertical movement independent of the messenger. The single pull-off of the type described was found superior to a double pull-off or a rigid pull-off, although these were used in some cases. It was found unneces-

CONTACT SYSTEMS—SECTION INSULATOR FOR PANTOGRAPH COLLECTOR, WITH ATTACHMENT TO SPAN WIRE

sary to use deflectors such as are generally required with pantographs. Instead, the trolley and messenger wires which were intended to follow a switching track were started several feet ahead of the switch from a point convenient for dead ending, and several inches above the horizontal plane of the through wires, and gradually brought down to that plane a short distance ahead of the switching point where they were gradually carried away following over the switching track. Air-section insulation was used where practicable, the ends of the wires of each section being made to overlap the length of a pole spacing, the two sets of wires being carried in approximately the same horizontal plane and about 12 in. apart for a few feet in the middle of the span, from which point the dead ends of the trolley wire were gradually carried above the path of the collector to the anchorage.

At street railway crossings two wooden section insulators were connected in the 2400-volt line about 75 ft. apart with a protecting zone between. The railroad tracks cross street railway tracks at six points, four of which are at street level in Butte. Two in Anaconda are not at street crossings and here the street railway company coasts its cars over the crossings. At two crossings in Butte watchmen employed to operate gates manipulate the switches which are interlocked with the gates. Special commutating switches were provided to overcome arcing difficulties.

The total cost of the trolley and feeder system, inclusive of bonding and all changes made necessary in the way of clearance for poles, bonding, etc., up to June 30, 1914, was slightly more than \$500,000, or for the overhead system, including feeders and bonding, \$5,514.15 per track-mile or \$13,381 per route-mile. All of the construction was done while the road was under full operation and under many conditions which tended to increase the cost above normal. Among these were: the large percentage of curves and special work, the high price of all labor, interference of foreign wires, changes

CONTACT SYSTEMS—ROLLER PANTOGRAPH MOUNTING WITH IMPROVED WEARING PLATES

in location of tracks, walkways, platforms, buildings, trestles, bridges, etc., extra-heavy foreign traffic on the main line, strike of electrical wiremen, cold weather, variation of ground condition, number of street railway crossings, etc. Seldom would there be found more complications than in this case.

Repair work on the 2400-volt trolley line is done from an ordinary wooden work car without special insulation with full voltage on the line and there have been no serious cases of shock to linemen.

The cost of maintaining the distribution system from October, 1913, to March, 1915, inclusive, has been slightly under \$15,000. This is at the rate of \$9,930.46 per year or \$109.13 per mile per year. The paper gives full details of maintenance costs. Measurements have been recently made to determine the rate of wear of the trolley wire, the original diameter of which was supposed to average about 0.482 in. With due allowance for the change in the form of the wire as it wears, and from the fact that the measurements show an average of 3041 pantograph passages per 0.001 in. wear, the wire can be expected to last twenty-two years.

The difficulties with the contact roller have not been greater than were expected. At first

CONTACT SYSTEMS—HIGH-TENSION THIRD-RAIL ON EXPERIMENTAL LINE IN ERIE. AIR-OPERATED THIRD-RAIL COLLECTOR FOR HIGH VOLTAGE LINE IN MIDDLE WEST

sticking in the bearings occurred due to imperfect alignment of clamping jaws, loosening of the caps in the bearing head, collection of ice between the roller and the support, etc. These were overcome by simple expedients, including the adoption of roller bearings already mentioned. From results so far obtained the average mileage per tube is about 11,030. The average mileage with roller bearings is about 16,000, an increase of 35 per cent. The average cost of maintaining the original pantographs with three bearings was about \$185 per month, or \$3.20 per thousand locomotive-miles. The present corresponding cost is about \$35 per month, or \$0.62 per thousand locomotive-miles. At first a wooden lining was pressed inside the roller, but this was found unnecessary and is now omitted.

Measurements made to ascertain voltage drop and energy consumption show the maximum voltage drop to be 14.5 per cent, the average being 5.6 per cent. In the Smelter Hill service, with an average train weight of 1633 tons and a schedule speed of 15½ m.p.h., at an average voltage of 2293, the average power consumption was 1398 kw., and the current 767 amp., while the unit energy consumption was 55 watt-hours per ton-mile. From Rocker to East Anaconda, with a schedule speed of 20.1 m.p.h., the average was 13.73 watt-hours per ton-mile.

CONTACT CONDUCTORS AND COLLECTORS FOR ELECTRIC RAILWAYS

The problem of current collection as a whole and the essential factors in successful operation were discussed by C. J. Hixson, railway engineering department General Electric Company. He called attention to the fact that the A. I. E. E., when defining standards for electric railways, subdivides distributing systems into two classes—contact rails and trolley wires. He followed the same subdivision in contact devices, namely, contact rail collectors and trolley wire collectors. Similarly,

CONTACT SYSTEMS—WIRE WEAR WITH SLIDING CONTACT CURRENT COLLECTION

rail collectors were subdivided into: third-rail shoes, overhead shoes, center shoes, and underground shoes. Trolley-wire collectors were classified as wheel trolleys, roller trolleys, and slider trolleys. The frames supporting the collecting mechanism may be pole, bow, or pantograph. The term "pantograph trolley" is not definite, since it designates a form of frame common to all three types of trolley wire collectors.

Contact-rail systems possess great reliability and involve low maintenance cost. They are particularly adapted for elevated and subway work, especially where it is necessary to change quickly from one to the other. High collecting capacity and space considerations are also in their favor. The high initial cost, danger to life, difficulties from sleet and snow, and complications in yards have been among the factors preventing their wide application to interurban and steam road service. Inverting the rail and using an underrunning shoe have overcome sleet and snow difficulties with some increase in cost. A 2400-volt third-rail is operative and its use permissible under some conditions.

Contact-wire systems are of two types, direct suspension and messenger or catenary suspension. The

CONTACT SYSTEMS—1200-VOLT SUSPENSION WITH PORCELAIN INSULATION

direct suspension is suitable for low speeds and moderate amounts of power and, with the contact wire insulated by suspensions of molded insulation or other suitable material, gives good service. Giant strain insulators are in many cases connected in the span wires. The wood pole is undoubtedly responsible for much of the success of direct suspension. The use of wood for poles and insulators is gradually decreasing and porcelain is being adopted for strain and suspension insulators. Direct suspension is cheap and has performed useful service in keeping down initial investments, but with increasing speed and capacity requirements a more flexible form of construction is needed.

With messenger suspension the effect of the messenger wire is of great assistance in increasing the

quency of steady braces against action of the wind.

Construction at tunnels and bridges both as regards insulation and collection.

The necessity for uniformity in the safety factors allowed in different parts of the country.

The best method of arranging "ticklers" for warning the brakeman of approaching bridges or tunnels upon electrified lines.

In regard to the problems which might be discussed in connection with trolleys might be mentioned:

The desirability of the air-locked vs. the air-raised type.

Height of the trolley wire.

Width of contact strips.

Shape of horn.

Clearance allowances between trolley and permanent way.

DISCUSSION ON CONTACT SYSTEMS

In the discussion of the topics covered in the papers and in connection with the presentation of the papers by the authors many valuable additional points were brought out. Mr. Duer said that on the West Jersey & Seashore Railroad reconstructed granite insulators are being used to replace worn-out porcelain ones. One reason for the selection of the same rail section for the contact rail as for the main rail was to give facility in making track repairs. He called attention to the independence of the new protection which he described from the contact rail, insuring non-interference with creepage, expansion, and contraction. Insulated anchors had been tried in an endeavor to prevent creepage, but they were the source of fires, and their use was abandoned in favor of oiling the angle plates. Stranded bonds have been substituted for ribbon bonds to give increased flexibility, although Mr. Duer thought that the latter might be satisfactory with very well ballasted track. The bond testing is done in a preliminary way by men equipped with contact points in their shoes connected to an indicating instrument. These men mark bad bonds for further and more accurate test. In reply to questions regarding the chloride treatment of steel he said that the specific gravity of the solution is 1.2 and that the solution is spread by means of special shoes. An overrunning conductor rail should be wide and low for stability, but raised on high insulators to protect the latter from stray ballast. Careful attention should be given to side and end approaches, as the shoes on high-speed cars are apt to be thrown against the protection boards at these points. On the West Jersey & Seashore Railroad end protection boards have to be renewed annually on account of the wear due to contact shoes. Metal sheathed side approaches were used on the Pennsylvania Railroad New York terminal.

Mr. Cox stated that on the Butte, Anaconda & Pacific electrification the safety of people who could not be kept away from the tracks was an important factor in the choice of an overhead contact system. In the paper no detention records were given because detentions had been negligible. While the dispatcher notes detentions on his record sheet they have not been important enough to warrant tabulation. Most of the troubles with the rollers at first were due to their not rolling.

Mr. Hixson said that he had felt the necessity of obtaining a comprehensive grasp of the whole subject of contact systems, and the purpose of his paper was to summarize the situation. The measurements described were the result of an effort systematically to improve operating conditions. He emphasized the im-

CONTACT SYSTEMS—TROLLEY WAVE CREST CURVE AND POSITIONS OF MESSENGER

height of the wave produced by the passage of the collector. The crest of this wave is over the collector and the height depends upon the elasticity at that point. If the hanger is designed to permit a free further upward movement of the trolley additional flexibility is secured.

Mr. Hixson gave the results of measurements made to determine the upward deflection of the trolley wire under different conditions of support and pressure. Typical results are shown in the accompanying diagrams. He also gave a pair of characteristic pantograph curves showing the relation of roller pressure to roller position, and other curves of importance in current collection under heavy traction conditions. He concluded by listing the following as topics worthy of discussion in this connection:

The use of deflectors or other devices at sidings.

The best method of section insulation.

Convenient means for taking up slack at anchorage vs. automatic take-up devices in conjunction with the introduction, artificially, of elasticity into the line.

Elimination of splicing sleeves, particularly of the soldered type.

The necessity for staggering the trolley wire and fre-

CONTACT SYSTEMS—TROLLEY WAVE CREST CURVES FOR DIFFERENT PRESSURES

portance of the flexibility of the messenger wire in absorbing waves as indicated by the hanger loop, which is lifted less at the center of the span than at the points of support. The pull-off presents the most difficult problems in overhead design and in choosing a method of support the designer must decide as to the influence to be allowed special construction, such as that on curves, in determining the plan to be followed.

G. H. Hill, engineer railway engineering department, summarized briefly a contribution to be published later in the proceedings. He stated that the costs of third-rail and trolley construction are about equal. The former is necessary with low-voltage heavy traction, but the general tendency is toward overhead construction. The lubrication of overhead pantograph shoes is a very important matter and can be accomplished readily, one plan being to use an inverted pressed-steel pan, shod with copper strips and with a central groove for storage of lubricant. The lubricant consists of graphite grease. This forms a film on the contact wire and incidentally prevents sleet accumulation. Adding lubricant does not interfere with current collection for the contact electrical resistance is actually lowered. Taking up the important subject of inductive voltage rises in overhead wires and in third-rail, Mr. Hill stated that there is a considerable rise and that this is about the same in the two. While the inductance of the rail is greater this produces a time lag which keeps down the voltage. The energy discharge is, of course, much greater from the rail. The peak voltage may be double the operating voltage.

H. M. Hobart, consulting engineer General Electric Company, described a novel form of third-rail construction being installed on the 1200-volt electrification in England between Manchester and Bury. This will be open for traffic in a few months. The rail is of the side-bearing type of channel section, protected all around with the exception of a top slot to admit the flat, hinged collector shoe. The rail with its protecting boards rests loosely in a slot on the top of the insulator and the protecting boards are held in place by means of steel spring clips and wooden wedges. Additional details of this installation will be given in an early issue of the *ELECTRIC RAILWAY JOURNAL*. The rail is the invention of J. A. F. Aspinall, general manager Lancashire & Yorkshire Railway. Mr. Aspinall is essentially a steam railroad man who appreciates the possibilities of electricity as a motive power. The installation is attracting much attention in Great Britain.

In reply to a query Mr. Zogbaum stated that wood insulators are generally used between tracks on the New Haven system with good results. They are thoroughly cleaned every three years. Prof. D. D. Ewing wanted to know if the maintenance cost of running rails is increased by the presence of the third-rail, and Mr. Duer said he would furnish data on that subject.

Prof. D. C. Jackson, Massachusetts Institute of Technology, chairman of the railway committee in charge of the program of the railway session, closed the discussion by referring to some research work which Dr. A. E. Kennelly, Harvard University, and he had under way relating to skin effect in rail conductors. This promises interesting results which will bear upon the subject of inductive effects in third-rail.

The session closed with an expression of its unique character and of the great value of the cost data contributed, such data being as a rule almost inaccessible.

A. S. T. M. Specifications for Trolley Wire

Committee on Copper Wire Outlines Reasons for Failure to Agree with American Electric Railway Engineering Association

At the eighteenth annual meeting of the American Society for Testing Materials, held in Atlantic City on June 22-26, the report of most importance to electric railways was that on copper wire specifications. In this the differences between the A. S. T. M. committee and the committee on power distribution of the American Electrical Railway Engineering Association were outlined as follows, the A. S. T. M. committee being referred to as Committee B-1 and the A. E. R. E. A. committee as the Power Committee:

"In the last two reports of the committee, reference has been made to work undertaken in conjunction with a sub-committee of the Power Committee of the American Electric Railway Engineering Association, with a view to the formulation of specifications for trolley wire, which might be adopted as the standard by both societies. Specifications were tentatively proposed by the A. E. R. E. A. sub-committee, which were reluctantly accepted by the sub-committee of Committee B-1. But Committee B-1 could not agree to these specifications, which in some important respects were different from our standard specifications, and radically at variance with definitely expressed opinions of the committee. Therefore, in 1914, Committee B-1 reported postponement of final action on these proposed specifications, and began to collect data and opinions from a number of large electric railways using trolley wire, on their practice with respect to specifications, and the necessary requirements for such wire. This canvass showed that a considerable majority of those roads buying under specifications had already adopted substantially the requirements of the standard specifications of this society. Many large purchasers were using no specifications, while others were buying a high-strength alloy wire instead of copper. In the meantime the Power Committee had presented to the American Electric Railway Engineering Association at its annual meeting, the proposed specifications which have been adopted.

"Finally at a meeting of Committee B-1, with nine of the eleven members present, it was unanimously voted that Committee B-1 recommend no change in the present standard specifications for hard-drawn copper wire in so far as they apply to trolley wire.

"For the information of the society, the committee makes this brief statement of the two points of difference between themselves and the Power Committee of the A. E. R. E. A.: (1) The Power Committee was of the opinion that trolley wire should not be hard drawn but should, in effect, be somewhat less than hard drawn, that is, more nearly what is defined as medium hard drawn; yet the values for strength proposed were, for minimum values, substantially those of our standard specifications for hard-drawn copper wire. (2) The Power Committee, after long consideration and after many tests had been made, appeared to agree that the twist test, upon the inclusion of which it was insistent, could only safely be applied qualitatively; yet the committee insisted upon specifying a definite minimum number of twists.

"To neither of these points could Committee B-1 agree. The first was considered inconsistent. The second the committee felt was adequately covered in the specifications as offered for amendment later in this report, namely, by the requirement that the wire shall be free from imperfections not consistent with best commercial practice. In the opinion of Committee B-1,

A recent disastrous wreck in England was caused by the entry of an express train into a block where a local train was standing, an improper clear signal having been given by the manual-block operator.

other tests than the twist test may be preferred for the inspection of wire, and the committee sees no reason to make arbitrary choice among them."

The report went on to say also that as a result of the canvass of the practice of electric railways, Committee B-1 was convinced of the desirability of offering specifications for high-strength alloy trolley wire, and tentative specifications for this material were appended to the report. These provided for bronze wire of 40 per cent conductivity and approximately 70,000-lb. tensile strength and from 2.25 per cent to 3 per cent elongation in 10 in.; also for bronze wire of 65 per cent conductivity, about 60,000-lb. tensile strength and the same elongation, which depended on the size of the wire.

Tentative specifications for bare concentric-lay copper cable, hard, medium-hard or soft, were also submitted and both of these were ordered printed in the association's year book. Minor changes in the previously-mentioned specifications for hard-drawn copper wire were referred to letter ballot.

Mandatory Rules *

BY F. M. METCALFE, SPECIAL REPRESENTATIVE FIRST VICE-PRESIDENT OF THE NORTHERN PACIFIC RAILWAY

The railroad workman of to-day is no longer an automaton. He has developed into a reasoning being. This has created new economic conditions and demands progressive methods.

The rules by which we are governed in our railroad work have been amended and amplified from time to time, as our business has increased, and have become more progressive and complex. To-day they are the product of the minds of our ablest and most experienced railway operators, formulated after much study and discussion and presented as the acme of good practice. The standard transportation rules are largely mandatory. They tell men what they must or should do. But by the frequent and continued infraction of these rules, despite disciplinary action, railroad managers now realize that education and persuasion must substitute coercion and compulsion, as is illustrated by their vast annual expenditures for increased supervision.

My belief is that mandatory rules do not materially prevent accidents but that organized effort and the persuasive use of safety devices and methods are the means which should be substituted.

Transportation by Fadgl Auto-Train at San Francisco Exposition

The Fadgl Auto Train, Inc., has been carrying approximately one-fourth of all Panama-Pacific Exposition visitors in eighteen three-car trains of sixty-six seating capacity or 105 total capacity per train. The longest run one way is 1½ miles and the shortest is ¾ mile. The initial fare is either 5 or 10 cents, according to the character of the run. Zone-fare additions of 5 cents each are charged when passengers make partial or complete circuits.

On Feb. 20, the opening day, fifteen two-car trains and one one-car train carried \$3,246.95 of business. Up to June 1 about 1,250,000 passengers were carried, but it is expected that heavy summer business will bring the total for the year in excess of 4,000,000. The number of fares during four days of June averaged 15,150 a day.

All fare collections during this period were handled with Rooke registers.

Medical and Claim Departments *

BY J. H. HANDLON, CLAIM AGENT UNITED RAILROADS OF SAN FRANCISCO

The relationship existing between the medical departments and the claim departments of rail transportation companies varies to such an extent that there is no general uniformity of co-operation. Some companies do not maintain a salaried medical staff but secure the services of outside surgeons when necessary. Others, particularly street railway companies, designate resident surgeons to examine the injuries in their several districts and report on a fee basis to the salaried chief surgeon of the company. These district surgeons also render emergency treatment. Many steam railroads and interurban and suburban electric railways adopt a similar plan on account of the convenience of having a surgeon representing the company promptly at the scene of the accident.

Some companies maintain a salaried medical staff, which, if possible, renders immediate and continuous surgical and medical attention at the sole expense of the company and without respect to the question of liability. Still others employ a salaried emergency surgeon who is always on duty, ready to make an immediate examination of personal injury cases and treat such cases, if necessary.

It is the practice of the United Railroads of San Francisco to request an early examination of all injured persons by one of its salaried medical staff, regardless of whether a claim has been filed or such action is intended. Medical attention and hospital accommodations are offered only in cases where the company's liability is clearly established. Emergency treatment is usually rendered by the city emergency hospital surgeons or surgeons residing or having their office near the scene of the accident. A fee of \$10 is allowed by the company to practising surgeons whose services are sought in an emergency by an employee.

Wherever feasible (local conditions always governing) the services of the medical department are more effective if it is composed of surgeons who are on the payroll and devote almost all of their time to company business. It is true that surgeons who are occasionally employed on a fee basis are not so likely to have their testimony attacked as prejudiced and biased, but unscrupulous attorneys often attack the reliability of such witnesses, particularly if they have testified on several occasions in behalf of the defendant corporation.

The surgeon whose time is devoted almost exclusively to the company becomes a specialist in personal injury cases. He is aware of the dependence placed upon him by the claim agent in reporting as accurately as possible the extent and length of disability, and he is alive to the advantage of employing simple and unsuspected tests of the claimant's veracity and physical ability. He is able to judge the monetary value of a claim and the reasonableness of charges for surgical services. If he is tactful and considerate in his behavior toward a claimant, he can influence him to deal directly with the company. It is highly important, however, that he should not make an intentional misstatement of the extent of the injury to an injured person with a view of minimizing the injuries and so enabling the claim agent to effect an unjust settlement. Neither should he resort to any similar deception, for the courts have held that a release secured through such fraudulent methods is voidable. An error in diagnosis is excusable in the eyes of the law.

*Abstract of paper presented at annual meeting of Pacific Claim Agents' Association, San Francisco, June 24-26.

COMMUNICATIONS

Flange-Bearing Special Work

METROPOLITAN STREET RAILWAY COMPANY

KANSAS CITY, Mo., June 25, 1915.

To the Editors:

Concerning the question of flange-bearing special work, the following is my experience in Kansas City: In order to avoid noisy special work and the hard blows incident to the use of very abrupt rises in the flangeway, the writer adopted flange-bearing work with long approaches about four years ago. Experience with this type of work since that time has fully justified the change.

The principal problem to solve in connection with the flange bearings was the lengths of the inclined approaches to the intersections. It was impossible to get the desired results with the small manganese inserts that were in use a few years ago. Moreover, the best results cannot be obtained with the largest practicable plates used to-day except in those in very acute angle intersections. If it is practicable, the length of the approach from the point where the flange begins to take a bearing to where it is raised to its greatest height should not be less than 18 in. In order to secure approaches of this length we built some special work of carbon rails bolted together with the manganese fillers forming the flangeway floors. Similar construction with a bar of manganese inserted in a rolled filler in the bottom of the flangeway was adopted, and both types of work have given most excellent service. Later, crossings were assembled as bolted work, using high carbon rail in the bottom of the flangeways. This has given results as good as, if not better than, were obtained from that with the manganese in the bottom of the flangeway.

In all of these types of work, when the flangeway is worn down so that the wheels have a tread bearing, it is practicable to grind down the head of the rail and thereby secure a true flange bearing again. Our later work, some of which has been ordered in the solid manganese steel, provides for a flange bearing with 18-in. approaches. A feature found undesirable in our first flange-bearing crossings was the raising and lowering of the wheels over each flangeway intersection. To avoid this, it has been our practice, and it has proved entirely satisfactory, to raise our wheels upon the flange as they approach the first intersecting flangeway and continue the shallow depth through the crossing. This has been done in right-angle crossings and the wheels are carried upon their flanges entirely through the crossing or series of crossings as the case may be.

The only argument that the writer has ever encountered in recommending shallow flangeways has been that they might be the cause of chipped or broken wheel flanges. Curiously, these arguments have never been advanced by men connected with the mechanical departments or by the manufacturers furnishing wheels under contract. In fact, discussions with them of the effect of this practice has indicated that the adoption of the full flange bearing makes an easier riding car, reduces the shock to the equipment and causes less damage to flanges than the non-flange-bearing intersection, or one with a shallow groove only at the intersecting flangeways. Some manufacturers of cast-iron wheels have advocated a change in the contour of wheel flanges to give a wider bearing on the bottom of the flangeway than that given by the standard wheels. This change was only presented as a theory and has never been tried out.

As noted in some of the other communications, the

flange-bearing idea is an old one; in fact, it is so old that testimony in regard to the matter twenty years ago indicated that it was an obsolete practice. On the other hand, no doubt, the adoption of long approaches, giving a slight angle of impact at the point where the wheel flanges strike the bottom of the flangeway, has again made this practice useful and satisfactory. In conclusion I will say that there have been installed in Kansas City some thirty or forty crossings, built with flange bearings, and also a large number of frogs of various angles, and our experience with all of this work has fully justified our continuing its use.

A. E. HARVEY, Chief Engineer.

The Jitney and the Small Car

THE SOUTHWESTERN ELECTRICAL & GAS ASSOCIATION

DALLAS, TEX., June 29, 1915.

To the Editors:

I have been very much interested in the communication on "Jitneys vs. Light Cars" by Mr. Wilson of Mobile, Ala., in your issue of June 26.

Mr. Wilson is absolutely right in the first portion of his communication with regard to the profitable advantage of more frequent operation of cars or, to put it in another form, of more rapid service. The writer has proved this fact in times past in several small cities where the business section was only a comparatively few blocks from the residence section. He has taken non-paying properties and made them pay, largely by giving a more frequent, more rapid and a perfectly regular and dependable service, and the frequency of the service has been the main point of success. The instance which Mr. Wilson gives of the city where the revenue of the street car company had been reduced \$1,000 per day by something over 350 jitneys, gives a case in point. In the five months during which the jitney has been in active operation, the revenue of this company has been reduced \$150,000. Even allowing 33 1/3 per cent of this due to the hard times, the remainder, \$100,000, if applied to the purchase or hire of small cars and their operation on a much shorter schedule on the lines peculiarly afflicted by the jitney, would have saved them a considerable portion of this loss, would have discouraged the jitney, would have had a strong moral effect on the public and, I fully believe, the balance sheet at the end of the year, under the above suggested operation, would have shown a profit instead of a loss.

One of the lessons that the street railways, and in some instances the shorter interurbans, must take to heart from the jitney experience is the desire of the public to "get there" in the shortest possible time and to keep moving while it is getting there. While the public does not like overcrowded cars and prefers sitting down to hanging to a strap, it will, as between the two evils, accept the discomfort rather than the delay, in nine cases out of ten. This applies particularly to the rush hours. The intermediate light traffic hours of shopping, visiting and pleasure automatically provide seats and prevent overcrowding, by reason of the lessened traffic, and at such times a slightly longer wait for the car is not liable to cause complaint or lessen traffic to any great extent. But during rush hours, especially during the business rush hours at morning, noon and night, the ability to get to business or to get home with a minimum of waiting time is the overpowering desire of a majority of those who travel in public conveyances.

In large cities the "skip stop" has been introduced with success, simply to accomplish the end of a more frequent service, and enormously expensive terminals

and loops in city centers have been built, not especially for the end of greater convenience, comfort and safety in handling the traffic, but that the final end of greater dispatch in the vital matter of getting the passenger to his destination without unnecessary delay might be accomplished.

It is true that the abandonment of the large cars may mean a tremendous loss to a great many railway properties, necessitating as it will the virtual scrapping of cars and equipment, the purchase of smaller and lighter cars and the employment of more trainmen, but the handwriting is on the wall that the public will have more frequent service, even if it has to patronize the jitney or its equivalent and put up with its discomfort, inconvenience and danger. When the street railways make it more convenient and more pleasant to ride than to wait or walk, then and then only will street railways obtain all the traffic that is possible, and at that time only will they put themselves in a position where they will not be open to some character of destructive competition such as the jitney.

Outside of this is the matter of public policy which affects the street railways not only directly in their car receipts but indirectly in unfavorable and onerous franchises and taxes and in inequitable accident damage verdicts. As I have said in a previous article, the best three assets of a public utility are "satisfied customers, a pleased public and contented employees." Satisfied customers tend to make a pleased public, and a pleased public helps to make and maintain contented employees. There are yet some few public utilities who argue that it is impossible to "satisfy the public," and where there is this opinion in a public utility there is always a manifestation of it in the service which that utility gives. The jitney has awakened the public to the fact that it needs—and can have if necessary—a more frequent service, which means a lessened wait for the conveyance and, as a rule, a higher rate of speed, or, at any rate, a lessened interval between the starting point and the terminus of the desired trip. If the street car company is wise it will imitate this feature of the jitney as fully as is possible. It may not be able to give as frequent a service as does the crowded line of jitneys; this the public will not ask, for the reason that this effect of the jitney carries the compensating disadvantages of irregularity of schedule and service and also a limited zone of service.

There is one point, however, in Mr. Wilson's communication to which little attention seems to have been paid and which is a basic weakness of the jitney, whether in small or large size. Events within the last few years have proved that no unit vehicle generating its own power can compare in efficiency of operation and maintenance with the central-station-fed vehicle. One of the claims of the jitney as against the street car has been that the jitney was an independent, self-contained and self-operating, trackless vehicle and that therefore the failure of one jitney did not cause the stoppage or delay of other jitneys nor was it possible for any physical cause connected with the vehicles to compel the total cessation of operation of all the jitneys in any one community. It was emphasized that the break-down of a street car greatly delayed the handling of the cars following, that the break-down of trolley lines stopped the operation of all cars on those lines, and that a break-down at the central point of power supply stopped the operation of every street car in the community. This is true to a certain extent, but proper inspection and maintenance of the whole system will reduce this, as it has reduced it in many electric railway systems, to a negligible minimum, and this favorable claim of the jitney is true only to the extent that

the negligence of the electric railway company allows it to happen.

Any vehicle which generates and uses its own power does so in small and therefore inefficient units, and in order to do this it must have a myriad chain of intricate and delicate parts, which not only increase greatly its first cost but also increases its maintenance costs and its probability of break-down or of an increase of inefficiency.

The machinery which actuates the central-station-fed vehicle is, so far as the vehicle itself is concerned, the acme of simplicity and is built so as to give the minimum of maintenance. In nearly every case the machinery on central-station-fed vehicles, such as the street car, is in duplicate all the way through and while a failure of any one part of its propelling machinery may possibly cause a delay, it does not often cause a total cessation of operation, such as happens when the single vital part of a self-contained vehicle breaks down.

The initial economy and efficiency of generation in large units, the present economical method of supply from central station to vehicle and the present efficient propelling apparatus on the ordinary electric car all combine to give such a total economy and efficiency as is impossible with any present vehicle that generates its own power. It must be remembered that in the matter of efficiency "what is sauce for the goose is also sauce for the gander." Any efficient method of generating power in small units on self-contained vehicles can be applied even more efficiently in larger units in a central station, and the average or relative efficiency of large and small generating units has been proved to be such as more than to cover the costs of distribution from the large generating plant to the vehicle that it supplies.

This is the fundamental weakness of the jitney, whether as a small car or as a large bus, and this will be the fundamental weakness of Mr. Wilson's proposition as to self-power-generating vehicles to be used on tracks. When the interurbans first began to parallel steam roads, the gasoline and the gasoline-electric motor cars were pushed forward as being a means by which the steam roads could maintain themselves against the inroads of the electric interurban. With very few exceptions, this type of self-generating vehicle has gone to the scrap heap, has been relegated to little, non-paying branch lines, to locations where there are peculiar local conditions favorable to its use, or has been used for other purposes than comfortable, convenient and rapid transit such as is given by the electric trolley car. On the other hand, not only have the terminals of the larger steam roads done away with the self-power-generating locomotive of all types and kinds, but on their main lines, far away from cities, they are using central-station-fed traction vehicles over long distances, and the main reason for their doing this is economy and efficiency in the operating of the vehicle or tractor. If any further proof were needed on this point, it would be in the enormous increase in the use, in cities, of what is virtually a station-fed vehicle, viz., the storage-battery vehicle, which, as a rule, has proved its economy and efficiency for heavy work over the unit self-generating vehicle, and this notwithstanding the fact that it has an intermediate loss—the battery—to which the direct station-fed vehicle is not subject.

The final failure of the jitney as a competitor of the street car will occur through inefficiency and lack of economy alone, but that final failure might have been hastened tremendously if the electric railway companies had been prompt to take to heart the lesson of the jitney, viz., more frequent and faster service to the public.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

A Convenient Electric Soldering Iron

BY J. N. GRAHAM, MASTER MECHANIC ROCKFORD & INTER-
URBAN RAILWAY

The electric soldering iron illustrated in the accompanying drawing has been in use in the shops of the Rockford & Interurban Railway for the past year. It can be used on a 550-volt circuit and, when connected in series with an ordinary arc-headlight resistance, very good results are obtained in soldering the leads into commutators. It utilizes the heat of the electric arc in keeping the soldering tip at high temperature.

The body of the iron is made from a piece of $2\frac{1}{2}$ -in. round bar copper, turned to the form shown in the section. The point is planed down to $\frac{1}{2}$ in. x 1 in. and is tinned like any ordinary soldering iron.

ELECTRIC SOLDERING IRON

The handle is made of $\frac{1}{4}$ -in. round iron fitted in a groove turned in the body of the copper and bent in the form shown. At the upper end is a grip of wood or rubber used to protect the operator from electric shocks. An arc-light carbon, not less than $\frac{1}{2}$ in. in diameter, is supported, as shown, from the handle by means of an adjustable clamp made of two pieces of flat iron held together by a small screw and nut. The clamp is insulated from the handle with sheet asbestos. It is adjusted so that it slides with sufficient ease to permit regulation of the arc length.

The lead wires are attached as indicated, one to the clamp by means of the screw and the other to the handle inside the grip. To protect the operator's eyes a washer

of transite is slipped over the carbon and rests on the copper. The heating of the copper can be regulated by adjusting the length of the arc.

Preventing Kinking in Handling Wire from Coils

BY J. G. KOPPEL, ELECTRICAL SUPERINTENDENT OF BRIDGES,
SAULT STE. MARIE, MICH.

A recent experience with conduit wiring has impressed upon the writer the importance of careful handling of wire in conduit work. The general principles of conduit wiring are well understood, but this experience may be of interest.

The wiring in question was installed about sixteen months ago in a large new carshop, and all wires were in conduit with suitable conduit outlets for lamps and switches. Recently the new wiring began to give

ILLUSTRATIONS SHOWING INCORRECT AND CORRECT
METHODS OF PAYING OUT WIRE FROM A COIL

trouble, indicated by the blowing of fuses. The substitution of larger fuses did not cure the trouble and a few days ago, when an accidental ground occurred on the trolley wire inside the carshop, some of the circuits were burned out. On removing the damaged circuits several kinks with broken insulation were found, indicating careless work on the part of the wireman in drawing in the wires.

The writer's experience has shown him that very few wiremen know how to uncoil wire by hand, that is without some mechanical device. The following simple method permits the uncoiling of wire without kinks:

Referring to the illustrations, the first one shows the ordinary method of taking off loop after loop from one side of the coil with the resulting kinks as shown. In the second illustration the wireman is taking off loops without the least tendency to kink and it will be noted that he has the coil on his right arm. He unloops two loops of wire in this position, then shifts the coil to his

left arm and pays out two more, alternating in this way until the entire coil is paid out. By this process his wire gets slight twists alternately backward and forward, the twists neutralizing each other.

Hand-Brake Pressures

BY L. W. HORNE, CHIEF ENGINEER LORD MANUFACTURING COMPANY

It will probably be admitted generally that too little attention has been given in the past to the design and installation of hand-brake rigging. Many cars even now are equipped with hand-brake rigging that does not assure uniform pressure distribution among the brakeshoes. The brake rigging of some double-truck cars is so arranged as even to afford no assurance that the brakes will be applied on more than one truck under all conditions.

The condition of unequal pressure is readily understood by reference to Figs. 1 and 2. The arrangement of hand-brake rigging shown in Fig. 1 assures the application of pressure to both front and rear trucks, as it does not embody a fixed fulcrum, the lever simply being hung in a slotted guide. Considering the brake pressure to be delivered to the forward truck, let P represent the brake pressure required in the front-truck top rod, the lower one in the figure, and X the brake pressure necessary to be exerted at the hand-brake rod at the top in the figure. Then the formula is

$$X = P \div g/h.$$

The pressure delivered to the rear truck is, of course, greater, the formula being

$$X = P \div [(g + h)/h].$$

It will be noted that the lever arm g for the forward truck becomes $g + h$ when the pressure is transmitted to the rear truck.

The method of calculating the forces transmitted by the lever system shown in Fig. 1 is sometimes puzzling. A simple diagram, however, will show the manner in which the different fulcrums are obtained. Consider that the hand-brake pull rod has moved the lever so that the brakeshoes have been brought up rigidly against the wheels of the rear truck. The truck-rod connection to the lever then becomes fixed and the lever rotates around it as a fulcrum, applying the brakes on the forward truck. The leverage then obtained is g/h . Considering the rear truck, it follows that when the brakeshoes on the forward truck have been brought up rigidly against the wheels its brake-rod connection to the lever becomes a fulcrum. The lever then rotates about this fulcrum, applying the brakes on the rear truck, and thus is obtained the leverage $(g + h)/h$.

On single-truck cars the brake rigging shown in Fig. 2 is almost universally used. This also produces unequal pressures, having the same fault as the rigging shown in Fig. 1. The pressures on the forward and rear wheels are found respectively from formulas

$$X = P \div a/b \text{ and } X = P \div (a + b)/b.$$

Fig. 3 shows a most dangerous type of brake rigging sometimes used on electric railway cars. With this type of rigging, provided the shoe clearance and slack are not exactly the same on both trucks, the brakes are applied only on the truck having the least travel or slack. With this system of leverage a fixed fulcrum is used and, in applying the brakes, if one truck rod becomes rigid before the other, the lever has two fixed points and cannot rotate any farther. Consequently the brakes will not be applied on the other truck. The formula for computing the leverage developed by means of this rigging is

$$X = 2P \div [(g + h)/h].$$

In comparing the formulas corresponding to Figs. 3 and 1 it is sometimes puzzling to understand why twice

HAND-BRAKE PRESSURES—FIG. 1—DOUBLE-TRUCK CAR-BODY BRAKE EQUIPMENT; FIG. 2—SINGLE-TRUCK BRAKE EQUIPMENT; FIG. 3—DANGEROUS TYPE OF BRAKE EQUIPMENT

This result is at variance with the correct theory of car retardation. A perfect arrangement of brake rigging should always provide a slightly higher pressure on the forward truck, because the car tends to overturn or rotate about the axis of the forward truck. This tendency is due to the centrifugal force exerted during retardation, which transfers part of its proportion of weight from the rear truck.

the force must be exerted in the hand-brake rod to give the same truck-rod pull as is obtained by the lever arrangement shown in Fig. 1. This is explained by considering the travel of the lever. It is well known that power and distance traveled are directly comparable. In Fig. 3 the brakes on both trucks are pulled up at once. Therefore each truck receives only half the force developed, and the travel of the lever is only that of

HAND-BRAKE PRESSURES—FIG. 4—BRAKE RIGGING GIVING PERFECT EQUALIZATION

the travel of one truck rod. In Fig. 1 each truck rod obtains the full pressure by means of a continued pull. In other words, one truck receives the full pressure and then the lever continues to travel until the other truck has also received the full pressure. The travel of the lever, therefore, is the total travel of the rear truck rod plus the total travel of the forward truck rod, or twice the travel of the lever shown in Fig. 3.

For cars not equipped with air brakes the system of hand-brake rigging shown in Fig. 4 produces exact equalization of pressures between trucks and absolute provision for applying the brakes on both trucks regardless of unequal travel and slack conditions. The formula for calculating the required brake pressure at the hand-brake rod for the rear-truck top rod is

$$X = P \cdot \left[\left(\frac{g+h}{h} \right) \left(\frac{e+f}{f} \right) \right]$$

and for the forward-truck top rod is

$$X = P \cdot \left[\left(\frac{g+h}{h} \right) \left(\frac{e+i+j}{f} \right) \right]$$

An arrangement of sheaves (Fig. 5) can also be used, which comprises the same type of rigging shown as Fig. 3, except that it has the advantage of affording exact

HAND-BRAKE PRESSURES—FIG. 5—RIGGING EMBODYING SAME PRINCIPLE AS THAT SHOWN IN FIG. 4

equalization of pressures and the application of brake pressure to both trucks under all conditions.

When hand brakes are applied to air-brake cars it has generally been the practice to provide levers for multiplying the hand-brake power and a chain for operating the brake-cylinder piston, thereby applying the brakes to the trucks through the air-brake live and dead levers. By this method exact equalization of hand-brake pressure is obtained through the air-brake levers. However, some master mechanics favor a separate and independent brake rigging right to the truck levers. Their preference is based on good, sound judgment, as it not only provides against a failure of the air, but against the breakage of any of the air-brake pull rods. The practice of operating through the air-brake rigging, however, has the advantage of extreme compactness, and an additional safety measure has been provided by means of the stop device recommended by the Westinghouse Traction Brake Company. This device limits the travel of the live and dead levers in such a way that, should one of the top rods break, the lever can fulcrum against the stop, assuring a brake on at least one truck.

In designing hand-brake equipment and rigging for a car of known weight, it is desirable to obtain the maximum force possible in the hand-brake pull rod. Efficient hand-brake devices can be made very compact and can develop high power without the space required for the swing of long brake levers. For this reason the best proportion can generally be obtained by having the multiplying ratio transmitted through the car-body levers as low as possible, which results in short travel of the levers, the travel being directly comparable with the multiplying ratio. Economy of valuable space under the car is also thereby effected, allowing room for the many devices now being added to modern car equipment.

Effect of Gear Ratio on Operating Economy

In the sixth annual report of the Board of Supervising Engineers, Chicago Traction, the results of a study of a change in gear ratio are given. These results are shown in the accompanying curves. The study was made on a change in ratio from 69:17 to 71:15 on the standard 1908 Pullman car of the Chicago Railways, weighing 30 tons. Fig. 1 shows the characteristic motor curves for the two gear ratios, the efficiency being practically the same. On the assumption of an accelerating rate of 1.65 m.p.h.p.s. and different periods of coasting, the operating results obtained with the two

GEAR RATIO AND OPERATING ECONOMY—FIG. 1—CHARACTERISTIC CURVES OF CHICAGO SURFACE LINES MOTOR

GEAR RATIO AND OPERATING ECONOMY—FIG. 2—SPEEDS AND ENERGY CONSUMPTION WITH DIFFERENT COASTING PERIODS

gear ratio are shown in Fig. 2, the speeds given being running speeds with no allowance for stops. Assuming ten-second stops at intervals of 528 ft., or ten stops per mile, as typical of the service on heavy streets, the following results were indicated by the study:

1. With no coasting, a schedule speed of about 9 m.p.h. cannot be exceeded without increasing the acceleration rates assumed.
2. The maximum or crest speed of 20 m.p.h. is necessary to reach this average speed.
3. With part coasting and part braking, the relation between maximum and average speed is in general of the same character, i.e., with a given maximum of crest speed the schedule speed is limited and cannot be raised without increasing acceleration rates. Con-

GEAR RATIO AND OPERATING ECONOMY—FIG. 3—CURVES SHOWING RELATION OF STOPS PER MILE AND SAVINGS DUE TO CHANGE IN GEAR RATIO

sidering the present average schedule speed of Chicago cars, i.e., 9 m.p.h., it appears from the average curve of Fig. 2 that a crest speed of fully 18 m.p.h. must be reached and stops limited to five per mile or their equivalent as an average, if the rated capacity of the equipment is not to be exceeded.

In general, from the results of the study, it appears that the new gear ratio is better adapted for the heavy Chicago traffic under the assumed conditions for the following reasons: 1. The maximum crest speed of the cars is reduced by about 13 per cent. 2. A mean power saving of 6.6 per cent may be realized within the usual range of stops. This can be seen in Fig. 3, where the ratio of power consumption between new and old gearing is plotted against stops per mile. 3. The rate of acceleration on subnormal voltage may be materially increased without dangerously overloading the motors. This is particularly advantageous in the congested districts as a means of increasing schedule speeds.

The report also calls attention to the effectiveness of field control, the principal advantage of which is in providing a flexible gear ratio, changeable electrically

GEAR RATIO AND OPERATING ECONOMY—FIG. 4—TRAIN RESISTANCE CURVES USED AS THE BASIS OF PREVIOUS CALCULATIONS

through the operation of the controller. The gear ratio suitable for field control is given as 69:15, or 4.6, as compared with 71:15, or 4.73, for the revised rheostatic control, and 69:17, or 4.055, with the rheostatic control then in use.

In calculating the schedules on which the above conclusions are based, the board employed the results of resistance tests made by the Chicago Railways in 1912, using standard passenger cars and the dynamometer or drawbar-pull method. These results are shown in Fig. 4. The tests were made upon a car weighing 26½ tons empty and loaded to 35½ tons, that is, with 120 passengers. The curves represent the resistance at constant speed, it being found that during acceleration the resistance is considerably higher, especially at low speeds. The resistances shown are much lower than are usually given for cars of this type.

The formula representing them is based upon the Armstrong train-resistance formula with the constants revised to fit the results of these tests. It is as follows:

$$R = \frac{53.5}{\sqrt{W}} + 0.05 S + \frac{0.00877 \times A \times S^{1.7}}{W}$$

where R = car resistance at uniform speed in pounds per ton.

W = weight of car in tons.

S = speed in miles per hour.

A = head end area square feet (100 sq. ft.).

The report calls attention to the fact that there is general acceptance of a form of curve starting at zero speed with a certain static friction, and increasing more rapidly than the speed due to head or wind resistance and track friction. But none of the empirical curves for free-running train resistance recognize the fact that the resistance during acceleration is considerably greater than indicated by the curve of free-running resistance, and that the curve of total drawbar-pull or resistance is very high at the start, minimum at a moderate speed and again rises at higher speed. Hence in the preceding study the resistance during acceleration was assumed as high as $22\frac{1}{2}$ lb. per ton, nearly double that found in free running.

Although these data were obtained from actual dynamometer tests, the great diversity of opinion and results among various investigators suggests the necessity for further analysis, especially differentiating between train resistance during acceleration and during free running.

Effect of Car-Wheel Diameter on Motor Heating

In a recent publication of the Westinghouse Electric & Manufacturing Company appears a continuation of the discussion of the effects of the size of wheel on motor heating begun in a series of articles in the *ELECTRIC RAILWAY JOURNAL*, to which the writer referred. These articles appeared in the issues for Oct. 3, 1914, page 622; Oct. 31, 1914, page 1014; Nov. 28, 1914, page 1203, and Dec. 19, 1914, page 1344. After referring to the discussion in the *ELECTRIC RAILWAY JOURNAL* the writer of the article proceeded as follows:

As an example of the effects of differences in wheel diameter, the case of a car which has wheels 30 in., $30\frac{1}{2}$ in., and 31 in. in diameter, equipped with typical 37.5-kw. (50 hp.) motors, has been considered and will show the difference in the load and heating for each of the motors driving the three sizes of wheels.

From the speed curves, Fig. 1, the amperes load taken by each of the motors for any given speed may be easily determined. For example, if the car is operating at 15 m.p.h., the motor on the 30-in. wheel is drawing 75 amp., and the motor on the 31-in. wheel is drawing $81\frac{1}{2}$ amp.

From this difference we have constructed curve No. 2, Fig. 2, which shows the per cent difference in the loading carried by the two motors based on the amperes in the motor driving the larger wheel. Due to the difference in amperes taken by the motors there is naturally a difference in the heating resulting therefrom. Curve No. 1, Fig. 2, shows the per cent difference in the heating between the motors driving the 30-in. and the 31-in. wheels, based on the heating in the motor driving the 31-in. wheel. At 25 m.p.h., which is the approximate free running speed, this heating will be 5.5 per cent less in the motor driving the smaller wheel than in the motor driving the larger wheel.

When the car is accelerating, these motors will draw approximately 90 amp., and when the resistance is all

cut out of circuit, the speed will be approximately 14.5 m.p.h. Therefore, the load on the motor on the 30-in. wheel is 7.3 per cent less than on the motor on the 31-in. wheel, and the heating is approximately 12 per cent less. It may be seen from the shape of the curve that when the motors are heavily loaded the difference in heating may be very great.

Fig. 2 also shows the difference in the load and heating between motors on 30-in., $30\frac{1}{2}$ -in. and 31-in. wheels.

These curves were worked up assuming the motors had identically the same speed curves, but in commercial production, due to the variation of materials, machining, etc., the speeds of different motors may vary as much as 5 per cent.

If the motor which is mounted on the larger wheel rotates at a higher speed for the same amperes than the motor on the small wheel, then the difference in loading will be greater than shown on these curves.

If the service is such that the motor is accelerating during the greater part of the time, the difference in wheel size permissible will not be so great as when it is operating in a service which is largely made up of running at high speeds with few accelerations.

It is not the purpose of this article to state what wheel-size variation is allowable, because this depends entirely on the shape of the speed curve, and particularly on the service to which the motor is subjected. It is evident that when the motors are running comparatively cool a certain difference in heating between two motors on a car is not so objectionable as with the motors worked to the limit. This means, in general, that it is not so necessary to be particular with reference to wheel sizes where the motors are running cool,

WHEEL DIAMETER AND MOTOR HEATING—FIG. 1—SPEED CURVES FOR DIFFERENT DIAMETERS; FIG. 2—DIFFERENCES IN CURRENT AND HEATING

while with motors running hot it may be best economy to keep the wheel sizes very nearly alike.

The approximate curves shown are given merely as an aid in deciding for each individual case the maximum difference allowable.

A recent census of the trainmen of the Louisville (Ky.) Railway showed that the men had been in the service of the company as follows: Fifteen for more than twenty-five years; forty-one for more than twenty years; forty-seven for more than fifteen years; eighty-four for more than ten years; 385 for more than five years; fifty-five for less than one year.

A Convertible Car for General Service

The Burlington (Vt.) Traction Company has recently placed in service a type of convertible car that has numerous features of advantage for general service. The design is standard with the builders, the J. M. Jones' Sons Company, Watervliet, N. Y., and it is claimed that the car probably constitutes the nearest approach to a single universal type for surface operation that has yet been attempted.

The special features, aside from the fact that the design provides an open car in summer and a closed body in winter, thus eliminating double equipment, consist in the low window sills, the absence of wall pockets that ordinarily collect rubbish, the maximum seat length and aisle space, the low platforms, and the inclosed platforms, preventing accidents to passengers and conductors, whether used as a summer car or as a winter car.

For the Burlington car, the general dimensions are as follows:

Length over all	45 ft. 0 in.
Length over corner posts.....	32 ft. 0 in.
Extreme width	8 ft. 5 in.
Height from rail to trolley board.....	11 ft. 10 in.
Weight fully equipped	45,000 lb.
Seating capacity (exclusive of platforms).....	58

The car body is constructed upon a steel underframe with steel-plate girders at the sides. The side posts are made of ash, but the roof sheathing is of sheet steel. The interior finish, in general, is of cherry. The interior equipment includes AA-DT American sheet glass, Globe ventilators, Curtain Supply Company's curtains, Heywood Brothers & Wakefield rattan-covered seats, solid-bronze polished trimming, folding platform doors and steps with Consolidated fixtures, Consolidated buzzers and heater equipment with thermostatic control, and International registers. Taylor trucks with 4-ft. 10-in. wheelbase and 34-in. wheels are installed, and with these is a four-motor equipment of Westinghouse 101-B motors.

The detailed weights of the various pieces of apparatus that enter into the construction are shown in the following table:

Car body	17,500 lb.
Trucks	12,500 lb.
Motors	10,800 lb.
Brakes and control	3,000 lb.
Doors and steps	900 lb.
Heaters	300 lb.
Total	45,000 lb.

It will be noted from one of the accompanying illustrations of the car that there are no hand straps at the ends of the car, and that the longitudinal end seats are

INTERIOR VIEW SHOWING STATIONARY SCREENS IN WINDOWS

unusually short, seating only two passengers. The idea involved is that, by eliminating the hand straps, standees will move forward to a point where they can reach the handholds on the backs of the transverse seats, and in this way the ends of the car will be left clear for entrance and exit.

Tank Lifters for Small Oil Switches

Oil-switch tank lifters are a great convenience, particularly in stations where a large number of switches are installed, and although a tank with oil for a comparatively small switch is not especially heavy, the character of the load makes it somewhat cumbersome for one man to manage. The result of this is that often the oil-switch contacts are not inspected as regularly as they should be to insure the most satisfactory operation.

The tank-lifting arrangement, which is manufactured by the General Electric Company and illustrated on page 74, provides a very simple and easy means for lifting quickly an oil-switch tank either up or down through the entire distance between the switch frame and the floor. The lifter is made in two widths, one for single and the other for double-throw switches, and these widths differ only in the lengths of the three rods that join the two pairs of parallel operating arms, this being necessary owing to the differences existing in the dimensions of the tanks.

To fasten the tank lifter to the switch frame two hooks attached to the inner ends of the longer pair of

CONVERTIBLE CAR WITH SASH IN PLACE FOR WINTER SERVICE

operating arms are placed over the ribs of the switch frame, the operating arms are raised and the tank supports fitted under the tank. Then the wing nuts that secure the tank to the frame are turned to unfasten the tank, and the outer ends of the long arms are lowered to the floor. Finally two catches on the cross-rod between the inner pair of operating arms are released, and these arms are allowed to rise until the tank reaches the floor.

The tank supports are separate from each other and

VIEW OF TANK LIFTER FOR SMALL OIL SWITCHES

attach to the tank by continuations of the two equal sides of each strap-iron triangle, which are bent upward to fit over the rim on the bottom of the tank. Each support is removed from a tank by lifting an end of the tank a few inches from the floor and sliding the support from under.

To place the tank on the oil switch, the operation as described is reversed, the time required for the process being practically negligible.

All-Steel One-Man Car

Some months ago the Marshall (Tex.) Traction Company, as noted in the *ELECTRIC RAILWAY JOURNAL* for March 27, ordered three all-steel one-man cars from the Cincinnati Car Company on a forty-five-day guaranteed delivery. The cars left Cincinnati on the date agreed and are now in service on the Marshall Traction Company's line. They possess a number of unique features, prominent among which is the all-steel construction notwithstanding their small size.

The side girders are made of $\frac{1}{8}$ -in. steel plates to which the side sills of 3-in. x 5-in. x $\frac{3}{16}$ -in. angles are riveted. From the side sills pressed-steel channel crossings of $\frac{1}{8}$ -in. steel plate are supported and these carry the flooring. All body posts are formed from continuous steel tee bars $1\frac{1}{2}$ in. x 2 in. x $\frac{3}{16}$ in., these members extending from side sill to side sill and forming the roof carlines. Vestibule corner posts are made of No. 12-gage sheet steel pressed into a box section, and the roof is covered with No. 18-gage sheet steel riveted direct to the steel carlines. The outside of the vestibule below the sash is covered with $\frac{1}{8}$ -in. sheet steel pressed at the top to form the window sill, and the letterboard for both body and vestibule is also a $\frac{1}{8}$ -in. steel plate, both top and bottom being shaped to receive respectively the canvas molding from the roof and the top sash.

The floor of the car is formed of two layers of wood applied longitudinally with the car body, and the interior finish, such as sash, doors and molding is made of ash. Outside of this, however, the construction is of steel throughout. No headlining is installed, the roof being covered on the outside with 1-in. thickness of compressed cork that is cemented to the steel, the cork, in turn being covered with No. 8 canvas secured to a wooden molding on the letterboard and bound with $1\frac{1}{2}$ -in. beveled edge iron. The wainscoting below the window sills also is made from compressed cork 1 in. thick and cemented to the steel side plates, and is covered with 16-in. linoleum. The vestibule between the floor and the windows is sheathed in the same manner.

A prominent feature of the car is the very high grade of painting that has been followed throughout, this being in accordance with the Cincinnati Car Company's standard system. The smooth finish is especially noticeable in the white enameled ceiling shown in one of the accompanying views. This has eliminated abso-

EXTERIOR AND INTERIOR VIEWS OF MARSHALL TRACTION COMPANY'S ONE-MAN CAR

lutely any objection to the absence of headlining on the grounds of appearance, as the exposed carlines give an impression of panelling that is exceedingly attractive. An air space under the steel roof sheathing is, of course, made unnecessary by the cork insulation on top of the roof.

The car seats thirty-two passengers and is 33 ft. 5 in. long over all. However, the weight of the car body, complete with all details but exclusive of the car-body electrical apparatus and trucks, was guaranteed not to exceed 10,000 lb. Single Brill trucks are used, these weighing 6800 lb. when equipped with two Westinghouse 307 motors and double-end control. This gives a total weight of 16,800 lb. for the car.

The following equipment specialties were furnished: Consolidated electric heaters, Hale & Kilburn seats, Hunter destination signs, Pantasote curtains, Rico sanitary strap covers, and Peacock brake mechanism with Cincinnati ratchet and pawl. Combination ventilator registers and lamp fixtures, sash locks, weather stripping, push buttons, and sand boxes were supplied by the Cincinnati Car Company.

The car body is fully inclosed and of the double-end type, the car having been designed for one-man operation. There are, however, two sets of folding doors and a stationery step on each side of the vestibule so that the car is suitable for two-man operation in case this is desired. The doors are normally under the control of the motorman by suitable operating mechanisms, and a removable division rail is provided in each vestibule to separate the entering from the exit passengers.

The general dimensions are as follows:

Length over all	33 ft. 5 in.
Length over corner posts	21 ft. 6 in.
Height, rail to trolley board	10 ft. 9 in.
Extreme width	8 ft. 2 1/4 in.
Step from rail	15 3/4 in.
Step to platform	13 in.
Step to car floor	8 3/8 in.
Door opening between posts	3 ft. 11 3/8 in.
Width of seats	37 in.
Width of aisle	30 in.
Side post center	20 in.
Seating capacity	32
Size of wheel	33 in.
Wheelbase	8 ft. 6 in.
Total weight of car	16,800 lb.

Effect of Zinc Chloride on Timber Strength

Some interesting results of a study of zinc chloride as a preservative of lumber were presented recently in a thesis by Alfred H. Clarke, at the Massachusetts Institute of Technology, Boston. The author pointed out that the main objection to the use of the cheaper grades of pine for structural purposes is the susceptibility of such lumber to destruction by dry rot. The seeds of the rot fungi are microscopic and may exist unobserved in new wood. If they are left unhindered they may, under proper atmospheric conditions, develop rapidly and injure the whole structure of the wood and be disastrous to the building. The usual means of prevention is by filling the wood with a poison which destroys the food of the fungi. Zinc chloride, often used for this purpose, is cheap, easy of application, and efficient as a rot destroyer. Under ordinary conditions it has not been thought harmful, but it has also been argued that under the conditions of temperature and humidity that favor dry rot, the zinc itself may impair the strength of the timber.

The method followed was to treat small sapwood specimens with the desired amount of the salt by immersion in a bath of weak solution, then to consider and observe in fairly large sets the wood so treated for strength in various ways, moisture content, etc. Comparisons were also made with untreated wood. A temperature of 150 deg. Fahr. was maintained for several

days. The moisture content was found to be about the same in treated and untreated woods, but the breaking strength of the treated pieces was only 38 per cent of the untreated specimens. The tests indicated the desirability of further research along this line.

Tearing Up Pavement at 500 Ft. per Minute

Rooting up granite-block pavement between the rails at the rate of approximately 500 ft. per minute is the startling result obtained by the use of the pavement rooter invented by Charles H. Clark, engineer maintenance of way Cleveland Railway Company, and described on page 1346 of the ELECTRIC RAILWAY JOURNAL of June 13, 1914. The device consists of a heavy steel

VIEW OF ROOTER IN ACTION

plow casting mounted beneath a substantially built carriage which weighs complete approximately 11 tons. In the particular instance shown in the three accompanying illustrations, the total time required to set the plow in position for beginning the work, attach it to the motor car and plow up 1475 ft. of granite-block pavement between the rails was twelve minutes. The actual plowing time for this length of track was three minutes. Since this rooter accomplishes its work so

VIEWS OF TORN-UP PAVEMENT

quickly, pictures of it in action have been difficult to obtain. For the information of track and roadway engineers one need not dwell upon the saving in labor thus effected, only two men with the plow and the crew on the motor car being needed. Immediately after the pavement is torn up it is necessary for a small crew of men to make the street crossings safe, but this would be necessary in any case, hence this gang's time is not chargeable to the cost of tearing up the pavement.

Quickly Detachable Busbar Tap

The busbar tap shown in the accompanying illustration is one of the cable-connecting devices made by the Fargo Manufacturing Company which were mentioned in the *ELECTRIC RAILWAY JOURNAL* of June 26. This is reported to make a material current saving on account

COMPRESSION-TYPE BUSBAR TAP

of its positive contact, as it makes a practically welded joint, the tap wire being forced against the busbar with almost any desired degree of pressure. This is accomplished merely by tightening the screw nut which holds the tap wire firmly through the cone-shaped grips fitting inside of it. The connection naturally has great strength and it is very easily installed, eliminating any necessity for using solder or bolted clamps. It can be disconnected with equal facility so that the work of cutting out a transformer, for instance, can be accomplished in a couple of minutes. This ease in handling obviously makes the device a great money saver in both the central station and the substation. In fact, wherever electrical taps are installed either permanently or for temporary work, this form of connection can be used with invariable success.

Track-Trench Excavating Machine

One operation to complete the track trench ready for ties, rail and ballast, is the result obtained by a special type of excavating machine that is operated by the General Engineering & Constructing Company, Rockford, Ill. This was designed particularly for excavating street railway track trenches in any width up to 9 ft., and depths up to 36 in. may be excavated in one operation. A roadbed true to grade is easily regulated, the depth of the trench being controlled by the boom operator who varies the depth of the cut as shown by an indicator on the machine.

This indicator points to the true grade which is

TRACK-TRENCHING MACHINE—VIEW OF MACHINE IN OPERATION

TRACK-TRENCHING MACHINE—VIEW OF INTERVAL BETWEEN TRACK AND EXCAVATING GANGS

established by a line and stakes set beside the trench. During the process of excavation the machine will deposit the spoil on either side of the trench or cast it into dump wagons in the street beside the trench. The ability of the operator to regulate this machine to cut a trench true to line and grade, and at the same time leave the trench practically clear of loose material, makes unnecessary any leveling of the finished trench.

In a contract recently completed for the Rockford & Interurban Railway, a 20-in. trench, 8½ ft. wide, was excavated at a rate of approximately 500 ft. a day. The material removed was a sandy loam paved with macadam. Before beginning the excavation the track was removed from the street with jacks, and the trencher followed this work so closely and was in turn followed by the track-laying gang, that a maximum distance of only 300 ft. was left between the point where the old track left off and the new track began.

Experience with various kinds of materials has demonstrated that the machine will successfully and economically excavate any of the usual composite materials found in city streets. If the spoil is to be used again for ballast it may be cast on one side of the trench, leaving the other side clear for traffic and track operations. When only a part of the spoil is to be used for future work, that which is to be hauled away may be run into dump wagons as the work progresses. In case all the spoil is to be removed from the street, the waste time of teams is minimized as the wagons are loaded rapidly and continuously after the teams have been properly spaced. The continuous flow of excavated material from the machine to the wagon makes it possible to load the average dump wagon in about two minutes, and experience has shown that it is possible also to obtain about ¼ yd. more load per wagon with machine-loaded material than with material loaded by hand. In the two accompanying illustrations the excavating machine and the interval between the machine and the track-laying gang are shown.

The recent talk by H. C. De Camp, Cincinnati, to two groups of trainmen of the Louisville (Ky.) Railway, is the first of a series which Mr. De Camp will deliver during the year. No meetings will be held during the hot weather. The company will resume the educational work in the fall, when Mr. De Camp will discuss the equipment of the street car. Other speakers will be heard from time to time. The meetings will be held at irregular intervals, according to the plans which the company has announced.

News of Electric Railways

TOLEDO FRANCHISE CONFERENCE

The conference between the franchise committee of the City Council of Toledo, Ohio, and Henry L. Doherty and other representatives of the Toledo Railways & Light Company on July 2 was brief and as a consequence not much was accomplished. Another conference was arranged for July 7.

The tentative draft as it stood on July 2 provides that the municipal ownership ordinance, passed by a vote of the electors on Aug. 4, 1914, shall not be changed, altered or affected in any respect by the provisions of the new ordinance, nor shall the new ordinance be construed as replacing the municipal ownership ordinance. This ordinance, it is expected, will state that its terms may be exercised whenever the city is in position to purchase the property.

Section 7 of the new ordinance provides that the city may buy the company's property under the provision of the referendum ordinance, the value to be based upon an appraisal which shall be determined by arbitration. The city must give the company notice twelve months before it expects to exercise this privilege and the purchase is to be settled by a referendum vote. The right to purchase may be exercised within sixty days after a referendum election, if the majority of voters favor the purchase.

It was agreed that when a question arises in regard to the fare to be charged, the rate in effect at the time shall be continued until the matter is settled by a court of common jurisdiction. Attorney Thomas H. Tracy suggested that if it is found that the fare was not sufficient to meet requirements provided in certain sections of the franchise, the loss should be made up to the company. While the matter was not definitely settled at the conference on July 2, the committee seemed inclined to concede this contention. Mr. Tracy also insisted that questions of efficiency in operation should be left to arbitration.

ROCHESTER CONNECTING RAILROAD

The Rochester Connecting Railroad has applied to the Public Service Commission of the Second District of New York for a certificate of public convenience and necessity for its 2½ miles of line in the outskirts of Rochester. The company recites in its petition its connection with the Buffalo, Lockport & Rochester Railway, an electric line, which is also connected with the proposal to build a new international bridge across the Niagara River and to connect it with the Buffalo, Lockport & Rochester Railway by a new line from Niagara Falls to Lockport. The New York Central Railroad has objected to the granting of a certificate to the Niagara Falls and Lockport line. The eastern end of the Buffalo, Lockport & Rochester Railway, through the proposed Rochester Connecting Railroad, is to be connected with the Pennsylvania Railroad and the Erie Railroad at Rochester.

It was said at a recent hearing before the commission for a certificate for the western connecting link that this, with the new bridge, would give the Pennsylvania Railroad access not only to the rich territory of the Buffalo, Lockport & Rochester Railway, but also would afford a connection over the new bridge with the Canadian trans-continental lines. The project is backed by men prominent in electric railway affairs in western New York, including E. G. Connette, president of the International Railway, Buffalo, and the petition for the Niagara frontier link of the new road is supported by petitions of the local authorities, boards of trade, and prominent manufacturers. The New York Central Railroad in its opposition to the project maintains that the territory is already supplied, if not over-supplied with railroad facilities. It says that the present railroad bridges into Canada are of a capacity sufficient to care for the business of many years' growth, and that to allow competition in this territory would be ruinous to its own interests as well as to the business of the new road. A hearing has been held before the commission on the Niagara link and the question of the Rochester connection will be heard within the next few weeks.

THE CHICAGO ARBITRATION

Employees Complete Presentation of Evidence—Railway Begins with Testimony of President Busby

Day and night session are being held by the arbitrators selected to pass upon the differences between the Chicago surface and elevated railways and their employees. The employees completed the presentation of their case with the examination of President Mahon of the Amalgamated association. The railway opened its case with L. A. Busby, president of the Chicago Surface Lines.

The hearing of June 30 was largely devoted to taking the testimony of employees regarding wages and working conditions. With each witness counsel for the employees emphasized the point that one year of training was sufficient to warrant paying a motorman the maximum wage. One witness stated that he knew of no skilled trade where the men received the maximum wage in one year unless it was the hodcarriers. This witness said that hodcarriers worked only about eight months of the year and he was not sure that men of this trade received more pay than motormen. Joseph Riordan, a motorman on a supply car, contended that his duties were more difficult than those of a regular motorman. For that reason he should receive the same pay and be of the same grade as the motormen in the train service. In cross-examination, however, Mr. Riordan stated that most men who went from the supply-car service to the train service did not like the work and quit. According to the witness motormen on supply cars would not be credited with seniority when they entered the train service.

The examination of motorman Myles Callaghan showed that he had a split run, from 6 a. m. to 8 a. m., and then from 1.40 p. m. to 9.30 p. m. He admitted, however, that he could have chosen a run with fewer consecutive hours which would have paid as much as the one he had selected. Practically all the other motorman witnesses had objected to smoking on the platform, but Motorman Callaghan advised that he had not suffered. It was very easy to ventilate the vestibule. The witness admitted that the company purchased the uniforms of new men in cases of emergency, and that the cost of uniforms had decreased. Ten years ago the extra men averaged four days a week. At present they average at least five days a week. The men were permitted to select the system by which runs were picked.

Maurice Lynch, assistant financial secretary of the union, was examined regarding the speed of cars. He stated that this was computed from one end of the line to the other, and included delays. On a line of fifty runs, each run having ten trips, or a total of 500 trips, a minute taken off each trip would save the company 1500 minutes. Also, if one hour was required for a round trip on a three-minute headway, and the time was reduced to fifty-seven minutes the company would save four men, or \$12.80 a day. High speeds required greater alertness on the part of the motormen, took cars off the line, and threw men back on the seniority list.

Ordinary common sense, a little clerical ability and honesty were essential for a man to be a good conductor. Concerning unemployment in other trades, bricklayers worked about 75 per cent of the year, structural iron workers 75 to 80 per cent, plasterers 75 per cent, lathers the same, and steam fitters continuously. Trainmen in the street railway service could not work the entire year.

Lawrence D. Bland, editor of the *Union Leader* since 1905, presented a table of increases in the prices of articles of food since 1907.

On July 2, W. D. Mahon, president of the Amalgamated Association, outlined the history of the organization and the railway industry. More than 200 locals had contracts with the companies. He believed the responsibility of motormen and conductors was greater than that of any men in any other form of transportation. The financial statements of companies in the United States showed a steady increase in gross income. In 1902 one out of 18,000,000 passengers was killed, and in 1907 one out of 13,000,000. In the last three years in Chicago, twenty-two trainmen were

killed on the surface lines, and eight totally disabled. The industry owed the employees a living when they became too old for service. Mergers resulted in a reduction of the cost of management. In 1892 there were six companies in Chicago. Now there was only one. The reduction in the expense of supervision should make it possible to take better care of the men. The men were not properly provided for anywhere in the street railway industry in this country or Canada. The arbitrators should consider only local conditions. When Mr. Mahon had finished, counsel for the employees announced that he had completed their side of the case.

L. A. Busby, president of the Chicago Surface Lines, took the stand on July 5. He outlined his ten years' connection with street railways, and explained briefly the development of the graded scale up to 1909, when the present five-year spread was established. Mr. Busby introduced exhibits showing the average monthly wages of regular, extra and carhouse men for May, 1915, for all employees to be \$74.20 a month. With \$3.10 a month added as the cost of free transportation to the men, the general average of all men in the service was \$927.60 a year, with the average for high-rate men \$1,011.60 a year. Other statistical exhibits were introduced to show that Chicago conditions were better than those in other cities as regards fall-backs, pull-outs, turn-ins, accident report time, night cars and receiver's pay. An exhibit was also introduced showing that bonus and dead-time allowances cost the company 3,255,540 man-hours a year, or \$1,011,786. This resulted in the Chicago trainmen receiving the equivalent of 34 cents an hour maximum wage.

Exhibits introduced showed that the average fare per passenger ranged from 2.8 cents in Chicago to 4.96 cents in some of the Eastern cities. The purpose of the graded scale was to insure just recognition of increased efficiency, to reward the men for long years of service, and to keep them in the service. In connection with the graded scale, Mr. Busby introduced an exhibit showing conditions in other cities.

The graded scale had been adopted for Chicago school teachers and was in line with the apprenticeship courses required in other skilled trades averaging approximately four years. According to Mr. Busby 200 days a year was the average working time for carpenters, with 185 days of the year as the average working period for all trades. The average earnings per annum for outdoor trades amounted to \$785. The average wage in Chicago in all industries was approximately \$590 a year, and the average wage of all industries in Illinois ranged from \$588 to \$914 a year. Most of this information was taken from the census of 1910.

Mr. Busby said that 6546 new applications were filed within the past year. In addition more than 5000 men had been refused permission to file applications. Only 871 positions were available during the year. Chicago conditions did not warrant an increase in wages at this time. Operating expenses were increasing faster than the gross income. Between 1902 and 1912, the capital required to develop and carry on the industry increased 113 per cent. Other exhibits showing the per cent of increase in passenger receipts over previous years, the decrease in the last annual report and the decrease since Feb. 1, 1915, were introduced. Another exhibit showed the receipts, expenditures and divisible receipts per revenue car-hour as increasing prior to 1914, and decreasing since that time. Numerous other statistical exhibits showing the expenses of maintaining property and making renewals were also introduced. In 1912 46,380 accidents were reported, or 46.7 per million passengers. In 1913 these figures were 39,330 accidents, or thirty-five per million passengers. In 1914 there were 37,143 accidents or thirty-three per million passengers. During the first four months of 1915, beginning Feb. 1, the number was reduced to twenty-eight accidents per million passengers. This included accidents of all kinds as reported by the trainmen. This closed the testimony taken on the evening of July 5.

On July 6 Mr. Busby was cross-examined regarding wages and transfers. Counsel for the employees questioned him about the surface railways contract with the city, the original purchase price of the properties and the allowances on construction costs when work was done by company forces. Mr. Busby thought that the Cleveland Railway and New York subway ordinances were more favorable to the

companies than the 1907 Chicago ordinance. Mr. Busby received \$60,000 a year salary; Henry A. Blair, chairman of the board of operation, \$30,000 a year, and John M. Roach, adviser to the president, \$20,000 a year. Each of the other four members of the board of operation received \$2,500 a year. Counsel for the employees criticised the company for setting aside 14 per cent in cash for maintenance and renewals. Questions of depreciation, taxes and dividends paid by the surface railways were also touched upon.

William Weatherwax, general superintendent of transportation of the Chicago Surface Lines, followed Mr. Busby. In direct examination, he stated that men were promoted from the train service to responsible positions in nearly all the railway departments. He would rather not employ ex-trainmen because it was difficult for them to overcome their old habits. Mr. Weatherwax outlined his experience with the company beginning as a tow-boy in 1886. He compared old-time and present-day working conditions. Mr. Weatherwax thought that the five-year period was just right for a man to attain maximum efficiency. The request of the employees that all Sunday runs be eight hours or less was not practical. It would require the use of many men who would not have work on other days of the week. Mr. Weatherwax had not endeavored to increase the schedule speed, but found it difficult to keep the men from running in advance of the schedules.

MARKET STREET OPERATION, SAN FRANCISCO

Superior Court Judge Sturtevant granted a temporary injunction on July 6 to the United Railroads, San Francisco, Cal., restraining the city of San Francisco from operating municipal C and D line cars on the outer Market Street tracks below Geary Street. The court held that the city violated the contract with the United Railroads dated Nov. 12, 1912. No question of the usurpation of the franchise is involved, and municipal railways may still operate on Market Street the lines in operation prior to the 1912 agreement. This means that all passengers from the ferry to the exposition via Market Street must transfer. The court finds the municipal cars on the outer ferry loop so numerous that the United Railroads business is affected and excessive wear caused to the track and overhead construction. The judge states that his decision parallels the case of the Second Avenue Passenger Railway, Pittsburgh, involving the same principle. The United Railroads has been placed under a bond commensurate with the financial loss estimated by the Municipal Railway. Appeal to the Supreme Court is to be made immediately.

LATEST DETROIT PURCHASE DRAFT ACCEPTABLE

The Detroit (Mich.) United Railway, through President J. C. Hutchins, has notified the Detroit Street Railway Commission that the latest draft of the proposed agreement for the purchase by the city of the company's property within the one-fare zone is acceptable to the officials and will be presented to the stockholders on July 14 with a recommendation for acceptance. The letter to the commission also advised that upon acceptance by the commission of the contract the company would take steps immediately to procure the consent required of the trustees for the holders of the bonds to appear in the chancery court to fix the price of the property provided the contract is accepted by the electors. The commission accepted the contract and gave the company until Aug. 2 to obtain formal ratification by the stockholders and consent of the trustees of the bondholders to appear in the suit. In addition to the contract a number of city charter amendments must be prepared, and upon these agreement must be made by both parties.

In a letter to the commission, Mr. Hutchins repudiated the suggestion that the company's attorneys had endeavored to write anything into the contract "prejudicial to the city's interests," and stated that a similar allegation might be made against the city's attorneys. The company also wrote the commission to the effect that it would not accept the idea of having the grievances of the street car men's union threshed out before the commission, maintaining that the present method of arbitration is sufficient to take care of the matter. It is stated that Elihu Root will pass upon the agreement for the bondholders.

CINCINNATI TAX CASE

On the plea that the State is attempting to collect double taxes, the Cincinnati, Milford & Loveland Traction Company appealed to the Ohio Supreme Court on June 18 for an order directing the Hamilton County Court of Appeals to certify the record of the decision it recently rendered in favor of the State. This court decided that the company must list for taxation as its gross earnings all the sums collected by it, although under the terms of the agreement between it and the Cincinnati Traction Company it is compelled to turn over 3 cents out of every 5 cents from fares collected in the city to the Cincinnati Traction Company. As the Cincinnati Traction Company pays excise taxes on this portion of the receipts the interurban line holds that the construction of the law made by the lower court is incorrect.

The State Tax Commission has placed the value of the Cincinnati, Newport & Covington Light & Traction Company's property in Ohio at \$1,020,620, an increase of \$360,000 over 1914. This amount was fixed on the basis of the company's settlement with the Hamilton County authorities for the years prior to 1911, it is said. The question now arises as to whether the commission can add to the valuations for the years 1911-1914 inclusive. This has been submitted to the Attorney-General for a ruling. The increase grew out of a complaint recently made by Attorney R. S. Alcorn of Cincinnati.

QUESTION OF CONSENTS

Neither Cleveland nor Cincinnati may be able to push through certain contemplated extensions and improvements, requiring consents of owners of abutting property before October, if the Ohio Supreme Court does not convene in special session to render decisions on the cases that were argued on June 30 and July 1, since this tribunal has adjourned for the summer vacation. The cases were those of property owners on Euclid Avenue, Cleveland, between East Twentieth and East Fortieth Streets, and David L. Carpenter and other property owners on Reading Road, Cincinnati, who object to the extension of the Bond Hill line over their street.

Walter M. Schoenle, city solicitor, appeared for the city of Cincinnati and argued that the law requiring the consent of property owners to a street railway is unconstitutional and that a decision for the city would be of great advantage to all cities and towns of the State. Attorney Dinsmore, representing the property owners, asserted that the consent law is not a delegation of legislative power, as had been contended, but that it merely states conditions upon which the city may act.

The main question in the Cleveland case is whether the new charter adopted takes precedence over the State law, when there is a conflict between them. The charter provides that consents of property owners along the line of a proposed street railway track are not necessary. Law Director Stockwell represented the city and Attorney Harry J. Crawford represented the Cleveland Railway, while Attorney Wilbur Wilkin appeared for the property owners. Mr. Stockwell contended that the charter under the home-rule amendment to the constitution supersedes the State law.

Director Stockwell contends that if the Supreme Court rules against the city, it will have the right to build the track itself and lease it to the Cleveland Railway.

STATEMENT OF RAILROADS ON RAILWAY MAIL PAY

The committee on railway mail pay, representing 264 railroads, operating 218,000 miles of line, made public on July 3 a booklet entitled "What the Railway Mail Pay Problem Means to the Railroads." In the booklet the committee discusses the law dealing with the system of payment for mail transportation advocated by the Post-office Department introduced in the last session of Congress. This proposed law, known as the Moon bill, failed of passage, but the Postmaster General has announced that he intends to have it introduced again in the new Congress. In the opinion of the committee as set forth in the booklet, the defects of the present practice respecting the payment to

the railroads for carrying the mails can best be remedied by providing the following reforms:

1. That the mails be weighed, and the pay be readjusted, at least once a year on every railway mail route, instead of once in four years, as at present.

2. That the railroads be paid for the use and operation of compartment post-office cars—for which the present law allows no pay—on a pro rata basis with the compensation allowed for full railway post-office cars.

3. That the railroads be paid for, or relieved from, the duty of carrying the mails between railroad stations and post-offices.

The booklet contains the resolutions unanimously adopted at the meeting of railroad executives in New York City on May 20, last, at which 90 per cent of the mileage of the country was represented. These resolutions completely sustained the position of the committee on railway mail pay, and indorsed the remedies it has suggested. The resolutions also approved the suggestion of the committee that in its opinion the ultimate solution of the railway mail pay problem would lie in reference of the matter to the Interstate Commerce Commission, with full power.

PHILADELPHIA TRANSIT LOAN APPROVED

The Councils of Philadelphia, Pa., on July 1 by unanimous vote passed ordinances appropriating the \$6,000,000 transit loan to the Department of City Transit and authorizing Director of City Transit A. Merritt Taylor to let contracts and start work immediately on the Broad Street subway and the Frankford elevated. The ordinances allotted \$3,000,000 of the loan for each of these projects. Actual construction work on both projects will be started on Sept. 13. Mr. Taylor says that if there is no delay in making the loans available, the entire Broad Street subway can be completed in thirty-two months and the Frankford elevated road within two years.

Advertisements appeared in the Philadelphia morning papers of July 2 inviting bids for the construction of the section of the Broad Street subway which will extend from a point in Broad Street at the north side of the existing subway structure of the Market Street Elevated Passenger Railway north of City Hall to a point in Broad Street at the south side of the existing subway structure of the Market Street Elevated Passenger Railway south of City Hall. This section will pass diagonally under the westerly side of City Hall. Bids for this work will be opened on Aug. 16. The specifications call for actual construction to be commenced on Sept. 13, and for the contract to be completed within thirty months.

Advertisements were scheduled to appear in the papers on July 8, inviting bids for the construction of the foundations for the Frankford elevated line, between Callowhill Street on the south and Unity Street on the north. Bids for this work will be opened on Aug. 16. The specifications call for actual construction to be commenced on Sept. 13, and for the contract to be completed within eight months. Advertisements will appear in the papers on July 26 inviting bids for the construction and erection of the steel work for the section of the Frankford elevated line, extending from Callowhill Street on the south to Unity Street on the north. Bids for this work will be opened on Aug. 23. The specifications call for the erection of the steel work to be commenced on Dec. 1, 1915, and for the contract to be completed within one year.

On July 1 Mr. Taylor issued a statement in regard to the work which he concluded as follows:

"Now that the policy of the city of Philadelphia has been finally determined by formal action on the part of the electors and the municipal authorities, after three years of research and public discussion, with full knowledge of all relevant facts, I hope that all parties in interest will co-operate generously in expediting the completion of the much-needed facilities which have been authorized, and such additions thereto as will be necessary, to the end that Philadelphia and Philadelphians may enjoy the bounteous returns which they will gain in time saving, convenience and comfort, and from a wider field of opportunity which will result from the establishment and operation of adequate rapid transit facilities in Philadelphia on a proper basis."

The Mayor has signed the transit loan bills.

WAGES IN SPRINGFIELD AND WORCESTER

The employees of the Worcester (Mass.) Consolidated Street Railway and the Springfield (Mass.) Street Railway have ratified the wage agreement with the New England Investment & Security Company referred to in the *ELECTRIC RAILWAY JOURNAL* of July 3, page 34. The new wage schedule provides for the same daily rate of wages now paid conductors and motormen on the Springfield Street Railway, but hereafter all overtime will be reckoned on the basis of nine hours a day instead of ten hours a day, as was settled upon when the previous agreement became operative. The employees of the Worcester Consolidated Street Railway, who received a minimum wage of 23 cents an hour and a maximum wage of 28½ cents an hour, will receive a minimum wage of 25 cents an hour and a maximum rate of 30½ cents an hour for the first six months and a minimum of 25 cents and a maximum of 31 cents for the last six months under the new agreement. The agreement will expire on May 31, 1916.

The miscellaneous departments, which include messengers, freight handlers, yard men and other employees, exclusive of conductors and motormen, will all receive increases in wages. The messengers hereafter will receive conductor's wages, which will mean that instead of working on an hourly basis at 25½ cents an hour for a ten-hour day, they will receive \$2.85 for a nine-hour day, or an increase of about 6 cents an hour over the present rate. The platform men will receive an increase of 7½ cents an hour, with a reduction in hours. Instead of working a ten-hour day for \$1.92½, they will receive \$2 for a nine-hour day. All other departments classified under miscellaneous will get a nine-hour day, with an eight-hour day on Sundays and holidays. They will receive time and a half for all overtime work. It is estimated that 120 or more men of the miscellaneous departments will receive an increase in wages ranging from 5 to 37½ cents a day over and above what they receive now, not including the increase that is represented in the reduction of the working day from ten to nine hours.

Under the new management the wages of the employees of the Springfield Street Railway and the Worcester Consolidated Street Railway are practically equalized, the former still profiting by a small margin. The Worcester men receive a minimum of \$2.25 a day for a nine-hour day as compared with \$2.30, the present wages on the Springfield lines. They will receive a maximum of \$2.75 for the first six months of the agreement and \$2.79 for the last six months of the agreement, as compared with \$2.85, the maximum daily rate on the Springfield lines. They will still continue to operate on platform time, whereas the Springfield conductors and motormen will continue to operate under a day schedule. The Springfield employees, instead of receiving a minimum of 23 cents and a maximum of 28½ cents for overtime, will receive about 25½ cents an hour for the minimum schedule and about 31½ cents for the maximum schedule. This means an increase of 2½ cents an hour for the one-year men and an increase of 3 cents an hour for the three-year men.

KANSAS CITY-CLAY COUNTY SUIT

Nine of twelve jurors in the Jackson County Circuit Court gave a verdict on July 1 for \$1,500,000 damages to the Interstate Railway against the Kansas City, Clay County & St. Joseph Railway, the Wyandotte Construction Company, and the estate of George Townsend. The motion for a new trial will be heard on Aug. 2. If unsuccessful, appeal will follow. The Interstate Company, suing for \$2,000,000, alleged that the defendants had usurped a right-of-way, which two-year options received several years ago had kept alive. Some property owners testified they had not given consent as claimed by the plaintiffs to notation of renewal on options. One question involved was whether the plaintiffs had paid for any land, or had done the work required by law to preserve the charter rights. A similar suit by the Interstate Company against the Missouri River & Camden Company, a Townsend steam road project, was thrown out of court four years ago. Suit similar to the Interstate case had been filed against the Kansas City, Clay County & St.

Joseph Railway for \$200,000 damages by the Kansas City & St. Joseph Electric Railway. This suit was dismissed, and the Kansas City-St. Joseph Electric Railway joined the Interstate Company, alleging it had sold its rights to the Interstate.

CINCINNATI TRANSIT COMMISSION REPORTS

The Rapid Transit Commission at Cincinnati, Ohio, made its report to Mayor Spiegel on July 2. It calls for the construction of a line under what is known as Modification H of Plan No. 4 and locates the line from a point in Norwood, a suburb of Cincinnati, through the Duck Creek ravine, under Owl's Nest Park, skirting the bluff and Mount Adams to a point near the Pennsylvania Railroad station; thence over Pearl Street to Walnut Street, as a subway under Walnut Street to the canal, in the canal to St. Bernard and then through the open country to Norwood. The cost of the line, exclusive of power house, equipment, and damages to adjoining property, is estimated by the commission at \$5,717,849.

The commission says that the line should be built by the city according to the plan mentioned in its entirety and that the people should be asked to vote for a bond issue that will cover the cost. It is the opinion of the commission, however, that the line should be leased to an operating company. If no tenant is found in advance the city should operate the line in order to give the interurban lines an entrance to the business section.

The report contemplates a high-speed line over private right-of-way on the section between St. Bernard and Norwood as soon as the city is built up in that section and street crossings become dangerous. The commission recommends that land be purchased at once for that purpose. The opinion is expressed that the line would not earn its fixed expenses in the beginning and that the city should arrange to make this good in some way. The commission suggests that the proposed boulevard along the Miami and Erie canal be developed with the construction of the road. The subway should be open between street crossings, so that as much light and air as possible may be admitted to the cars.

The commission has been at work a year and has had the aid of George F. Swain, chairman of the Boston Rapid Transit Commission, Engineer F. B. Edwards, and Engineer Ward Baldwin, the latter having charge of the electrical phase of the proposition.

Mayor Spiegel has expressed disapproval of the plan, principally because it would provide excellent advantages to St. Bernard and Norwood, both of which have opposed annexation to the city. He says the western part of the city has been practically ignored by the commission. He also favors a wide street along the canal, instead of a boulevard. Mayor Spiegel said he would be in no hurry to act on the report, because such a large proposition should not be rushed through without due consideration. The report urged the appointment of a commission at once under the Bauer rapid transit act, so that the road may be built as soon as possible.

ARBITRATION OF WAGES IN RHODE ISLAND

The question of wages, about which the officers of the Rhode Island Company, Providence, R. I., and the representatives of the men have been unable to agree, will be arbitrated. A. E. Potter, president of the company, was quoted by the *Providence Journal* of July 2 in part as follows:

"We have agreed to arbitrate the wage question. We have reached a good understanding on all other matters, that is, the five demands made by the men. It is true that we offered the extra men \$1.50 a day. In fact, we even went further, as we agreed to give that sum to all such men who were required to report for duty. This was done in lieu of any arbitration on this particular point. At yesterday's conference I offered to grant without further arbitration such increases as the men asked for in their recent demands, providing the company received an increase of 2 per cent in its business month by month compared with the previous year. Likewise I assured them that I would recommend to the board of directors that they be

given the increase asked for next year, providing we received an additional increase of 2 per cent in our business. I do not know what action has been taken on these proposals."

Electrification of Short Oregon Line.—It is reported that the purchase of the Rogue River Valley Railroad by the Southern Oregon Traction Company, Medford, Ore., means the electrification of the Rogue River line for its entire length, 8 miles, which includes 1 mile in Medford, 5 miles between Medford and Jacksonville, and 2 miles to the brickyard, and the extension on West Main Street of the present line of the Southern Oregon Traction Company.

First-Aid Chests Required on Illinois Railroads.—The Illinois Legislature, which adjourned last week, passed a bill requiring all railroads to provide emergency chests for first-aid to the injured on all trains. The workmen's compensation act was also amended so that its provision would apply to transportation companies, and a third bill amends the public utilities act to permit railroads to give transportation to newspapers and magazines in exchange for advertising.

New Publicity Department for Barstow Properties.—W. S. Bartow & Company, New York, have started a new publicity department in charge of E. Burt Fenton, manager, an experienced newspaper man. For the present Mr. Fenton's headquarters will be in Sandusky, Ohio. The purpose of the new department is to distribute information of interest to the public concerning the various railway and lighting properties controlled by this company and bring the public into closer relations with these properties.

Mr. Moore Returns.—George Gordon Moore, well known through his activities in electric railway promotion in Michigan and his connections with the San Francisco-Oakland Terminal Railways, Oakland, Cal., has returned from Europe. When the war began Mr. Moore was invited by General Sir John French to visit France, and he was at the British army headquarters almost continuously from the outbreak of hostilities up to the time of his return to this country. It is said that Mr. Moore has the distinction of being the only American permitted to visit the English headquarters.

Question of Tunnel or Bridge in New York.—Chairman Edward E. McCall of the Public Service Commission for the First District, has sent a letter to the Board of Estimate and Apportionment, inclosing a report from Alfred Craven, chief engineer of the commission, upon the proposal made by the Board of Estimate that a tunnel under the East River at Sixtieth Street be substituted for the use of the Queensboro Bridge for the tracks of the new Broadway subway, to be operated by the New York Municipal Railway Corporation. The chief engineer prefers the use of the bridge in accordance with the dual system contracts rather than risk the delay which may follow a change in plans at this time. Commissioners J. Sergeant Cram and Robert C. Wood, however, favor the tunnel and have notified the Board of Estimate and Apportionment to that effect.

Pennsylvania Public Service Commission Appeals.—In declaring that it had no jurisdiction over appeals from the decisions of the Public Service Commission of Pennsylvania under the revised act of June 3, 1914, the Dauphin County Court has left nearly twoscore of such appeals from various business men's and improvement associations undecided with no apparent way of ever questioning these decisions in court. Under the act of 1913, the Dauphin County Court was named as the tribunal to hear all appeals from the Public Service Commission's decisions. When the act was superseded on June 3, the appeals were directed to the Superior Court with the proviso that they must be made within thirty days of the commission's decision. Some forty decisions had already been filed for argument in the Dauphin County Court, and when the first of these came up the court announced that it had no jurisdiction under the latest act. As more than thirty days have elapsed since the commission's decision, these appeals have no means of disposition. Several appeals have already been made to the Superior Court and at least one of these will question the constitutionality of the new legislative act.

Financial and Corporate

ANNUAL REPORT

Pittsburgh Railways

The statement of income, profit and loss of the Pittsburgh (Pa.) Railways for the year ended March 31, 1915, follows:

Gross earnings from street railway operations.....	\$11,670,091
Operating expenses:	
Maintenance of way and structures.....	\$1,183,427
Maintenance of equipment.....	733,076
Traffic.....	28,017
Transportation.....	4,384,329
General and miscellaneous.....	1,286,271
Total operating expenses.....	\$7,615,120
Taxes.....	438,082
Total operating expenses and taxes.....	\$8,053,202
Net earnings from street railway operations.....	\$3,616,889
Auxiliary operations:	
Gross earnings.....	\$143,532
Operating expenses and taxes.....	97,098
Net earnings.....	\$46,434
Total net earnings.....	\$3,663,323
Other income.....	112,833
Total income.....	\$3,776,156
Deductions from income.....	2,955,797
Net income before deducting fixed charges.....	\$820,359
Interest on funded debt.....	389,620
Interest on income debentures.....	330,739
Net income for the year.....	\$100,000
Surplus, April 1, 1914.....	636,982
Additions to surplus.....	6,984
Gross surplus.....	\$743,966
Deductions from surplus.....	116,692
Surplus March 31, 1915—per balance sheet.....	\$627,274

Although the territory served experienced a very severe industrial depression covering almost the entire year, the loss in gross earnings from street railway operation was more than offset by economies practised and reduced cost of power. A comparison of the results of 1915 with those of 1914 show a decrease in the gross earnings from street railway operation of \$112,769, or 0.95 per cent, the operating expenses having been decreased \$280,747, or 3.55 per cent. The result was a gain in net earnings of \$167,978, or 4.32 per cent. The operating ratio for street railway operation was 65.25 per cent in 1915 as compared with 67.01 per cent in 1914. The average passenger earnings per car-mile were 31.29 cents, as compared with 31.45 cents, a decrease in 1915 of 0.16 cent.

There was expended during 1914 the sum of \$1,453,061 for improvements, betterments and extensions, of which \$1,073,970 was charged to property accounts, and \$379,091 to a deferred maintenance account, to be amortized during the life of the property benefitted. In addition, there was expended by the maintenance of way department \$1,183,427 for ordinary maintenance of roadway, tracks, bridges and overhead construction. By improvements the fire-insurance cost for the year was reduced \$7,955. During the year the toll bridges showed an increase in receipts of \$4,875, or 20.19 per cent, and a decrease in expenses of \$1,065, or 7.24 per cent.

During the year the company received the one hundred low-floor motor cars mentioned in a previous report. Nearly all of these are now in service. The low-floor, low-wheel, side-entrance car has met with the approval of the public, and it has been very satisfactory in operation. Owing to the public educational program adopted by the transportation and claim departments, the accidents and expenditures for claims have been greatly reduced. All the employees, with the exception of the trainmen, have been insured under the group-policy plan of the Equitable Life Assurance Society.

The above information is contained in the annual stockholder's report of the Philadelphia Company, which controls the Pittsburgh Railways. This report states that during the year the Philadelphia Company caused valuations to be made of its transportation and distribution lines, service lines, regulators, meters and compressing stations by independent

engineers. After making due allowance for depreciation these were incorporated in the balance sheet to the extent of a total increase of \$12,556,441. The book values of the Philadelphia Oil Company, the Pittsburgh & West Virginia Gas Company and Equitable Gas Company shares were increased to represent more correctly the actual value. The company availed itself of the above increases to make a reduction of \$8,924,254 in the valuation upon its books of street railway and traction stocks and other reductions in gas values sufficient to make the total amount of reduction in book values \$15,774,052.

The report also contains the annual statement of the Beaver Valley Traction Company, showing in the main the following results: Gross earnings from railway operations, \$334,093; operating expenses and taxes, \$236,704; net earnings from railway operations, \$97,388; net deficit from auxiliary operations, \$4,262; total net earnings, \$93,126; other income, \$518; total income, \$93,644; deductions and fixed charges, \$96,132; deficit, \$2,488, and surplus on March 31, 1915, \$92,336.

NORTHERN ELECTRIC REORGANIZATION

Preliminary Details of New Arrangement—Plan Believed to be Satisfactory to All Parties

It is reported that the reorganization of the Northern Electric Railway, Chico, Cal., has been brought into concrete form. The new organization plan represents the perfected work of the attorneys representing the bankers' committee, the underlying bondholders' committee, the Spreckels interests and the Sloss trustees.

The general features of the plan are that a new railroad corporation will be created to acquire the properties of the Northern Electric Railway, the Sacramento & Woodland Railroad, the Marysville & Colusa Branch and the Sacramento Terminal Company, the latter subject to the \$150,000 existing mortgage. This new corporation will issue first income bonds in exchange, bond for bond, for the bonds of the Northern Electric Company, the Sacramento & Woodland Railroad and the Marysville & Colusa Branch, and it will issue second income bonds in exchange, bond for bond, for the bonds of the Northern Electric Railway. All the bonds will bear interest at the rate of 5 per cent per year.

The unsecured creditors of the present companies will receive, as security for their claims, second income bonds equal to 50 per cent of their claims. These second income bonds will be delivered to the unsecured creditors by the Sloss Securities Company, and will be the consideration which the latter company will receive for its participation in the plan and for its cancellation of various unsecured claims it now holds against the Northern Electric Railway amounting to more than \$1,000,000.

The new corporation will also create a first mortgage bond issue of \$500,000 for the purpose of raising sufficient money to pay for necessary repairs and replacements to the road, receivers' certificates, expenses, attorneys' fees, costs of litigation, preferred claims for labor or materials which have been ordered paid by the court, and expenses of reorganization.

Interest will be payable unconditionally on the first mortgage bonds from the date of issue, and after five years from date upon the first income bonds. During the first five years interest will be payable on the first income bonds only as and when earned by the new corporation. Upon the second income bonds the annual interest charges will be non-cumulative.

All of the stock of the new corporation will be placed in trust with the Union Trust Company of San Francisco for a period of five years, with the power of selling the same for not less than \$2,000,000. In case of such sale the money will be distributed pro rata among the unsecured creditors and those secured by second income bonds. While the stock is so held in trust, the trust company will vote a majority of the stock in accordance with the instructions of the first income bondholders.

It is expected that the complete reorganization plan will soon be submitted to the bondholders and the creditors for their final approval. Support for the arrangement from all sources is anticipated.

REASON FOR PUGET SOUND DIVIDEND CUT

A circular has been addressed by the directors of the Puget Sound Traction, Light & Power Company, Seattle, Wash., to the stockholders in regard to the reduction of the quarterly dividend on the preferred stock of the company to three-quarters of 1 per cent, as noted briefly in the *ELECTRIC RAILWAY JOURNAL* of July 3, page 38. The directors say:

"This reduction of dividend is due to a decrease in earnings caused by operation of jitney buses at a time when business conditions have been generally unsatisfactory. The jitney first appeared in the Puget Sound district in January of this year, rapidly increasing in number until in February and March there were about 700 in operation, resulting for a time in a loss in gross earnings to the company of more than \$2,000 a day. A careful study of jitney operation throughout the country gives every indication that such cars under fair and reasonable regulation cannot be operated permanently and profitably in competition with street railways. A gradual decrease in such competition is, therefore, to be expected and such decrease is already taking place in the Puget Sound cities, the number of cars now in operation being less than 400.

"It is the opinion of the directors that neither the business depression alone, nor the operation of the jitney alone, would have affected earnings to such an extent as to make the reduction of dividend advisable. The company is at present in a strong position financially, with a substantial cash balance and only a small floating debt. The directors believe that this position should be maintained. As the company has had but six months of jitney competition, and as under most favorable circumstances this competition will not immediately disappear, they feel the company's resources should be conserved through postponing the payment of a portion of the preferred stock dividend.

"A return of general business toward normal conditions, or a further reduction in the operation of jitneys, should warrant the resumption of preferred stock dividends at the regular rate. The preferred stock is cumulative and, therefore, any deferred payments must be made up before dividends are paid on the common stock."

DES MOINES RECEIVERSHIP

Emil G. Schmidt, president of the Des Moines (Iowa) City Railway, has been appointed receiver of the property by the Federal Court as a result of action by the bondholders of the company to protect their interests. The decision of the State Supreme Court that the company's right to operate in Des Moines ends on Aug. 22 is believed to have been nullified by this latest court proceeding. Franchise negotiations are continuing, however, and a franchise settlement is expected. The franchise rights of the company were already being contested for by the bondholders in the federal courts, and the receivership will enable the company to make much-needed improvements which could not be made before on account of the unsettled franchise situation. Mr. Schmidt says that the jitney traffic in Des Moines is showing a big decrease and is now on the point of vanishing, if the growing receipts of the city railway are a criterion. The validity of the new jitney ordinance, which has been attacked in the courts, is undecided. Previous reference to the default in bond interest and the franchise difficulty of this company was made in the *ELECTRIC RAILWAY JOURNAL* of April 17.

Augusta-Aiken Railway & Electric Corporation, Augusta, Ga.—The officers of the Augusta-Aiken Railway & Electric Corporation recently filed with the Secretary of State of South Carolina a certificate of increase in capital stock from \$1,500,000 to \$2,500,000.

Bay State Street Railway, Boston, Mass.—The directors of the Bay State Street Railway have decided not to pay any dividend at this time on the \$20,517,200 of common stock, practically all of which is owned by the Massachusetts Electric Companies.

Belvidere (Ill.) City Railway.—W. C. Foster, Rockford, Ill., representing interests of that city, has purchased at auction the Belvidere City Railway.

Camaguey (Cuba) Company, Ltd.—The stockholders of the Camaguey Company, Ltd., have approved a proposition

to give the Electric Bond & Share Company an option for ninety days on the \$1,000,000 of capital stock of the company at \$90 a share. Examinations of the properties will be made.

Cleveland (Ohio) Railway.—The State Tax Commission has fixed a tentative valuation of \$24,891,100 on the property of the Cleveland Railway. Although the company has refused to pay the amount of taxes demanded for the last two years because of the excessive valuation placed on its property, and has brought suit to enjoin the collection of the amounts claimed each year, the tentative figures show an increase of \$2,138,370 over the value fixed last year and about \$5,000,000 more than the company is willing to concede. Each year the company tendered a check for the amount of taxes it was willing to pay and each year this was rejected by the county treasurer. These amounts have been set aside for payment when the courts adjudicate the matter. The company has insisted that the commission make known its methods of fixing the valuation, but this request has been refused.

Grand Valley Railway, Brantford, Ont.—The offer by the city of Brantford of the sale of the Grand Valley Railway line from Paris to Galt for \$30,000 and electrification of the Lake Erie & Northern Railway from Port Dover to Brantford, has not been accepted by M. H. Todd, acting for the Canadian Pacific Railway.

Lake Shore Electric Railway, Cleveland, Ohio.—The directors of the Lake Shore Electric Railway have decided to use the surplus earnings in the development of the business instead of making further dividend disbursements at present. The power service of the company is being improved at considerable cost, but the changes are expected to reduce the cost of production materially and make it possible for the company to increase the business of this department. The first preferred stock of the company is a cumulative issue.

Norton & Taunton Street Railway Company, Norton, Mass.—Judge De Courcy in the Supreme Court has appointed Amos F. Hill, Lowell, as receiver of the Norton & Taunton Street Railway Company, until foreclosure proceedings are brought by the American Trust Company, trustee for the bondholders, on account of defaulted interest. The company is a consolidation of the Mansfield & Norton, Mansfield & Easton, Norton & Attleboro and Norton & Taunton street railways. On June 1, 1903, all were mortgaged to the American Trust Company to secure \$296,000 of 5 per cent bonds.

Pacific Gas & Electric Company, San Francisco, Cal.—The board of directors of the Pacific Gas & Electric Company has declared a stock dividend of 6 per cent on the outstanding common stock, payable with stock certificates for whole shares of new common stock and stock dividend warrants for fractional parts of such shares in two instalments, 3 per cent on July 15, 1915, and 3 per cent on Dec. 15, 1915, to holders of common stock of record on June 30, 1915. Previous reference to this declaration was made in the ELECTRIC RAILWAY JOURNAL of June 19.

Peoria (Ill.) Railway.—The Illinois Public Utilities Commission has issued an order permitting the Peoria Railway to sell \$115,000 of first and refunding 5 per cent mortgage bonds.

Southern Oregon Traction Company, Medford, Ohio.—The purchase of the Rogue River Valley Railroad, an 8-mile steam line, by the Southern Oregon Traction Company is reported.

Washington & Maryland Railway, Washington, D. C.—The Public Utilities Commission of the District of Columbia has authorized the Washington & Maryland Railway to issue \$66,200 of first mortgage thirty-year 5 per cent bonds at the highest price obtainable under such details of sale as may be approved by the commission. The proceeds are to be used to fund indebtedness for cost of construction and improvements now made and to provide working capital. In a previous decision the commission valued the property of the company, including working capital, at \$63,381 as of Aug. 15, 1914. The present debt to be funded is \$53,000, and in order that the total securities may not exceed the fair value, the outstanding capital stock must be reduced to \$10,360.

Western Ohio Railway, Lima, Ohio.—The Western Ohio Railroad was authorized by the Public Utilities Commission of Ohio to transfer its interurban property to the Western Ohio Railway and its electric light property at Sidney to the Standard Power & Equipment Company.

DIVIDENDS DECLARED

Bay State Street Railway, Boston, Mass., 3 per cent, first preferred.

Boston (Mass.) Suburban Electric Companies, 50 cents, preferred.

Brooklyn (N. Y.) City Railroad, quarterly, 2 per cent.

Honolulu Rapid Transit & Land Company, Honolulu, Hawaii, quarterly, 2 per cent.

International Traction Company, Buffalo, N. Y., 2 per cent preferred.

Kentucky Securities Corporation, Lexington, Ky., quarterly, 1½ per cent, preferred.

Ottawa (Ont.) Traction Company, Ltd., quarterly, 1 per cent.

Ottumwa Railway & Light Company, Ottumwa, Iowa, quarterly, 1¼ per cent, preferred.

Public Service Investment Company, Boston, Mass., quarterly, \$1.50, preferred.

Puget Sound Traction, Light & Power Company, Seattle Wash., quarterly, 75 cents, preferred.

Railway & Light Securities Company, Boston, Mass., 3 per cent, preferred; 3 per cent, common.

South Carolina Light, Power & Railways Company, Spartanburg, S. C., quarterly, 1½ per cent, preferred.

Springfield & Xenia Railway, Springfield, Ohio, quarterly, 1½ per cent, preferred.

Youngstown & Ohio River Railroad, Leetonia, Ohio, quarterly, 1 per cent, preferred.

Traffic and Transportation

THE JITNEY BUS

Philadelphia Regulatory Measure Signed—New Orleans Ordinance Sustained in State Supreme Court

On July 2 Mayor Blankenburg of Philadelphia signed the jitney regulation ordinance after it was returned to him by Councils with his amendment to the zone clause refused. The ordinance will become effective on July 12. In a statement the Mayor made it plain that he objected to the zone clause in the measure, but that he was opposed to permitting jitneys to operate unregulated all summer. Immediately after announcement was made that the Mayor had signed the bill, G. S. Winner, president of the Jitney Auto Service Company, said his organization would ask the Court of Common Pleas to grant a temporary injunction restraining the department of public safety from enforcing the provisions of the law. If this request is refused, he said, the company would appeal to the Public Service Commission for redress. John H. Fow, counsel for the Jitney Auto Association, also said he would file a bill in equity restraining the police department from enforcing the zone section of the ordinance.

The New Orleans ordinance designed to regulate jitney traffic was upheld on June 28 by the State Supreme Court, and a temporary injunction obtained in the Civil District Court by jitney owners to prevent the city authorities from enforcing the law was dismissed. Owners of jitneys objected principally to a provision of the ordinance which stipulated that all owners must give an indemnity bond of \$5,000. Each of the cars of the New Orleans Railway & Light Company is affected by the ordinance.

When the proposed ordinance regulating the jitneys in Scranton, Pa., came before Councils, a delegation of jitney owners asked Councils to define regular routes for them to travel on streets not occupied by the lines of the Scranton Railways, and offered to furnish the city with a blanket bond covering all members of the association. The offer was accepted.

At the request of the Pottsville (Pa.) Jitney Owners' Association, Judge Brumm has issued an injunction on Mayor Mortimer and the City Council preventing the enforcement of the jitney ordinance recently passed. The jitney owners say the new law is impossible of enforcement, as it requires a certificate of efficiency from all drivers, and there is nobody with authority to issue such certificates. They also charge that taxicabs exact large fares and are taxed only \$10 annually, while jitneys with 5-cent fares are taxed from \$25 to \$100.

City Solicitor Field of Baltimore, Md., has submitted to the Board of Estimate a tentative ordinance for the regulation of the jitney in that city. The measure fixes the license fee at \$200 for a car with a capacity of eight passengers or less, with an additional payment of \$25 for every passenger in excess of eight. A further tax of 9 per cent of the gross receipts is provided, this being at the same rate as the tax imposed on the earnings of the local railways for park purposes. The matter of an indemnity bond has not been covered in the measure as prepared by Mr. Field, as the Mayor believes that this could perhaps be dealt with better in a separate measure.

The jitney regulatory ordinance passed by the City Council of Grand Rapids on May 10 has gone into effect. The Council found that of the 3385 names signed to a petition presented by the jitney men for a referendum only 947 were qualified electors and the petition was promptly revoked. The ordinance provides for the payment of a license fee of \$3.50 for each passenger according to seating capacity. The bond for each driver is fixed at \$10,000. Jitneys are required to operate between 6 and 10 a. m., noon, 1 and 2 p. m., and 5 and 8 p. m.

Judge Leslie R. Hewitt of the Superior Court at Los Angeles, Cal., has sustained the city's demurrer to the suit of J. M. McClasky for an injunction to restrain enforcement of the motor bus ordinance. The ordinance became effective July 1, but the provision for \$11,000 indemnity bonds does not become effective until July 17.

JITNEY DECREASE IN OAKLAND

Careful counts made by the San Francisco-Oakland Terminal Railways of the jitney buses operating in Oakland, Cal., indicate a gradual decrease in the number of 5-cent auto vehicles. The craze began the latter part of December, 1914, and within thirty days approximately 500 machines appeared in the service. The need of legislation was quickly demonstrated. At that time jitney drivers were operating under a resolution passed by the City Council, permitting them to operate on a \$5 per annum license fee. The first formal ordinance, passed in February, 1915, added an indemnity bond of \$10,000 for each machine. Under this clause the jitneys have been paying a premium of \$80 to \$100 per annum to the Pacific Coast Casualty and the Guardian Casualty & Guarantee Companies. The latter company, however, has recently withdrawn from the field, gradually cancelling all bonds already written and refusing to write any new business. This ordinance also raised the city license fee from \$5 to \$60 per annum, payable quarterly; specified regular routes; called for a full stop at all railway crossings and other minor regulations under direct supervision of the chief of police of the city.

The ordinance was objectionable to the jitney operators, particularly the clauses in reference to the \$60 annual license fee and full stop required at all railway crossings. The City Council reconsidered the matter and passed a new ordinance which, while requiring the annual license fee of \$60, provided full stops at railroad crossings not controlled by flagmen or traffic officers and permitted operation over street railway crossings at a reduced speed of 5 m.p.h. This second ordinance was also opposed by the jitney operators on the ground that the \$60 license fee was exorbitant. An amendment was proposed to reduce this amount to \$10 per annum. This proposal was referred to a referendum vote by the people at the regular mayoralty election on May 11, and was defeated. The election at the same time approved an amendment making it obligatory upon the chief of police to revoke jitney licenses for violation of any part of the ordinance or any traffic law passed by the city.

The principal point now in dispute is between the city and those jitney operators who are operating under the original \$5 annual license fee. The city is endeavoring to collect the license fee under the new ordinance while the jitneys contend they are not liable to the \$60 tax until their original license expires. The city attorney has advised the Council that the right to increase the license fee is a legal one and the jitney operators received grace until July 1 to come in under the new license.

At present about seventy-five jitney operators are running under the original \$5 license fee which nominally expires on Jan. 1, 1916. They are preparing to contest the ruling of the city attorney through a case now pending in the lower courts, but with little encouragement for relief.

During the latter part of April 284 machines were licensed for jitney operation, but from actual count only 246 operated regularly during the week, except that on Saturdays due to increased travel and half-holidays, nearly all were operated. At that time the average earning per car was about \$4.25 per day, the longest route was 4.4 miles and the shortest 2.1 miles. In the latter half of May the total of machines licensed to operate had decreased to 270, but only 196 were in actual operation on week days other than Saturday. The greatest reduction was noticeable on the longest routes. By the middle of June the total number of licenses had decreased to about 200, which is accounted for by the rapid deterioration of machines, accidents, extraordinary wear, decrease in earnings and the apparent wearing off of the novelty as well as the usual loss of travel during the summer months on account of the absence of vacationists from the city.

Inquiry among jitney bus drivers indicated that no operators have made more than a living wage; also that a great many who are now running contemplate leaving the jitney field as soon as they are able to procure employment elsewhere. It was considered likely that many machines would be withdrawn from service under the provision for the renewal of licenses which was to go into effect on July 1.

THE PUGET SOUND COMPANY'S JITNEY SERVICE

A. L. Kempster, manager of the Puget Sound Traction, Light & Power Company, operating in Seattle, Everett, Bellingham, and Tacoma, states that preparations for installing jitney bus service in Seattle, heretofore reported in the *ELECTRIC RAILWAY JOURNAL*, are well under way, and that the first unit of fifty machines will be in operation in the very near future. Mr. Kempster said:

"Some of the machines are being operated temporarily in Everett, but they will be put on in Seattle as soon as we are in shape to handle the traffic. The first fleet will consist of fifty machines. We may confine the jitney system to that number or we may put on 200 more, just as there seems to be profit in a speedy short-haul business. No selection of routes has been made as yet, but it is probable that the Broadway and the Woodland Park runs will receive our attention first, as these seem to be profitable and much desired by the independent jitney operators. We are training our own men for the operation of our jitneys, and shall not accept anyone from the ranks of the licensed jitney bus operators. In this manner, we will find an outlet for certain labor not productive of profit now, and in addition we will be utilizing men whose records are well known to us and who have the fullest measure of our confidence. This will reduce the possibility of reckless driving, inefficient handling of traffic, or discourtesy."

The company contends that with a central repair plant, the ability to purchase supplies in large quantities, and other advantages that accrue through its well-developed organization it will make a better profit than is possible for the independent operators. According to the plans of the company, there will be no specially constructed bodies on small-car chassis, the company taking the stand that as soon as the attempt is made to carry a large number of persons in a jitney the element of speed, which is apparently one of the main desires of the traveling public, is lost.

SAN DIEGO TRAFFIC DECREASE

Division of Traffic Losses in San Diego Ascribes 62 Per Cent to the Jitney

Although it is the seat of the Panama-California Exposition, San Diego has suffered a slump in travel of all kinds due to the business depression. So far as the San Diego Electric Railway is concerned, the losses are enlarged by the still-unregulated jitney business. The company has made analyses of the jitney travel from time to time, and from these it has drawn the conclusion that about 62 per cent of the losses are due to this cause. The comparative figures for Sept. 1 to April 30, 1914 and 1915 respectively show a decrease in gross earnings from \$638,399 to \$625,847, or \$12,551, equivalent to 2 per cent. During the period of Sept. 1, 1914, to April 30, 1915, the jitneys carried about \$84,000 of business, while the hard times were held responsible for a loss of \$50,153. The latter two figures are based on comparisons of actual business and what the company expected with the normal annual increase in business up to May 1, the influence of the Panama-California Exposition has not become a determining factor in the company's revenues.

A count of jitney business at San Diego on May 29 for the eighteen hours from 6 a. m. to 12 midnight showed 2954 round trips, 7046 passengers, and \$352.30 in receipts. The average passengers carried per trip were 2.39. The total number of cars was 125, giving an average of \$2.82 per car. An ordinance regulating jitney traffic was passed by the Common Council on May 1, but its enforcement was postponed pending the service of a restraining order which expired on June 7. Since Jan. 1 the number of jitneys has averaged about 125. At one time as many as 200 men were engaged in jitney operation.

The company has lately adopted the plan of carrying its case to the public through a series of advertisements in the newspapers. All of the advertisements occupy large space and are directly concerned with problems growing out of the jitney competition. The subjects dealt with are indicated by the headings on the advertisements. Some of the headings in recent statements to the public follow: "Reduce Fares and You Break the Street Car Company," "Why

We Reduced Our Car Service," "Would the People Stand for the Jitney Bus if They Owned the Street Railway Lines?" "A Crippled Street Car System Is the Surest Way to Cripple a City," "Is the Jitney Competition Fair?" "Jitney Buses Make Hundreds of Men Jobless."

THE RECKLESS CHAUFFEUR

Vigorous Campaign of the Long Island Railroad to Inculcate Respect for Safety

The Long Island Railroad has inaugurated a campaign to induce chauffeurs and automobile drivers to be more careful when driving over grade crossings on Long Island. At prominent points on Long Island, where they cannot fail to be seen by those in automobiles, the railroad is placing huge signs which read:

THIS SIGN MAY SAVE YOUR LIFE TO-DAY

All the Precautions in the World Will Not Save the Lives of Those Who Drive Automobiles Recklessly Over Railroad Crossings

When Approaching a Crossing Please Stop, Look and Listen
We Are Doing Our Part. Won't You Do Yours?
LONG ISLAND RAILROAD.

The first of these signs has been placed at Broadway, Flushing, on the electrified division, where the railroad bridge crosses the highway. Some of the signs will be 50 ft. long and 10 ft. high, while others will be 10 ft. square. Several of them will be electrically lighted at night.

Not only is the Long Island Railroad putting up signs calling the attention of motorists to the danger of driving recklessly over grade crossings, but it is going to conduct an advertising campaign with a series of "life saving bulletins." These bulletins will make a plea for greater care on the part of drivers of motor cars on Long Island. There are still 631 grade crossings on Long Island. Up to date, 305 have been eliminated at a cost of more than \$15,000,000. At the present time, work on the elimination of thirty-two more crossings is in progress.

J. A. McCrea, general manager of the company, is urging upon the State of New York action similar to that taken by New Hampshire, which has just passed a law requiring every city and town to maintain a warning sign on every highway approaching a crossing at a reasonable distance on each side of the crossing. Under the New Hampshire act grade crossing protection is put in the hands of the Public Service Commission. That commission has ordered that enamel metal signs 24 in. x 12 in., white letters on a blue ground, shall be placed at varying distances from grade crossings. If any town for sixty days neglects to comply with the commission's order, it forfeits \$1 for each day. Anyone injuring or defacing these signs is liable to a fine of \$10.

Since 1911 there have been some 507 accidents at grade crossings on Long Island as the result of recklessness on the part of automobilists, motorcyclists, carriage and wagon drivers. In that period forty persons were killed and 111 persons injured, for none of which casualties the railroad company was responsible. Of the people killed twenty-four were in automobiles, twelve in wagons and carriages, and four on bicycles and motorcycles. Of the people injured sixty-seven were in automobiles, twenty-six in wagons and carriages, and eighteen included pedestrians, bicyclists and motorcyclists. In forty-two of the 507 grade-crossing accidents nobody was injured. In 157 cases automobile and wagon drivers defiantly ran their machines and vehicles through lowered gates, damaging the railroad's property to the extent of breaking the crossing gates. In attempting to cross the tracks 125 autos and fifty-three wagons were damaged. Some were struck by trains while others sustained damage by contact with lowered gates. From 1911 to June 17, 1915, a total of sixteen horses were killed and eight injured at Long Island grade crossings through the carelessness of their drivers.

J. A. McCrea, general manager of the Long Island Railroad, said on June 20:

"The Long Island Railroad management regards every accident as one too many, and it is now in the midst of an aggressive campaign to the end that life and property shall be preserved. If those who have occasion to use grade crossings on Long Island will co-operate with us, we shall succeed in accomplishing this distinctly humane object. Without their aid we must fail."

MILWAUKEE FARES

Pending the determination of the reasonableness of the original order by the Railroad Commission of Wisconsin commanding thirteen tickets to be sold for 50 cents by The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., the fare coupons given out by the company pending the Supreme Court Appeal will not be accepted for passage, according to J. D. Mortimer, president of the company. In a statement which he made Mr. Mortimer is quoted as follows:

"This company's investment in railway business is now earning so little as to make the expenditure of additional capital for further facilities absolutely impossible without obtaining some relief. Relief should take two forms—increased revenues and the cessation of hostile attacks on the business of the company. Both are necessary and the latter is as important as the former.

"When The Milwaukee Electric Railway & Light Company appealed from the decision of the Railroad Commission of Wisconsin, ordering the company to sell thirteen tickets for 50 cents, it was agreed by stipulation that the company should have the opportunity of contesting the reasonableness of the order, should the courts finally hold that the commission had the power to modify rates of fare prescribed by the company's franchise.

"The courts have now held that the commission possesses this power. Pending the determination of the reasonableness of the 'thirteen tickets for 50 cents' order, the fare coupons cannot be accepted in payment for transportation.

"Subsequent to the entry of the commission's order referred to, many things have occurred. The expense of the company of maintaining paving within the track zone has developed into large proportions. Requirements for increased service, resulting from special orders of the commission, have largely increased operating expenses. Opening of new lines and extensions of track, yet unproductive of appreciable earnings, have further reduced the margin which the commission believed to exist in the year 1912. General advances in prices paid for materials and labor have also increased expenses. More recently the advent of the jitney bus has reduced receipts without reducing expenses."

The decision of the United States Supreme Court in the Milwaukee fare case is abstracted elsewhere in this issue.

SAFETY FIRST IN BROOKLYN

The safety organization of the surface transportation department of the Brooklyn (N. Y.) Rapid Transit Company has presented its first half-yearly report, for the six months ended June 7. The report is signed by A. Maxwell, superintendent of employment, who is secretary of the departmental safety committee of the surface transportation department. In summarizing the results of the safety work to date Mr. Maxwell says:

"As to what bearing the net result of the safety movement to date has had on the accident situation is an interesting question. The monthly claim department accident statement for Classes A, C, D, and E accidents for the six months under review shows as follows in per cent, when compared with the corresponding period of the previous year:

Classification	Dec., 1914	Jan., 1915	Feb., 1915	Mar., 1915	Apr., 1915	May, 1915
Car collisions	—57.2	—32.1	—70.0	—35.5	—16.7	—53.1
Car and vehicle collisions	—32.9	—18.9	—42.6	—52.2	—21.2	—28.1
Cars striking persons	—43.1	—12.5	+43.1	+11.7	—4.9	—35.7
Boarding and alighting	—25.9	—2.4	—17.3	—0.7	Even	—21.7

"The prime reason for tabulating only the above four classes of accidents here is that these classifications more directly concern platform employees than any other class of accident, and, if statistics count for anything, these figures should reflect just what the men themselves are accomplishing toward minimizing and reducing our accident hazard.

"In conclusion it is believed that the safety movement of the surface transportation department has been fairly and successfully launched, and that, as time advances, what may now be described as an imperfect system will become a complete, harmonious and perfect system to the ultimate benefit and gain of the company and the community at large."

Curbing the Philadelphia Chauffeur.—The trainmen in the employ of the Philadelphia (Pa.) Rapid Transit Company have been asked to co-operate with the police of that city toward reducing reckless auto driving by reporting infractions of the traffic rules by chauffeurs.

One-Man Car Request Refused.—The Public Service Commission of Massachusetts has refused the request of the Milford, Attleboro & Woonsocket Street Railway for authority to operate electric cars in charge of one man on its lines between Cellingham, Four Corners and Caryville.

St. Louis Skip-Stop Hearing Concluded.—The hearing before the Public Service Commission of Missouri upon the request of the United Railways, St. Louis, for permission to eliminate 770 car stops was concluded on June 26. Attorneys were instructed to file their briefs within ten days.

Passes Withdrawn.—A bulletin has been issued by the East St. Louis & Suburban Railway, East St. Louis, Ill., in regard to free transportation. Mail carriers will hereafter be carried gratis only between 6 a. m. and 8 p. m. Deputy sheriff badges will not be honored, nor will the special agents of railroads receive free rides. Terminal Association agents will be carried free only on Eads Bridge. Policemen and firemen will be carried free only when they are dressed in full uniform.

Invites Manufacturers.—The Indiana & Michigan Electric Company, South Bend, Ind., is advertising in the Chicago daily papers, the manufacturing advantages of the St. Joseph Valley and the many attractions of South Beach, Elkhart, Mishawaka, Niles, Buchanan and other communities to manufacturers seeking smaller cities for location. Manufacturers are invited to submit their industrial problems to the Indiana & Michigan Company and the traction company promises co-operation.

New Detroit Interurban Station.—On July 1 the Detroit (Mich.) United Railway opened a new interurban station in Detroit. The ground floor is given over almost entirely to the uses of patrons of the interurban lines, while the remaining five stories of the building will be used for the general offices of the company. One of the features of the building is a wide gallery which has been fitted up as a ladies' rest room. The new office building and station is at Bates Street and Jefferson Avenue and was formerly the Edson-Moore Building.

Lexington Participation Plan.—All of the non-union trainmen of the Kentucky Traction & Terminal Company, Lexington, Ky., have accepted the contract proposed by the company some time ago, on the basis of an increase in wages proportioned on the saving made through any reduction in the cost of accidents. The union men have declined to accept the contract. They are reported to have drawn up a substitute contract which they will present to the company to replace the old one, which expires this month. The contract with the non-union men went into effect on July 1 for a term of three years. The general conditions of the participation plan were referred to in the ELECTRIC RAILWAY JOURNAL of June 19, page 1183.

The Memphis "Jim Crow" Case.—The Memphis (Tenn.) Street Railway has won its case in the courts in which its interpretation of the "Jim Crow" law was involved, the State Supreme Court having upheld the measure thus reversing the Circuit Court and the Court of Appeals. The case centered on the question of seats, two white men having entered a street car when there were plenty in the white compartment and having taken seats reserved for negroes. When the car filled up the conductor called upon them to give up their seats to negroes. They agreed to if he would get them seats in the white section. The upshot of the incident was that the conductor ejected the men and had them put under arrest, whereupon they brought suit for damages, getting an award of \$1,000 each in the lower court. The Supreme Court said in part: "These seats must be kept separate and apart; there should be a well-defined dividing line; blacks should be made to occupy their own seats and the whites theirs. Conductors have a sort of police power over passengers, and the latter are subject to orders from this officer, who must live up to the statutory provisions." The case was that of A. M. Keisker, and Ralph Bowden against the Memphis Street Railway.

Personal Mention

Prof. Charles M. Spofford, of the firm of Fay, Spofford & Thorndike, consulting engineers, Boston, and head of the department of civil and sanitary engineering of the Massachusetts Institute of Technology, has been appointed by the Governor of Massachusetts a member of the Terminal Commission, constituted by a recent legislative act to investigate the subject of terminal facilities and the improvement of facilities for the transportation of freight in the Boston metropolitan district.

Mr. Frank C. Rose has been appointed purchasing agent for W. S. Barstow & Company, Inc., New York, N. Y., engineers and manager for the General Gas & Electric Company and the Eastern Power & Light Corporation, which control among other properties the Rutland Railway, Light & Power Company, Rutland, Vt.; the Claremont Railway & Lighting Company, Claremont, N. H.; the Reading Transit & Light Company, Reading, Pa., and the West Virginia Traction & Electric Company, Wheeling, W. Va. Mr. Rose was connected with the Delaware, Lackawanna & Western Railroad for eighteen years, with J. G. White & Company for seven years as assistant purchasing agent and with the Foundation Company, Ltd., Montreal, for a year and a half as general purchasing agent. He succeeds Mr. F. A. E. Thorling as purchasing agent with Barstow & Company.

Mr. Fred F. Stockwell has been appointed treasurer of the New England Street Railway Club, succeeding the late Edward P. Shaw, Jr. Mr. Stockwell is widely known in the electric railway field as treasurer of the Barbour-Stockwell Company, Cambridge, Mass., manufacturer of special trackwork. He was born in Brattleboro, Vt., but his parents moved to Cambridge soon after his birth, and after attending the local schools Mr. Stockwell learned the machinist's trade in Boston. He entered business with a partner in 1889, and a consolidation of interests led to the incorporation of the Barbour-Stockwell Company in 1893. The new treasurer has been closely identified with the development of electric railway special work since the days of horse traction. He is a charter member of the club and is active in the American Electric Railway Manufacturers' Association.

Col. Timothy S. Williams, president of the Brooklyn (N. Y.) Rapid Transit Company, celebrated twenty years of service with the company and its constituents on July 1. On his arrival at his office on the morning of July 1 President Williams found on his desk a huge silver loving cup filled with American beauty roses—the gift of nineteen men of the company's official staff, whose service with the company has been coextensive with his own. The men who presented the loving cup to Colonel Williams were Messrs. G. H. Beck, E. Brower, T. S. Curley, J. H. Dwyer, G. H. Jackson, W. J. O'Neill, J. F. Throckmorton, J. Weidman, F. J. Spaulding, C. D. Meneely, J. H. Bennington, H. A. Crowe, J. Duffy, W. H. Gordon, A. Maxwell, W. Siebert, J. Walsh, Jr., C. T. Victorine, I. Isaacs. The loving cup is inscribed on one side with the names of the donors and on the other side bears the following inscription: "To our president and friend, Col. Timothy Shaler Williams, to whose wisdom, foresight and courage is so largely due the conception, nurture and development of the Brooklyn Rapid Transit System to its present proud pre-eminence, from those who have been associated with him for twenty years, who have to some extent shared his labors and who rejoice in his well-earned success."

OBITUARY

Joseph H. Pierson, assistant claim agent of the Terre Haute, Indianapolis & Eastern Traction Company, was killed when his automobile turned over on the evening of June 23, while he was driving from his office to his home at Valley Mills, a few miles south of Indianapolis. Mr. Pierson was born in Wayne Township, Marion County, Ind., in 1870. He was educated in the public schools of his native township and later took a course in the Central Normal College, Danville, Ind. He taught in the schools for several years. Mr. Pierson was active in Democratic politics for many years and was elected as representative to the 1909 session of the Indiana Legislature. He became connected with the claim department of the Terre Haute, Indianapolis & Eastern Traction Company in 1909.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Lauderdale Power Company, Florence, Ala.—Incorporated in Alabama to construct a railway between Florence and Huntsville, 75 miles. Alan Jemison, Birmingham, president.

Intercity Terminal Railway, Little Rock, Ark.—Incorporated in Arkansas to construct and operate a railway in Little Rock and Argenta. It is reported that the company has been organized to take over the Argenta Railway. Capital stock, \$500,000. Officers: C. C. Kavanaugh, president; E. W. Jackson, vice-president, and F. J. Schmutz, secretary and treasurer.

Mississippi Valley Railway & Power Company, Dover, Del.—Incorporated in Delaware to construct railroads and to operate by steam, electricity, or other power. Capital stock, \$4,500,000. Incorporators: Charles B. Bishop, Clarence J. Jacobs and Harry W. Davis, Wilmington, Del.

FRANCHISES

Phoenix, Ariz.—The Phoenix Railway has received a franchise from the Council to build a double-track line down Fourth Street from Roosevelt Street to Washington Street and to extend the Monroe Street loop to Fourth Street.

Los Angeles, Cal.—The Council decided on June 26 to advertise for sale a franchise for a street car track covering a distance of 448 ft. on Central Avenue in front of the Southern Pacific Station. The track is to turn in toward the station at a point 69 ft. south of Fifth Street and turn back to the present tracks at a point 448 ft. farther south. The track is desired by the Los Angeles Railway to provide for its passengers easier access to the station than is afforded by the present arrangement. The plan has been indorsed by the board of public utilities and the public utilities committee of the Council.

Los Angeles, Cal.—The Board of Public Works has been authorized by the Council to advertise for bids on the street railway franchise on South Park Avenue. Bids will be received on two sections of the line, the first extending from Jefferson Street to Slauson Avenue, and the second from Slauson Avenue to Florence Avenue.

Hutchinson, Kan.—The Hutchinson Interurban Railway has received from the Council a franchise to extend its line on Second Street from Main Street to a point 300 ft. east of Walnut Street. The Council also granted to the Arkansas Valley Interurban Railway the right to use the Second Street track for reaching its terminal station which will be located at 111 Second Avenue, East, recently purchased.

Pittsburgh, Pa.—In a recent letter to the Council Mayor Joseph G. Armstrong recommended that seventeen out of the twenty-five requests for franchises for curves, additional tracks and sidings made to him by the Pittsburgh Railways be granted. Together with this letter the Mayor submitted to the Council a proposed ordinance in which the conditions under which these franchises should be given were fully stated. The Mayor told the Council that he had prepared his recommendations after conferences with the law department and the Department of Public Works. He asked for immediate action on the part of the Council, inasmuch as conferences with the officials of the Pittsburgh Railways will probably be necessary.

TRACK AND ROADWAY

Birmingham, Ala.—In connection with the proposed electric railway from Birmingham to the Warrior River, it is planned to continue the line to Jasper, about 35 miles from Birmingham. W. W. Shortridge, Birmingham, is interested. [June 26, '15.]

Douglas (Ariz.) Traction & Light Company.—This company is constructing 300 ft. of additional trackage at Camp Douglas, extending the line eastward from its former terminus to a point near the eastern boundary of the Eleventh Infantry camp. It is later intended to extend the

trackage the entire distance to the eastern edge of the camp.

Hoxie Electric Railroad, Calico Rock, Ark.—Plans are being made to revive the project for an electric railroad from Hoxie to Calico Rock. J. W. Myers, Calico Rock, is interested. [Feb. 27, '15.]

Burlingame (Cal.) Electric Railway.—It is stated unofficially in San Francisco that the Burlingame Railway, owned by Ansel M. Easton, Burlingame, and others, will be equipped with the overhead trolley. The road, 2 miles long, has been operated since March 1, 1913, with storage battery cars.

Marin County Electric Railway, Mill Valley, Cal.—Construction has been begun on the first unit of this company's line. This stretch of track will extend from the heart of the town to the upper end of Cascade Canyon. It is expected that the system will eventually be extended to Sausalito. [May 22, '15.]

San Francisco (Cal.) Municipal Railway.—Bids will be received by the Board of Public Works on July 14 for steel rails to be used in the construction of the Church Street municipal railway. The city engineer plans to have the construction of the road contracted for in three parts—one from Van Ness Avenue and Market Street to Church Street and Eighteenth Street; another from Eighteenth Street to Twenty-second Street and the third from Twenty-second Street to Thirtieth Street. The plans for the section from Van Ness Avenue to Eighteenth Street will provide for the construction of two tracks on Market Street from Van Ness Street to Church Street.

Capital Traction Company, Washington, D. C.—The Public Utilities Commission of the District of Columbia has denied the application of this company to build an extension of its lines on Seventeenth Street, I Street, Thirteenth Street, H Street and other streets in Washington.

Orlando (Fla.) Interurban Traction Company.—W. C. Temple, president, reports that the project to build an electric railway to connect Orlando, Kissimmee and Sanford has been abandoned. [April 12, '13.]

Palatka-Hastings Interurban Railway, Palatka, Fla.—This company reports that the project to build an electric railway from Palatka to Hastings has been abandoned on account of the inability to secure permission from the Putnam County Commissioners to use the bridge crossing the St. Johns River upon a basis that would enable it to operate. F. J. Von Angelken, East Palatka, secretary. [Nov. 15, '13.]

***Pearl Harbor, Hawaii.**—Bids are desired until Sept. 18 by H. R. Stanford, chief of the bureau of yards and docks, navy department, Washington, D. C., for the construction of a marine railway at the naval station, Pearl Harbor, Hawaii, according to specification 2172. The appropriation for this work is \$94,000.

Lincoln Railway & Light Company, Lincoln, Ill.—This company expects to lay new track on Union Street from Broadway to Tremont Street. The 40-lb. rail now in use will be replaced by 60-lb. rail. The company has laid 80-lb. rail on its Broadway line.

Evansville & New Harmony Traction Company, Evansville, Ind.—This company announces that it has contracted with M. A. Peoples, Chicago, for the financing and construction of its line from Evansville to New Harmony, 30 miles. The line will connect a number of suburban towns in the vicinity of Evansville. It is expected that construction will be begun about Sept. 1. C. J. Seibert, Evansville, general manager. [Nov. 28, '14.]

Louisville & Northern Railway & Lighting Company, New Albany, Ind.—Complete suspension of traffic on Market Street between Washington Street and Vincennes Street has been ordered by the Board of Public Works, while the concrete bed for the new brick pavement is laid and allowed to settle, the railway company transferring passengers from car to car across the intervening square. The city and the Louisville & Northern Railway & Lighting Company are in a controversy as to the nature of a crossing which the company is to construct over Market Street. The city calls for T-rails embedded in cement between the tracks, and the railway wants to use oak planks.

Topeka (Kan.) Railway.—Material has been ordered and work will be begun at once on the extension of this company's line on Kansas Avenue from Seventeenth Street to Twenty-first Street. A bridge across the Shunganunga River will be built in connection with the extension. It is estimated that the bridge will cost about \$19,000.

Cumberland & Manchester Railroad, Manchester, Ky.—T. J. Vermillion & Son, Barbourville, have received the contract to construct a 3-mile section of this company's line from Manchester to Barbourville. The route extends via Cannon, Girdler, Hopper and Woollum. M. E. S. Posey, Barbourville, chief engineer. [June 19, '15.]

Brandon (Man.) Municipal Railway.—This company reports that it is constructing 6700 ft. of single track, forming a belt line 5½ miles long.

United Railways, St. Louis, Mo.—This company will construct new tracks on Olive Street between Fourteenth Street and Boyle Avenue, St. Louis.

***Rutherfordton, N. C.**—Plans are being considered to build a line from Rutherfordton to Columbus, about 15 miles. L. D. Miller, Rutherfordton, is interested.

***Dayton, Ohio.**—Plans are being considered to build a railway between Dayton and St. Marys. At a meeting of the citizens of the towns on the proposed line, held at Covington on June 30, Judge Dennis Dwyer of Dayton was appointed chairman of the committee to look after the financing of the line.

Oklahoma (Okla.) Railway.—Plans are being made by this company to reconstruct its tracks from the Rock Island Railroad tracks north on Broadway to Tenth Street and on East Fourth Street.

Sand Springs Railway, Tulsa, Okla.—This company contemplates the construction of an extension of its lines southwest to the oil fields, about 30 miles.

Northampton (Pa.) Traction Company.—Arrangements for the physical connection of the property of this company with the Northampton, Easton & Washington Traction Company across the Delaware River are under consideration and are expected to be completed in the near future.

Philadelphia, Pa.—Bids will be received until Aug. 16 by A. M. Taylor, director department of City Transit, 754 Bourse Building, Philadelphia, for the construction of the City Hall station section of the Broad Street subway under City Hall and Market Street subway and work appurtenant thereto, known as Contract 101. This section will be about 700 ft. long, and will include the underpinning of the west side of City Hall and the Market Street subway. Plans and specifications may be had at Room 748, Bourse Building, upon a deposit of \$50 per set, pending return.

Rhode Island Company, Providence, R. I.—Work has been begun by this company laying double tracks on North Main Street between Camp Street and Mill Street, Providence.

Southern Public Utilities Company, Greenville, S. C.—Material has been received and work will be begun at once on the reconstruction of this company's tracks on Whitner Street and South Main Street, Anderson.

Carolina, Greenville & Northern Railroad, Greenville, Tenn.—A. H. Jacoby, Greenville, has been awarded the contract for part of the work of this company's line from Bristol to Knoxville, via Kingsport, Newport and Sevierville, 140 miles. The maximum grade will be 1.5 per cent and the maximum curvature 10 deg. Three steel bridges aggregating 1500 ft. will be built on the line. H. S. Reed, 205 Grant Building, Los Angeles, president. [June 26, '15.]

Corpus Christi-Ward Island Interurban Railway, Corpus Christi, Tex.—Grading has been begun on this company's line from Corpus Christi to Ward Island, 7 miles. The work of laying track will be begun in about four weeks and it is expected that the line will be completed about Oct. 1. The company plans to develop Ward Island as an amusement park. J. H. Caswell, San Diego, is interested. [May 15, '15.]

Dallas (Tex.) Southwestern Traction Company.—At a meeting of the stockholders of this company on June 21 it was announced that the sale of \$60,000 of the company's \$2,500,000 of bonds has been authorized. E. P. Turner, Gaston Building, Dallas, president. [June 12, '15.]

Lynchburg (Va.) Traction & Light Company.—In connection with improvements being made by the city, this company plans to double track its line on Main Street.

***Norton, Va.**—Plans are being made to construct a railway from Norton to High Knobs in Stone Mountain, about 5 miles. Patrick Hogan, High Knobs, is interested.

Radford-Willis Southern Railway, Radford, Va.—The contract for constructing this company's line from Willis to Radford has been awarded to Williams Brothers Construction Company, Roanoke. John L. Vaughan, Shawsville, president. [March 13, '15.]

Virginia Railway & Power Company, Richmond, Va.—In connection with the proposed extension of this company's line on West Broad Street from Robinson Street to the corporate limits, officials of the company have stated that further extensions of its lines are practically at a standstill owing to the difficulty in securing the desired legislation, jitney encroachment and general depression. It is stated that at the present time the company finds it impracticable to build the line, and, as the time limit has already expired on the franchise, is prepared to avail itself of the alternative provision of forfeiting the \$5,000 bond which it put up as assurance at the time of securing the franchise.

Charleston (W. Va.) Interurban Railroad.—Four miles of track on this company's 25-mile extension from Charleston to Montgomery has been laid and it is stated that cars will be operated between Charleston and Malden, 6 miles above Charleston, by July 15.

***Morgantown & Wheeling Railway, Morgantown, W. Va.**—This company advises that it is extending its line from Cassville to Blacksville, 15 miles. All the grading and masonry is completed with the exception of one bridge 186 ft. long. The bridge is completed and ready to put in place as soon as it is reached by track. Seven miles of track have been completed and are being operated by steam. The company is using 70-lb. A. S. C. E. rails and oak and chestnut ties. It is planned to operate the line by steam for about two years, when it will be operated by electricity.

Weston & Glenville Electric Railroad, Weston, W. Va.—Surveys will soon be begun by this company on its proposed line between Weston and Glenville. Lloyd Rinehart, Weston, is interested. [Oct. 17, '15.]

SHOPS AND BUILDINGS

Connecticut Company, New Haven, Conn.—A new trolley station will be built at Woodmont by this company in the near future. The structure will be of stucco. The cost of the building is estimated at \$5,000.

Detroit (Mich.) United Railway.—On July 1 this company removed its interurban station and general offices to the Detroit United Building on the southeast corner of Jefferson Avenue and Bates Street. The waiting room is located on the ground floor with the main entrance on Jefferson Avenue, while the exit to the cars will be on Bates Street, as will also be the entrance to the general offices.

Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company, Minneapolis, Minn.—This company announces that it will soon begin the construction of general repair shops at Faribault, Minn.

Citizens' Traction Company, Oil City, Pa.—Announcement has been made by this company that it will erect a modern carhouse on the site of the present structure in Franklin. The building will have a frontage of 52 ft. on Liberty Street and will be 150 ft. deep. The structure will be of brick with concrete floors and rolling steel doors.

POWER HOUSES AND SUBSTATIONS

Pittsburgh (Pa.) Railways.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for four 1800-kw., 600-volt d.c., six-phase sixty-cycle, 514-r.p.m. compound wound commutating-pole rotary converters; twelve 625-kva. single-phase, sixty-cycle, 11,000-volt high-tension to rotary voltage low-tension O. I. S. C. transformers and one thirty-three-panel switchboard to control the above apparatus; also three 1000-kw., 550-volt, commutating pole d.c. generators with 1440-hp., three-phase, sixty-cycle, 10,000-volt, a.c., 514-r.p.m. synchronous motor generator sets with d.c. exciters.

Manufactures and Supplies

ROLLING STOCK

Southern Traction & Power Company, Alexandria, La., will probably purchase two or three cars.

Mobile Light & Railroad Company, Mobile, Ala., is expecting to purchase a number of single-truck cars.

Little Rock Railway & Electric Company, Little Rock, Ark., has ordered three buses from the Southern Car Company.

New York & Queens County Railway, New York, N. Y., noted in the *ELECTRIC RAILWAY JOURNAL* as expecting to purchase six double-truck cars, has ordered this equipment from the Southern Car Company.

Ogden, Logan & Idaho Railway, Ogden, Utah, has ordered six trailers from the American Car Company, St. Louis, Mo. This item is a correction of a note in last week's issue, in which the name of the contracting carbuilder was erroneously stated.

Connecticut Company, New Haven, Conn., noted in the *ELECTRIC RAILWAY JOURNAL* of May 15, 1915, as having issued specifications for ninety-two all-steel cars, has ordered forty-six cars from the Wason Manufacturing Company, and forty-six from the Osgood-Bradley Car Company.

TRADE NOTES

Automatic Ventilator Company, New York, N. Y., has received an order to equip with ventilators seven cars of the Union Electric Company, Dubuque, Iowa.

Q. P. Signal Company, Needham, Mass., has erected at Needham a new four-story brick and concrete manufacturing plant 103 ft. x 40 ft. The plant is completely equipped and will be ready for operation in about two months. Special power house apparatus and substation signal apparatus and trolley catchers will be manufactured in the new plant.

General Railway Signal Company, Rochester, N. Y., has received a contract to build a new interlocking plant at the crossing of the Illinois Traction System and Wabash, Illinois Central and Alton railroads at Pontiac, Ill. Work will commence at once and will be completed in ninety days. The plant will be all electric and of the latest type of modern construction, and will have eighty levers.

Universal Safety Tread Company, Waltham, Mass., is now manufacturing all types of its safety treads in its new plant at Waltham, Mass. All the machinery and shops have been moved from Groton, N. Y., where the treads were formerly manufactured, to Waltham, Mass. The new plant is completely equipped with lathes, presses, stamping and special machinery for the manufacture in all its processes of "anti-slip" and lead-filled safety treads used in the transportation and building industries.

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" headlights, has received an order for twenty-four SE-95 headlights from the Shreveport (La.) Railways. This makes a complete installation of this equipment by the Shreveport property. The company reports deliveries of this equipment during June to the following railways: Austin (Tex.) Street Railway; Atchison Railway, Light & Power Company; Chicago & Joliet Electric Railway; Helena (Ark.) Interurban Railway; Arizona Copper Company, Clifton, Ariz.; Sioux City Service Company; Scranton Railway; American Car Company for new cars of the Fort Dodge, Des Moines & Southern Railway; Wichita Railroad & Light Company; Pressed Steel Car Company for new cars of the New York, Westchester & Boston Railway; Des Moines (Iowa) City Railway; Hutchinson Interurban Railway; Denver & Interurban Railroad; Auburn & Syracuse Electric Railroad; St. John (N. B.) Railway; Windsor, Essex & Lake Shore Rapid Railway; Biddison & Crow Interurban Railway, Tulsa, Okla.; San Antonio (Tex.) Traction Company; Cincinnati Car Company for new cars of the Lancaster Traction & Power Company; Union Electric Company; Shreveport (La.) Railways; Seattle (Wash.) Municipal Railway; Trinidad Electric Transmission Railway & Gas Company; Hocking-Sunday Creek Traction Com-

pany; Wisconsin-Minnesota Light & Power Company; Georgia Railway & Power Company; Denver Tramway; Ephrata & Lebanon Traction Company; South Carolina Light, Power & Railways Company; Northern Texas Traction Company; Tarentum, Brackenridge & Butler Street Railway; Binghamton (N. Y.) Railway, and Topeka (Kan.) Railway.

ADVERTISING LITERATURE

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued a folder listing its various types of rolling stock and other railway equipment.

G. M. Gest, New York, N. Y., contracting conduit engineer, has issued a folder which contains a map on which are designated the various cities where he has completed contracts.

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued a price list of its second-growth hand-shaved hickory handles for use as axe, hammer, hatchet and pick handles in railroad work.

L. S. Brach Supply Company, New York, N. Y., has issued a catalog describing its types 36 and 40 vacuum arresters, mica shield protected, to meet the requirements of telephone train dispatching.

General Electric Company, Schenectady, N. Y., has just issued Bulletin No. 44,712, which illustrates and describes G-E lightning arresters for electric railway service, both in the station, on the line and on the car. This bulletin supersedes the company's previous bulletin, No. A-4135.

Tool Steel Gear & Pinion Company, Cincinnati, Ohio, has issued a folder on its tool steel gears and pinions, also a reprint from an article by T. C. Goodyer in the *Tramway & Railway World* which contains data showing the greater length of life of treated as compared with untreated gears.

Railway & Industrial Engineering Company, Pittsburgh, Pa., has issued advertising sheets describing and illustrating the Burke switching and protective apparatus, high-voltage air-break switches, horn-type fuses, improved horn-type lightning arrester and choke coil, and combination horn-type fuse and series horn-gap lightning arresters and choke coil.

Rail Joint Company, New York, N. Y., has issued an attractive catalog illustrating its continuous, Weber and Wolhaupter rail joints as applied to A. R. A. Series A and B rails, guard rails, frogs and switches, T-rails and girder rails. Illustrations are also shown of the different types of joints with fiber and with wood insulation, the "twin" insulated rail joint and the step rail joint.

Ohmer Fare Register Company, Dayton, Ohio., has issued a folder on its fare register system. The folder states that the *Denver Tramway Bulletin*, referring to the monthly list of conductors' Ohmer efficiency grades records that the general average for the entire system for April broke all previous records. This company has also issued an advertising blotter on its fare register system.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued in pamphlet form a paper entitled "Considerations in the Design of Railway Motors," a treatise on the ventilation of this type of motor, by R. E. Hellmund. This paper is a reprint of an article which appeared in the *ELECTRIC RAILWAY JOURNAL* of May 1 and also the *Electric Journal* and goes very thoroughly into this important subject. A large number of illustrations are used showing practice in ventilating motors, together with diagrams showing the air currents through the windings and cores of the armatures.

Electric Service Supplies Company, Philadelphia, Pa., has issued a general catalog on the Garton-Daniels lightning arresters. The catalog is divided into four sections, so arranged as to make easy the selection of proper apparatus for any set of conditions. Part I contains descriptions and price lists of a.c. arresters up to 20,000 volts, d.c. arresters up to 2400 volts, arc circuit lightning arresters for both a.c. and d.c. circuits, panel-board arresters, and lightning arrester cross-arm hangers. Part II contains a description and price lists on choke coils and disconnecting switches. Part III deals thoroughly with the subject of lightning phenomena as regards the construction and

operation of a.c. and d.c. arresters. Part IV contains valuable information accompanied with diagrams on the installation of lightning arresters, their grounding, distribution, and inspection.

Sangamo Electric Company, Springfield, Ill., has issued Bulletin No. 41, which describes and illustrates its "economy" electric railway meters, for use in aiding motormen to increase their efficiency by saving energy in operation. These meters are of two varieties, ampere-hour meters and watt-hour meters. They are both of the mercury motor type and therefore have all the advantages inherent to mercury flotation, the chief of which is immunity from damage due to vibration and shock. Through the use of these meters it is claimed that the motorman will take active interest in his car or train in that he will look for troubles and promptly report all defects for repair. The catalog contains tables and data concerning the use of these meters on the Chicago & Milwaukee Electric Railroad and shows the saving in power consumption per car-mile effected thereby. Testimonial letters from the Chicago & Joliet Electric Railway and the Rockford & Interurban Railway are also included which are significant in showing the saving brought about on these lines.

Trussed Concrete Steel Company, Detroit, Mich., has issued a comprehensive 128-page publication on its united steel sash. The book covers all the various types of sash with its applications in building construction. The first portion of the book is devoted to the general discussion of the features of steel sash construction, covering the questions of strength, weathering, workmanship, daylighting, ventilation, hardware, and glazing. The large variety of sections that are combined to make up steel sash are described in the next portion of the book, including among them the mullions. Standard pivoted sash is next thoroughly covered, including the horizontally and vertically-pivoted sash of all types. Continuous sash of the top-hung and center-pivoted type are comprehensively covered with numerous pages of details. Vertical-sliding sash represents the most recent development in steel-sash construction, and a large amount of space is devoted to the various types, including vertical-sliding sash with removable jamb guides, counter-balanced sash, counter-weighted sash and spring-balanced sash. Horizontal-sliding sash is also indicated at this point. Partitions and steel sliding and swinging doors are shown. The remaining portion of the book is devoted to photographic reproductions of important installations. One page contains illustrations of the attractive stations and shops of the New York, Westchester & Boston Railway where these windows are used. They are also shown in views of a paint shop of the Los Angeles (Cal.) Railway and a power house of the Philadelphia (Pa.) Rapid Transit Company.

NEW PUBLICATIONS

Proceedings of Sixth Annual Convention Pacific Claim Agents' Association, Spokane, July 9-11, 1914. 79 pages. Paper.

This book contains a list of the officers and committees of the Pacific Claim Agents' Association, and presents the running discussions, papers and reports before the convention in Spokane last year. A general index permits the ready finding of any desired information.

Human Nature and the Railroad, by Ivy L. Lee, published by E. S. Nash & Company, 620 Sansom Street, Philadelphia, Pa., 129 pages. Price, \$1.

Mr. Lee's easy style and analytical reasoning are well known through his contributions to the popular and technical press and his addresses before various bodies. The present volume is made up of ten of these addresses, and while they will be of interest and instruction to the general public because they tell the story of the railroad, they are equally of interest and instruction to the railway official because they explain to him his weaknesses and foibles, tell him the importance of telling the story and how to tell it as well as to live up to the story. The purpose, as explained by the author, is to establish a point of contact, to make the railroad manager, the employee and the public in their mutual relations understand one another's point of view. We hope that the volume will be widely read so that this wish will be fulfilled.

NEW YORK, SATURDAY JULY 17, 1915

No. 3

RETROGRESSION IN RATE MAKING

While we have all proper respect for the theory that administrative bodies should exercise constraint in interpreting "doubtful" provisions of law relating to their own powers, we believe that the Public Service Commission, Second District, New York, has no right so rigidly to interpret its enabling act as to rob it of one of its most progressive and constructive features. In declaring in the Ulster & Delaware Railway mileage case that it must be subservient to the old 2-cent statutory maximum rate fixed before commission regulation began in New York, it has reverted to the practice of inexperienced legislative domination which the commission law endeavored to destroy. The maximum rate was simply an ill-considered guide pending the installation of more scientific methods which the present regulatory machinery was intended to supply. While this should be self-evident, the point is strengthened by the facts that in Michigan the maximum rate law has been declared superseded by the commission law and that in New York since 1907 Governors have vetoed all rate bills as infringements on the powers delegated to the commissions. For a non-expert Legislature to force a commission to exercise discrimination so as to grant unlimited relief to the public and greatly restricted relief to the carriers, is a travesty upon the whole spirit of commission rule. Of course, if the Legislature wishes to resume its rate-making power, it can; but while commissions last, no super-technical nullification should be exercised against their potential usefulness in granting rates which they are convinced are just to carriers.

THE PURPOSE OF COMMISSIONS

We realize that it is not a popular thing for a commission to raise rates and so diminish the privileges which the public has enjoyed for a great many years. We believe, however, that the "unpopularity" which would result from such an action is more imaginary than real. In the first place, the public mind is prepared to accept increases in railroad rates with much more grace than it was a few years ago. There has been so much publicity on the necessity of higher rates that everyone now realizes that the expenses of operation of the railroad companies have increased, just as have the living expenses of individuals. Again, the public has a better recognition of the obligations of the railroad commissioners to grant such increases when they are justified. This view of the situation was well expressed in a recent address by Hon. J. F. McLeod, chairman Public Service Commission of Massachusetts. He said: "Capital honestly and prudently invested under economical and efficient management has a constitu-

tional right to a fair return, and the commission is under legal compulsion to allow such rate as will make that return possible. If an increase in fares is shown to be just and reasonable according to that standard, the commission has no discretion except to allow it." We agree with the sentiment thus expressed. The purpose of the appointment of a commission is to provide an impartial body with opportunities in the way of obtaining testimony on which the merits of the rate case can be judged. The testimony alone, and no outside considerations of popularity or unpopularity, should decide whether the rates are to be increased or decreased in any particular case.

SAFETY FIRST FEDERATION

An effort to correlate and perpetuate the general safety work now being conducted in different cities is the purpose of the Safety First Federation of America. For many years electric railway companies have been working out their problems largely unaided. When safety-first work began the railway companies were possibly surprised but certainly gratified to find that they would have willing associates among the public authorities, representatives of the public schools, chambers of commerce and individual, public-spirited citizens. While in many cities the initiative in the safety-first movement was taken by the local railway companies, it soon became, and properly, a community movement in which all of the interests already mentioned participated. In this form most important work has been accomplished, but there have been two points upon which some fear has been expressed in regard to the future. The first of these has been a question of the maintenance of interest in it. In all volunteer movements, after the first enthusiasm has passed away, there is danger that the interest in it will flag. This feeling was expressed in these columns some months ago under the heading "The Brass Band in the Safety Movement." The question raised was: How long-lived will a movement be which has no definite organization behind it whose sole purpose would be to keep it alive? The other point was in connection with the correlation of the work done in the different cities so as to get the most effective results for the least expenditure of energy and money. This meant a comparison of methods followed wherever safety-first work has been undertaken. These two needs, in brief, it is the aim of the Safety First Federation of America to supply. As with the movement in individual cities, it is not primarily a railway matter or even a corporation matter, and it is well that it is not so, but President Allen of the American Electric Railway Association has accepted the office of chairman of the trans-

portation committee of the federation so that the railway interests will be properly represented. A report of the first meeting of the transportation committee, which occurred this week in New York, will be found on another page of this issue.

THE TELEPHONE IN CITY DISPATCHING

Mr. Strong's article in the issue of May 8 on telephone dispatching at Rochester and the article in this issue on a similar system at San Antonio should help to promote wider use of this most rapid means of communication. If it is a good thing to be able to adjust schedules from day to day it is a better thing to adjust them from hour to hour and even from minute to minute. On the European battlefields of to-day we see millions of men moved about as easily as Napoleon maneuvered his thousands, and in no small measure is this due to the telephone. It is not enough to order a regiment to do a certain thing; it must be possible to change its orders almost instantaneously.

Car operation should be on the same modern plane. The schedule, for example, may designate certain cars as short-liners and others as through. Now, if a car is carrying a large number of passengers who want to go beyond the short-line terminus, literal obedience to the schedule will probably displease some of the passengers, especially in bad weather. Sometimes an inspector is stationed at the short-line terminus to decide whether or not the car shall go on, but with telephone dispatching in practice the crew could get instructions directly from the dispatcher. Contrariwise, a long-line or through car could be converted to a short-liner if it has no through passengers and when the dispatcher knows that the following car will go through in a few minutes.

Most deviations from the schedule, like those due to mass meetings, public concerts and ball games, can be provided for in advance; not so with large movements of people due to fires or other unforeseen events. Not long ago there was a big fire in a large Southern city. Had an effective telephone dispatching system been in use the local railway would not only have rerouted the affected car line more quickly, but would also have collected thousands of fares by running special cars to and from the fire. Instead, the jitneys got the business. The way the San Antonio Company dispatched and rerouted cars in accordance with the progress of a parade shows how readily the telephone permits the remodeling of a schedule.

It is hardly necessary to reiterate here the advantages of telephone dispatching as revealed by the detailed practices of Rochester and San Antonio. But the conclusion may be drawn that the telephone offers barely-appreciated opportunities to make the service flexible, thereby securing with one stroke more revenue and greater public satisfaction. The latter result, in fact, is seldom capable of attainment by direct means, but where every car crew, even in the farthest outlying districts, can notify the passengers in advance regarding unexpected operating changes, at least one prolific source of friction is at once removed.

COLLECTING TRAFFIC DATA

The latest article by F. W. Doolittle, director of the bureau of fare research, published elsewhere in this issue, is unusually valuable by virtue of its lucid presentation of the best practice in the work of collecting traffic data. From the experiences of individual railways and engineering companies that have made traffic surveys, Mr. Doolittle has collated basic information for all electric railway operators and has also added carefully-drawn distinctions in regard to the survey plans to be followed by companies of different sizes. Officials who desire for themselves or for their traffic survey staff a readable analysis of traffic survey procedure will find Mr. Doolittle's article replete with concrete suggestions.

In constructing his paper Mr. Doolittle develops his theme logically along the line of the items to be covered by a traffic survey, the frequency of their collection, the preliminary work, and the actual collection and the recording of data. The two points most interesting are in connection with the frequency of collecting data and the extent of the data to be taken. The frequency of traffic studies is impossible of exact determination on account of such factors as size of company, character and growth of territory, traffic density, business conditions and season changes, but sufficient generalization can be made on this topic to say that the time interval between collection dates should be short so that the company will keep pace with traffic fluctuations. The conducting of separate studies for the five ordinary week-days and for Saturdays, Sundays and holidays; the use of twenty-four hours as a minimum period of observation and the making of surveys by preference in the autumn and winter better to estimate peak conditions—these seem also to be becoming definitely formulated principles. It is more difficult to state the extent to which traffic count data should be accumulated, but we believe that Mr. Doolittle has outlined a feasible platform for the average comprehensive survey when he suggests in general the ascertaining of the average number of passengers getting on and off each car at every point during twenty-four hours in the case of the larger companies, the number of passengers getting on and off each car at important traffic points during eighteen hours for companies of medium size and the number of passengers on each car at the point of maximum loading during rush hours for the smaller companies.

It may be that some traffic experts will not agree entirely with this platform. The more one goes into the detail of Mr. Doolittle's article, the greater chance there is of finding particular practices which some experts may not like so much as their own. The science of making traffic surveys is still new to the transportation field as a whole, and through the kindness of local conditions individual initiative has had full sway in its development up to now. But Mr. Doolittle's article is concerned not so much with details as with general principles. Traffic survey principles are gradually becoming clarified and more widely accepted, and he who desires to understand the theory of such work should give the article a careful perusal. The technique to be followed,

however, in applying these principles to specific properties under the varying effect of local conditions and inherent characteristics is a problem to be worked out with all possible standardization by the men who are experienced in the multitudinous details of traffic surveys.

CONTACT SYSTEMS FOR HEAVY TRACTION

Never were there more interesting developments in progress in electric traction than at the present moment and in no place are these developments more interesting than in heavy electric traction. In this field one hears more about locomotives, cars, power plants and transmission lines than about contact systems, but the importance of the contact system was brought out in the railway papers and discussion presented at the A. I. E. E. convention, which were abstracted at length in last week's issue of this paper. While much of the discussion was taken up with routine construction and operation, one can read between the lines and note some very significant facts.

In the first place the phraseology of contact systems needs definition in order that the apparatus and its performance may be accurately and concisely described. The art is changing so rapidly that there is the possibility of adopting names for objects almost off-hand, that the words that are first perhaps thoughtlessly applied will remain. This would be unfortunate. In the early days of electrical development cases of this kind occurred, and expressions then coined have become so closely associated with the industry that it has never been possible entirely to get rid of them. The terms "booster" and "to boost down" are examples. In the present advanced state of the art, however, there is no excuse for the establishment of such barbarisms or their perpetuation.

It is further quite apparent that this is a trying-out period for heavy electric traction contact equipment. Broadly speaking, the system is entirely successful, but in detail there is much that is experimental. Steel contact wires are substituted for copper or phosphor-bronze contact wires, but it is found that they rust; rollers are supplied with wood cores and sleeve bearings, but later the cores are omitted and roller bearings are substituted. At the same time data of cost of operation are being accumulated, and if the operators and manufacturers will make these data fully available there will be ample compensation for the annoyance and expense accompanying the developmental work.

In the third place progress in this instance, as always, brings up new problems or old ones in new guise. Provision for voltage rises in third-rail conductors is one such problem. Readers of this paper have noticed several recent references to the subject. When a current in any circuit is interrupted the collapse of the accompanying magnetic field upon the conductors produces a voltage rise. This is more evident when there is magnetic material in the neighborhood of the circuit, as is the case with a third-rail conductor. Such voltage

rises add to the difficulties of design of high-voltage d.c. equipment.

Electrification has not as yet made serious inroads upon the steam railroad field. It will do so in due time. Meanwhile the present experiments with motors, contact systems, drives, etc., will make it possible ultimately to electrify a large system without danger of obsolescence losses like those incurred in the early street railway electrifications.

A REMEDY FOR THE NEWSPAPER YELLOW PERIL

The false public impression created by undeserved criticism from unscrupulous newspapers is difficult and often impossible for public utility companies to correct by mere improvements in service. Experience has shown, however, that the misrepresentation may occasionally be rectified by deflecting the editorial "punch" in another direction.

The president of a public service company in a medium-sized city recently related confidentially the experience of his company, which for a while found itself at the mercy of two local newspapers. One of them bitterly attacked its service, while the other stood up for it, putting it in a position somewhat like that of the ancient mariner when the two specters were dicing for his life. Though many of the attacks were unwarranted the company realized that some of them were justified. It accordingly remedied the defects of service and then, calling the hostile newspaper's attention to the betterments accomplished, requested it to give due publicity to them. The editor of the newspaper, however, frankly replied that retraction of its present propaganda would be impossible, for without such a resourceful means of opposing its local rival's policy life would become a bore to his readers and the circulation list would melt away. This answer was a hard blow to the company, but it presently adopted another plan. Through its influence a citizen's advertising club was formed for the purpose of attracting people and industries to the city. When the new plan was explained to the hostile newspaper, the latter, tickled at the thought of prospective subscribers from a city of increased population, at once discarded its toreador policy and backed the advertising club with enthusiasm. It even claimed to have originated the plan. The officials of the public service company smiled inwardly at this assertion, but were perfectly satisfied to allow the newspaper full credit because the latter's columns now glowed with notices of the special facilities afforded by the city, among which were mentioned an up-to-date street railway and a low-priced lighting system.

Whether newspaper criticism is just or unjust, so long as the criticism is sincere public utility companies may aspire to overcome its effect by adopting more progressive operating methods. If the motive behind the attack, however, is simply the idea that to keep attention attracted to it the paper must always be charging with head down at somebody, practically the only remedy, as in the above case, is to wave a red flag in a different direction.

Telephone Dispatching at San Antonio

The Flexibility of Schedules in Meeting Traffic Changes Has Been Greatly Improved—All Outside Men and Service Cars Are Also Controlled from the Dispatcher's Office

The San Antonio (Tex.) Traction Company has been using, since August, 1914, a telephone dispatching system with connections to forty-two street box dispatching stations. The equipment is of Western Electric manufacture installed and operated under lease by the Southwestern Telegraph & Telephone Company. The system is so arranged that in case of need any Bell telephone may be used.

The dispatcher's board is equipped with two private trunks which join it to the San Antonio public telephone exchange. The board also has connections to the traction company's commercial switchboard. The number of active plugs is now forty-two, with room for sixty. The telephones of all officials of the company are tied in with this board so that the dispatcher can get into touch with them at once.

The primary purpose of the board is, of course, the dispatching of cars, but the use of the telephone gives a much greater flexibility than would otherwise be the case, and certain other uses have developed as by-products.

The cars are dispatched by one man ordinarily, an assistant being employed only for meal relief and during the peak hours. The board is operated for the complete daily transportation period of nineteen hours. To enable two men to work together if necessary the board is divided into two sections.

CHARACTER OF SCHEDULES

The regular schedule calls for headways varying from five to fifteen minutes, according to the line and the time of day. However, conditions frequently arise which make it desirable to deviate from the regular headways. Practically all runs are of such character that the men report for orders on reaching each end of the run. In this way the dispatcher can give clearance orders to the men at frequent intervals or special orders if necessary.

A typical conversation is as follows: The dispatcher says: "Hello." The motorman then replies, "Car 317, Tobin Hill (the line), Otto (motorman)." The dispatcher then says, "9:15 a. m." (time of day). The motorman repeats "9.15," and the dispatcher closes with "O.K."

MAKING CHANGES IN SCHEDULES

The usefulness of the telephone in adding to the flexibility of the schedule will be apparent from the following instances:

Following rains it may be desirable to slow down the running time by adding say one minute on a fifteen-minute headway. This is readily accomplished by the time instruction which the dispatcher gives to succeeding cars at any given terminus. To guide each man he gives out the revised round-trip time and headway so that the car man can figure his new time-points accordingly.

Saturday and Sunday night service is left entirely to the dispatcher, through the road inspectors, as to when it is desirable to pull off or add cars on any line. The inspectors merely telephone the load conditions to the dispatcher, who acts accordingly.

The convenience of the telephone for setback operation is illustrated by a condition which arose on the West End line on Thursday, May 13. The street was

being paved at one end of the line, and many delays were caused by the use of temporary track and the congestion of foreign vehicles which could use no other place but the track. All cars were made equally late. As the schedule headway was fifteen minutes the cars were set back a half-space, or seven and one-half minutes, at 5:37 p. m. and another half space at 7:22 p. m. Of course, the same result would have been accomplished with one full-space setback at 5:37 or perhaps at 6:07, but this would have caused all cars to drag the line at the period of heaviest riding. Consequently, the half-space setback was used, as described, the second half-space being made when traffic was not so important. On other like occasions the conditions before the first setback have been restored by later advance of the same amounts of time.

The most frequent source of delay is due to the breakdown of foreign vehicles where only one car is affected. In cases of this kind the delayed car is generally allowed to proceed until caught by the car fol-

TELEPHONE DISPATCHING—BOARD IN USE AT SAN ANTONIO, TEX.

lowing. When this occurs the car with the least passengers transfers its load (usually to the car ahead) and turns back at the last meeting point. When it is impossible to turn back both cars because of a heavy load on each, the cars are permitted to go to the end of the line, and a special car, designated a "pull-out," is taken out of the car station to fill the gap in town and to the opposite end of the line. It may be added here that all San Antonio lines are routed from one side of the town through the business district to the opposite side of the town. The lines are not necessarily true radii, as they make several bends in their course, especially in the business district.

Still another schedule feature of telephone dispatching is the conversion of short-line cars into full-run cars when load conditions unexpectedly demand it. As soon as such cars have been ordered to proceed to the end of the line, the dispatcher orders out additional cars to maintain the original headway on the short-line section.

Another field for the telephone is found in the ease of securing additional transfers, tickets or change if the conductor runs short. The conductor telephones his wants to the dispatcher advising when his car will pass

TELEPHONE ACCIDENT REPORT
RECEIVED FROM TRAINMEN

of accidents thus obtained permits representatives from the executive office to get to the scene of trouble at once. Minor accidents involving only slight damage to property are not reported until the car reaches the terminal.

One interesting feature of the company's accident practice is that the conductor is frequently ordered to remain with the injured person. In the meantime the motorman handles the car alone to the end of the trip, thereby avoiding car blockades and delays to passengers.

One "trouble shooter" and one traffic inspector are always on hand at the main office to take care of contingencies.

REPORTS FROM INSPECTORS

The dispatcher also keeps in regular touch with the road inspectors who must report their whereabouts to him at least once an hour, oftener if possible. The dispatcher from these calls plots squares showing when an inspector reported from a given line. By glancing at the sheet one can readily see whether the inspectors are spending too little or too much of their time on given routes. Of course, the fact that the inspectors report at frequent intervals enables the dispatcher to assign any of them to special service. A typical example of the use of inspectors is afforded by stating the conditions under which they were employed to supervise traffic during the "Battle of Flowers" week in April. In addition to the usual number of inspectors in the downtown district, special men were placed at five important corners where telephones were installed to keep the dispatcher in touch with the location and progress of parades; also to keep the regular inspectors

q u a r t e r s . T h e s u p -
p l i e s a r e t h e n d e l i v -
e r e d b y m e s s e n g e r s .

TROUBLE REPORTS

The telephone is also used by the trainmen to report not only on car troubles but also on line and track defects. These matters are handled on standard forms which show the disposition made by the dispatcher and by the department concerned.

A still more important form of report, which is reproduced, is that relating to accidents. The almost instantaneous knowledge

[illegible]

TELEPHONE DISPATCHING—RECORD OF CONDUCTORS' REQUESTS FOR SUPPLIES RUN SHORT

advised of the dispatcher's orders concerning the shifting of routes and the turnbacks made necessary by the parades. This made it possible to keep up continuous service to the very last minute and to resume it as soon as possible.

SERVICE GANGS AND CARS

Contact with the line and track workers in the field is also greatly improved by means of the telephone dispatching system, mainly by requesting trainmen to deliver certain messages to the workers along their route.

Even the sand car is dispatched by telephone, as it can thus be used to the best advantage as reports on track conditions may indicate. The wrecker also reports to the dispatcher for orders immediately after clearing up any job in hand. In general, all service cars and gangs are subject to telephone control.

OTHER BENEFITS

The telephone dispatching system has not only effected the improvements in service noted but has also been of value to the general public in other ways. It has facilitated especially the handling of lost articles. Again, in the case of flooded track, it is now possible to answer inquiries more quickly and more intelligently than before so that patrons will know just how they can best reach their destinations in the absence of regular routing facilities.

The Galesburg (Ill.) Street Railway has opened Highland Park, near that city, to the public. Amusements for children received special attention. The park is equipped with a large dining-room for banquet purposes. At Highland Lake, adjacent to the park, the company has developed attractive swimming pools, chutes and springboards. The Galesburg *Daily Mail* spoke editorially in a very complimentary manner of the public work which the company is doing and urged out-of-town shoppers to plan picnics in this park as a part of their sight-seeing while in Galesburg.

The Collection of Traffic Data

The Items to Be Included and the Method and the Frequency of Their Collection—Preliminary Work,
Length of Period of Observation and Data to Be Taken in the
Field—Conclusions to Be Drawn

BY F. W. DOOLITTLE, DIRECTOR BUREAU OF FARE RESEARCH, AMERICAN ELECTRIC RAILWAY ASSOCIATION

The frequency and the regularity with which traffic studies were made in the past varied considerably. In 1910 information from twenty-four companies indicated that eight made such studies daily, three twice per week, three once or twice per month, two upon complaints, and eight at irregular and indefinite intervals. A report¹ made at that time suggests the following factors which may be said to control the frequency of such studies and the seasons at which they should be made:

1. Size of the property.
2. Character of the territory served.
3. Rapidity of its growth.
4. Density of traffic.
5. Business conditions.
6. Season changes.

The report further points out that in order to secure full advantage of fluctuations in traffic and to anticipate public complaints the interval between such studies should be short. In this connection it is of interest to quote the following two paragraphs:

"*Passenger counts.*—That there should be periodical developments of records of passenger traffic with comparatively short intervals intervening."

"The committee wishes to recommend that all member companies make daily records of passenger business by trains in interurban operation, feeling that such records are necessary statistics, not alone for proper construction of schedules and time-tables, but as well for the purpose of comparison with past results (the 1910 report shows eighteen companies out of fifty-seven making such a comparison) and as essential factors in developing estimates of future operation."²

Since traffic conditions vary not only with the seasons of the year, but also with the days of the week,³ many who have studied the matter believe that it pays to make a separate traffic study for week days, Saturdays and Sundays, since the termination of even a small part of the service and for a short time only may mean the saving of many car-miles. Touching on this matter, C. M. Larson says:⁴

"Such a record is necessary for week days, for Saturdays, and for other seasons of the year when the traffic is not of the same magnitude. There are, of course, variations in traffic due to weather conditions. These can usually be determined by general observations and the necessary steps taken for the required variation in the service."

In a paper presented in March, 1914, before The Milwaukee Electric Railway & Light Company's section of the American Electric Railway Association on "The Purposes of a Street Railway Traffic Survey," E. J. Archambault says:

"The traffic count that is carried on in an extensive

manner is generally taken during the late autumn and winter months, because it is then that the peak loading is most pronounced and hardest to handle. Other checks, however, are constantly made at all times of the year. It is obvious that this is necessary since the demand is constantly on the increase as a rule, and also that changes are brought about by local conditions along various lines, which affect the loading of other lines as well."

It is interesting to note in this connection that the 1914 Detroit, as well as the 1910 and 1912 Philadelphia, traffic surveys were all made in the autumn of the respective years. The Detroit survey was made by Barclay Parsons & Klapp.⁵ The first Philadelphia survey was made by Ford, Bacon & Davis,⁶ and the second by the Department of City Transit, Philadelphia, with Ford, Bacon & Davis as consulting engineers. To quote from the latter report:⁷

"The survey extended over a period of five weeks from Oct. 14, 1912, to Nov. 18, 1912, which period was selected as representing most nearly normal traffic conditions in Philadelphia."

Quite naturally the periods of heaviest riding throughout the year, the week, and the day have received the greatest amount of attention, but if the traffic survey is to accomplish for any company all the good that it can, it should indicate plainly the relation existing at all times between the amount of transportation furnished and the amount required.

PRELIMINARY WORK

The extent of data to be collected in a street railway traffic study is variable, depending upon how comprehensively it is desired to analyze the transportation problem. Most recent traffic studies consist of a systematic series of inspections and observations in which an actual passenger count is made and the movements of cars and passengers are recorded by inspectors or field agents stationed at selected pertinent points, or riding on cars, or both. In addition other observations of a somewhat general nature are often made. These will be referred to later. Traffic experts are fairly well agreed as to those points on each line of an electric railway system at which a passenger count should be made, and generally a preliminary survey is made to determine them, although occasionally they can be located by a rather casual inspection.

R. M. Feustel, in his report on the 1913 Winnipeg traffic survey, gives an account⁸ of the preliminary work, and other recent studies, such as those in Milwaukee, Cincinnati, Philadelphia, etc., follow similar methods of procedure in laying out the work.

"Inspectors were placed on every car on some lines,

on every other car on other lines, and on every third car on the larger lines. They were kept on the car during the entire day, from the time the car left the carhouse in the morning until late in the evening. Points were chosen along each line, approximately four blocks apart, and the inspector recorded the number of passengers on the car when passing these points and the time of passing. These data gave an accurate record of loading conditions on the different lines, both as to geographical location and as to the time loading occurred. The observations taken covered at least two representative days of travel on each line, and if these two days checked satisfactorily one against the other the data were considered sufficient. If, however, for any special reason the loading was eccentric, additional observations were taken until a normal record was had. An examination of data taken indicates that the travel throughout the day could be divided into rather characteristic periods. The record plotted shows the average of all the observations taken, and each of the characteristic periods was plotted separately into what might be called 'car-loading' curves. These plainly showed the average load carried by the car for each period over the entire length of line. The points where the total number of passengers on the car was noted included all regular transfer points along the line as well as the other important traffic stops. * * *

From the car-loading curves for each line the point of maximum loading was determined. Other points along the line were selected so that in most cases several street observations were taken on each line simultaneously. The inspectors who had become familiar with car loads were then stationed at these points to record cars and passengers."

The following special features were shown by these preliminary observations:

1. Variations of traffic in both directions for the different periods of the day.
2. Territory in which the pick-up of passengers is made.
3. Location of through territory in which comparatively few passengers are discharged or taken on.
4. Location of unloading territory.
5. Duration of time in which the overloading occurs.
6. Effect of certain transfer points on car loading.

The following preliminary observations were made by Ford, Bacon & Davis in their 1910 study on "Philadelphia Service and Equipment":⁹

- "1. Preliminary car riding by inspectors from July 12 to Sept. 1, to determine: (a) Characteristics of traffic. (b) Principal time points.
- "2. Preliminary rush-hour street observations between 4 p. m. and 7 p. m. from July 15 to Aug. 26 to determine: (a) The number of passengers carried past or away from each important point. (b) Regularity of schedule. (c) Car loading."

The practice followed by companies making studies with their own forces is generally less complicated than that indicated by the above references. This has resulted from the fact that the former studies have usually been made for the purpose of answering specific questions as to conditions at definite points, while the latter have sought to obtain information concerning all lines and routes on the same basis. A report made in 1910 shows that out of eighteen companies reporting, eleven used points of maximum load for observations. In addition, certain other points along the line were chosen in order to get roughly the general characteristics of the line.¹⁰

"Similar observations should be made at such other points along the line as may be determined by circumstances. The principal purpose of these latter observations would be to furnish a basis for turning of cars which it is not necessary to operate the entire length of the line."¹¹

An extension of the above method to cover every stop along a line may be found in the so-called "boarding and leaving" tabulation method, reported in use by the Boston Elevated Railway and the Public Service Railway Company of New Jersey¹² and used by Barclay Parsons & Klapp in the 1914 Detroit traffic survey.¹³ It consists of having the checkers ride on a certain proportion of cars along a line and record the number of passengers getting on or off the car at each stop. This method was also used by Ford, Bacon & Davis in their 1910 Philadelphia traffic study.¹⁴ Observers were on one car in every eight along each line for twenty-four hours and recorded the number of passengers getting on or off the car at each stop, together with the time the car passed. The lines were counted by selected groups, related or adjacent lines being counted together. The count extended from Aug. 29 to Sept. 22, but no observations were taken on Saturdays, Sundays or holidays.

Recent traffic studies, particularly those in Milwaukee, Cincinnati, St. Louis and Winnipeg, have demonstrated that the point of maximum load is approximately the same for traffic in each direction—that is, for in-bound cars in the morning and for out-bound cars in the evening; that these points may be considered to follow roughly a line about the congested section; that between the point at which maximum loading first occurs and the point at which it ends the number of passengers is approximately constant, and that there is a point on every line at which the company is justified in terminating part of its service, since few passengers live near the end of the line and the waste of car-miles in order to make a turn is considerable.¹⁵

LENGTH OF PERIOD OF OBSERVATION

The period of time to be covered by the count on any line at any point is fairly well agreed upon, considering the variation in local conditions and the divergent points of view of those having traffic studies in charge. A recent paper¹⁶ comments thus:

"Unless special inspection is made for the rush hours only, the point of maximum loading is covered by an inspector at all times of the day from about 6 a. m. to about midnight. Frequently surveys are made which cover the complete twenty-four hours. This is done only where a question arises about the owl service."

Another says:¹⁶

"The count should cover a long enough period to obtain normal results with twenty-four hours as a minimum."

¹¹Barclay Parsons & Klapp—Report on Detroit Street Railway Traffic and Proposed Subway—January, 1915, pp. 57 and 148. (ELECTRIC RAILWAY JOURNAL, April 3, 1915, p. 664.)

¹²The work was divided into two classes:

"1. The continuous riding of lines from one terminus to another, recording the number of passengers loading and unloading at every street corner, the time from point to point, the number of passengers in the cars at various points, transfer conditions and a few other special items peculiar to individual lines.

"2. Additional trips on all lines through the congested district. * * *

COLLECTION OF TRAFFIC DATA—FORM I—NOTEBOOK RULING FOR FIELD DATA USED BY CHICAGO SURFACE LINES

The reports of many of the recent traffic studies show that twenty-four hours was the minimum time spent at each point. In some cases observations at a point covered a period of several days. A surface car traffic study in the Chicago business district, made in 1909 by the bureau of engineering of the Department of Public Works,¹⁷ covered a twenty-four-hour period. The same amount of time was then spent in a study of the elevated lines. In their 1910 Philadelphia general traffic survey, Ford, Bacon & Davis¹⁸ used a twenty-four-hour period as a minimum upon any one line. In the Winnipeg survey "from two to four days' counts were taken on each line in order to obtain average results."¹⁹

When the points of observation and the period over which data are to be taken have been determined, observers are stationed to collect the required data.

DATA TO BE TAKEN IN FIELD

There is, as has been indicated, considerable divergence in practice between the items recorded in different surveys. This is due to varying local conditions, both as to the character of traffic and as to the purposes of

COLLECTION OF TRAFFIC DATA—FORM II—TALLY SLIP USED BY NEW YORK RAILWAYS

the study, and to the organization of the traffic survey department. It is the usual, although not universal, practice to record all cars in each direction at all observation points along each line, the data for traffic in the two directions being preferably kept separately on the opposite pages of a notebook. It is standard practice on the Chicago Surface Lines to employ a notebook ruled as shown in Form I. The New York Railways uses "tally slips" (Form II) which are conveniently handled and from which figures for fifteen-minute periods are entered on Form III for report to the superintendent of transportation. The Milwaukee Electric Railway & Light Company uses Forms IV, V and VI for collecting and summarizing its traffic data.

In general the forms furnished to observers provide for taking the following information:

1. Name of line.
2. Point of inspection.
3. Origin, destination and direction of car observed.
4. The car number.
5. The run number.
6. The time of arrival and departure.
7. The number of passengers on car.

COLLECTION OF TRAFFIC DATA—FORM IV—TRAFFIC CHECK
USED BY THE MILWAUKEE ELECTRIC RAILWAY
& LIGHT COMPANY

On the last point the practice is not uniform. Some cards require an estimate of the total number of passengers on a car as it passes the observation point. Others specify the number of passengers on the car when arriving and when leaving the observation point. The number getting on and off at each observation point has also been recorded occasionally.

In Cincinnati²⁰ the following information as to passengers was required:

1. Total passengers on car as it arrives and as it leaves.
2. Number of passengers standing in front and rear vestibules.
3. Number of passengers standing in car body.
4. Number of passengers boarding and leaving car.
5. Group or type of passengers: (a) Wealthy or pro-

fessional; (b) middle type and shoppers; (c) laboring people.

In determining the number of passengers on a car, practice has shown that close estimation of the number from the street on the basis of seating capacity (known by the inspector for each type of car) by adding for those standing and subtracting for vacant seats is a sufficiently accurate method—95 per cent accuracy being attained by the inspectors as shown by check during the recent traffic survey in Milwaukee by the Railroad Commission of Wisconsin.²¹

In estimating the number of passengers it is cus-

²¹R. M. Feuster—Report on Winnipeg Street Railway Service—Manitoba Public Utilities Commission, 1913. (ELECTRIC RAILWAY JOURNAL, April 18, 1914, p. 865.) "Checking was continued rigidly. The car number and the time being taken each was a check on every other, as the car could be traced then from one end of line to the other. This work was then again checked against the car counts (preliminary study) taken from same corner, and a very substantial agreement was had."

R. W. Harris—Report on Cincinnati Traffic Conditions, 1912. (ELECTRIC RAILWAY JOURNAL, Nov. 2, 1912, p. 956): "Experience in collecting data of this character has shown this method (estimating from street) to be most accurate. In order to ascertain the correctness of the information thus collected, checkers were put on cars and an accurate count was made of a number of cars being observed by field inspectors. Considering the entire amount of data, the check indicates, on the whole, that the count on the street is 95 per cent accurate."

COLLECTION OF TRAFFIC DATA—FORM VI—SUMMARY OF TRAFFIC CHECK FOR THE MILWAUKEE ELECTRIC RAILWAY
& LIGHT COMPANY

tomy to allow for those voluntarily standing.²² The proportion to which this preferential standing may extend is well brought out by an investigation by the Wisconsin Railroad Commission covering many thousands of observations²³ and showing that with a full carload as high as 20 per cent of the seating capacity represents standing by preference. The extent of preferential standing varies, of course, with local conditions, among which may be noted type of equipment, rules, class of passengers, time of day, and length of ride.²⁴ Probably there is a considerable number of smokers who would rather stand if allowed to smoke, and, when there are vacant seats, it is well to consider these.

The number of passengers on a car has been recorded in the past in several ways—either the actual number estimated or, for instance: light, medium, heavy (Wisconsin Railroad Commission); very light, light, full, crowded, overcrowded (1910 committee on construction of schedules and time-tables of the American Street & Interurban Railway Association); or as no load (less than six), comfortable load (eight or less standing), eight to twenty standing, more than twenty standing (St. Louis Public Service Commission), etc.

In addition to recording all of the above described data, the following additional items are usually considered to be of sufficient value to warrant their collection:

1. Weather conditions throughout day.
2. Abnormal occasions such as ball games, etc.
3. General traffic conditions at observation points, both pedestrian and vehicular.²⁵

Traffic may be classified as vehicular and pedestrian, and again as: few; considerable but causing no delay; considerable and causing much delay.²⁶

The transportation department of the old Metropolitan Street Railway, New York, classified delays to cars of five minutes or more as follows:²⁷

1. Blocking by vehicles.
2. Carelessness of employees.
3. Miscellaneous car trouble.
4. Accidents.
5. Plow trouble.
6. Electrical car trouble other than plow trouble.
7. Electrical transmission trouble.
8. Mechanical defects (cars).
9. Faulty track.

²²Bion J. Arnold—Report on Traffic Situation in San Francisco, 1913 (ELECTRIC RAILWAY JOURNAL, Jan. 11, 1913, p. 63): "Allowance must be made, especially in San Francisco, for the existing fact that many passengers stand by preference even when seats are vacant."

²³Railroad Commission of Wisconsin, 13—W. R. C. R.—156.

²⁴R. W. Harris—Report on Cincinnati Traffic Conditions, 1912 (ELECTRIC RAILWAY JOURNAL, Nov. 2, 1912, p. 956): "The number of preferential standing passengers for any car load is peculiar to the conditions existing in each locality. In Madison, Wis., 21 per cent of any load will stand by preference; in La Crosse, 15.5 per cent; in Lincoln, Neb., 14 per cent; in Milwaukee, 19 per cent, and in Cincinnati, 15.5 per cent."

²⁵R. B. Stearns, vice-president and general manager The Milwaukee Electric Railway & Light Company, made the following statement in the summer of 1914: "Since smoking on the cars in the Milwaukee system has been discontinued and pay-within systems of folding doors and closed platforms adopted, a recent recalculation of the number of passengers standing by preference would indicate approximately 5 per cent as compared with 19 per cent a few years ago when smoking was permitted and all the cars were operated with open platforms, front and rear."

²⁶Bion J. Arnold—San Francisco Transportation Report on Traffic and Service—December, 1912 (ELECTRIC RAILWAY JOURNAL, Jan. 11, 1913, p. 64): "One very serious cause of the increased difficulties of giving adequate service is the interference of vehicle traffic. A very material improvement, however, has resulted from the institution of traffic regulations in this city (San Francisco) by the traffic squad of the police department, with results that heavy and slow moving vehicles are being gradually encouraged to seek and follow less congested thoroughfares, which has greatly facilitated passenger movement."

10. Fires.

11. Caused by outside lines.

12. Miscellaneous trouble.

13. Due to outside construction.

14. Due to obstruction in slot.

In order that any traffic study may furnish information of the greatest value to the officers of a transportation company, it must determine as far as practicable the causes of the variations in traffic demand. To do this it is necessary to note many items which may at first seem superfluous. It should be borne in mind that while the primary purpose of traffic studies is to permit the making of scientific schedules, there is frequent opportunity to use the information derived from such studies in prognosticating the future, in meeting complaints, and in stimulating traffic at times and places such as will make the increased traffic profitable.

The steps which must be taken in any community to determine the characteristics of the various lines will necessarily vary, but the following suggestions cover the field in a general way and have formed the basis of inspector's reports in various surveys:

1. Divide line into characteristic sections, and discuss each under the heads: (a) Class of passengers; (b) time of travel; (c) probable destination.

2. Locate various origins of passengers along line and obtain destination and probable route (factories, etc.).

3. State transfer points and give idea as to number (in percentage) of passengers leaving car from which transfer is made, transferring to other lines. If cars on more than one route operate over line, make separate estimates of interchange of traffic.

4. Determine attitude of public as regards service given by the particular line (casual conversation).

5. Make a few specific observations (record counts) of movements of passengers (seated to vestibule and vice versa) in the car as it approaches a stop in downtown and outlying districts.

6. How does standing by preference vary with time of day, class of passengers, district, etc.?

The method used in the 1912 Philadelphia traffic survey differed in many respects from all of the preceding and might be of comparative interest, though its ultimate purpose was somewhat different from most of the herein mentioned studies. To quote from the report:²⁸

"The present flow of traffic between all sections of the city was determined by a traffic survey made by the following novel and practical method."

A brief summary follows:

1. A program was prepared from schedules in effect on the Philadelphia Rapid Transit Company lines providing for: (a) The counting of passengers on about one car in every five (eighteen-hour) cars operated; (b) about four lines a day were to be covered.

2. Two experienced conductors (borrowed from the company and properly instructed and aided) were placed on each car: (a) The first, stationed at the entrance, properly filled out and presented an identification slip to each passenger with a request to keep same until collected; (b) the second, stationed at the exit, collected such slips and noted on them, after inquiry, the passengers' destination.

3. The count slips were printed tickets, somewhat larger than street car transfers, were numbered serially and supplied in pads of 100. Differently colored slips were used for each of four general directions of travel.

4. At end of each half trip all slips collected for it

²⁸A. M. Taylor—"The Solution of a City's Transit Problem"—Electric Journal, October, 1914, p. 516. (ELECTRIC RAILWAY JOURNAL, Jan. 10, 1914, pp. 76-79.)

were inclosed in an envelope giving the following information. (a) Number of envelope corresponding to the number of half trips counted; (b) name of collector; (c) date; (d) name and number of line being counted; (e) direction; (f) time of beginning of half trip; (g) number of slips inclosed; (h) delays; (i) unusual traffic movements, and (j) other notes.

5. The envelopes containing slips were turned in after midnight each day, and were then sent to the Statistical Service Company. Here the information contained on slips was transferred to twenty-four column Hollerith cards, which were then electrically sorted and recorded.

6. No count was made on holidays, Saturdays or Sundays.

7. Checks were made by repeating the count on several lines. These recounts were found to agree in a satisfactory manner with the originals.

8. The data recorded by the Statistical Service Company were returned to the survey office, where they were further analyzed and charted.

RECORDING DATA

"Results are plotted into curves from which it can be readily seen wherein service is defective and recommendations for changes made accordingly."

This comment on the practice of the Board of Supervising Engineers, Chicago Surface Lines, may well serve both as a statement of present general practice and as a recommendation to all engaged in the accumulation of traffic data. Such curves simply represent a summary of observations, but for the great majority of those dealing with such matters the graphic representation of data is far more quickly interpreted than numerical tabulations.

A few typical curves together with the data from which they are drawn will be illustrated. An observer on a car noted passengers boarding and alighting during a run of sixteen blocks, as shown by Table I. Fig. 1 shows this information graphically.²⁹ Data for, say, fifteen or thirty-minute periods can be combined readily and drawn in the same manner, or from street observations as to number of passengers on the car the car loading line can be drawn.

The variation in traffic throughout the day at any point may be shown by a diagram similar to Fig. 2. Here an inspector stationed at one point throughout the day reports the data shown in Table II. Such a

²⁹When the stops are laid off on the base line to the scale of their distances apart in miles, the area under this curve represents passenger miles, and divided by the total passengers "on" gives the average length of ride. The maximum ordinate will generally be less than the total "ons." The area between a horizontal line representing seating capacity and that part of the curve lying above the seating capacity line represents "standing passenger miles."

diagram as Fig. 2 serves to indicate whether or not unusual loading is due to distortion of headway, and also, by the use of a line showing seating capacity, points out the relation between excess seats and standing passengers for the particular point on the line.

Of general application and frequent use, the diagram reproduced in Fig. 3 combines several important features. An observer records for each car the number of passengers aboard and the time of passing the point of observation. The seating capacity of cars being known, summaries are made (see Form VI, summary sheet of the Milwaukee Electric Railway & Light Company), and the results plotted as indicated. By plotting on the same figure the seats required by company

COLLECTION OF TRAFFIC DATA—FIG. 3—GRAPHICAL PRESENTATION OF DATA SHOWING PASSENGERS ABOARD, TIME, SEATING CAPACITY AND STANDARD SEATING REQUIREMENTS

standards, or by franchise standards or those of commissions, the sufficiency of the service can be quickly judged.

Other diagrams than those here illustrated will readily suggest themselves and will permit the setting forth of the tabular data in ways best fitted to the problem under examination.

SUMMARY

It is impossible to indicate other than very general conclusions with regard to the frequency of the collection of data. It may be concluded, however, that this is to an extent automatically determined by conditions already enumerated but that in order to secure full advantage of fluctuations in traffic and to anticipate public complaints, the interval between such studies should be short. Moreover, such studies should be made not only for week days but also for Saturdays and Sundays, and not only for rush periods but for non-rush periods as well. Furthermore, in order to estimate peak conditions accurately, some traffic studies should always be made in the late autumn and winter months.

The type of property will have an important bearing on this question. Following the classification proposed in a previous article in this series, published in the *ELECTRIC RAILWAY JOURNAL* of June 19, the varying requirements of different companies may be roughly stated as follows:

For the larger companies, all lines should be subjected to a twenty-four-hour study covering week days, Saturdays, Sundays and holidays, and representing also traffic conditions throughout the various seasons of the year. The size of the department which it is necessary to maintain to make these studies will depend upon the frequency with which it is desired to complete the study of all lines in the system and upon the number of lines it is possible for the department to consider at a time.

For the companies of medium size, a twenty-four-hour general study should be made periodically and eighteen-hour studies on the heaviest lines in rotation.

For the small companies, an eighteen-hour general study, supplemented with special data concerning the points of maximum loading on certain lines during rush hours, will be sufficient.

No definite conclusion can be drawn as to the extent of data to be taken in any traffic study except that the more comprehensive the study made, the greater the value of the information secured. Stated very generally, however, experience indicates the following general procedure:

A preliminary study, covering a number of representative car trips during the different periods of the day and ascertaining the number of passengers at different points along the route, should be made for each line to determine the points of future observation. The points of maximum load and a number of others bringing out the characteristics of the traffic on the line should be used as these points of observation, together with points at which there are cross-overs which may be used for short routing. A car-loading curve, based on the preliminary observations, will help to locate the desired points. The period of time covered by the observations on any one line at any one point should be long enough to give normal results, with twenty-four hours as the minimum.

Inspectors should be stationed at each observation point and should record accurately the following data for every car moving in either direction.

1. Name of line.
2. Point of inspection.
3. Day and date.

4. Weather.

5. Origin, destination and direction of car.

6. Car number.

7. Run number.

8. Time.

9. Number of passengers on car.

The last-named item should be estimated on the basis of seating capacity, by adding for those standing and subtracting for vacant seats (seating capacity of all types being known by inspectors). Allowance should be made for those voluntarily standing, varying from 5 per cent to 20 per cent, according to conditions. In addition to the above data, any other pertinent remarks should be made, such as: ball game, street traffic light, medium, heavy, etc.

A general survey of each line indicating the following should be made:

1. Class of passengers: (a) Business and professional; (b) middle type and shoppers; (c) laboring people.

2. Time of travel.

3. Probable origin and destination (factories, etc.).

4. Transfer points and their effect.

5. Attitude of public as regards service on the particular line.

6. Other pertinent data.

It is possible to reach more definite conclusions concerning the extent of data to be taken and the manner of its determination, by grouping companies in classes as has been previously done in discussing the organization and the frequency of studies. Adopting this plan, the following paragraphs take up the question of method in greater detail.

It is neither necessary nor practicable to study the loading of every car at every point of a trip. It is desirable, however, and the larger companies will obtain this information, to know the average number of passengers getting on and off each car at every point for twenty-four hours of the day and for various days and periods of the year. This information should be obtained by a sampling process—that is, by taking certain cars and certain points at one time and other cars and other points at other times. It will be found that the traffic characteristics of the various car trips will be very nearly alike from day to day, so that it will be possible to combine data concerning one car line taken to-day with that taken concerning another car line to-morrow, provided, of course, no unusual circumstances arise.

For companies of medium size, the number of passengers getting on and off each car at important traffic points previously determined should be noted, and for the smaller companies an estimate should be made of the number of passengers on each car at the point of maximum loading during rush hours.

At the beginning of any traffic study, all the lines should be listed and the general characteristics of the territory they serve should be recorded. The relation of these lines to each other will determine to a certain extent the order in which they will be studied. The general characteristics of the traffic on each line can be determined from conductors' trip reports and from a few rides of inspection prior to the beginning of the collection of specific data.

Each observer should be carefully instructed as to the observations which he is to make and he should be furnished with convenient forms ruled and with printed headings. It is very necessary that every effort should be made to place the observations on a comparable basis, inasmuch as the data from many observers are combined to make the final determination of the sufficiency of service on any line.

In addition to the data concerning the number of passengers on cars at various points, together with the identification of the car by route and time, the observer should record information concerning street traffic, unusual occasions, weather, etc., in order that the extreme variations may be eliminated from the statistical analysis. It is generally advisable also to determine the diversity of loading. For this purpose the passengers in each car passing a given point, for say fifteen-minute periods throughout the day, should be determined and the relation of the maximum to the average should be computed. Certain typical forms for use in collecting and recording this information have been shown.

After these data have been assembled they can be made of greatest value by being represented graphically. There are three general types of curves which it is found helpful to prepare from the traffic data collected. The first is a curve on the horizontal axis of which is laid off the various streets passed in a car trip. Parallel to the vertical axis and above the horizontal axis there is laid off a line proportional in length to the number of passengers boarding the car at each street, and below the horizontal axis, a similar line representing the number of passengers leaving the car at each street. By computing the cumulative difference of passengers on and off, the curve showing the number of people on the car at each street can be drawn.

The second typical curve shows the number of passengers on each car passing a given point and the time at which the car passed the point. The vertical lines representing the number of passengers on the car are drawn at horizontal distances representing the time, and a line connecting the upper extremities of the vertical line represents the loading at any point throughout the period of study. The distance between the lines indicates, of course, the headway of cars and whether or not unusual loadings were due to irregular spacing of cars.

The third general type of curve is one which is plotted for any given point on a line showing, for each fifteen or thirty-minute period during the time under observation, the number of passengers carried by the point, the number of seats furnished and the number of seats which should be furnished in order to conform to the company's rules or to regulations laid down by some controlling body.

Another article will take up the analysis of these curves and their application to the problem of constructing time-tables—which is, of course, the immediate purpose of the traffic survey. There are other ways, however, in which the traffic survey department can be of value to those in charge of the property, and all data should be further analyzed for suggestions as to means of stimulating traffic on such lines and at such times as will make it a profitable addition to the business. There are many questions which the traffic survey department is in a position to investigate and shed light upon, and it should be an able ally of the traffic department.

The United Gas & Electric Company, the Louisville & Southern Indiana Traction Company, and the Louisville & Northern Railway & Light Company, New Albany, Ind., are behind a plan which will provide a monster auditorium in Glenwood Park, the outing park in Indiana, between New Albany and Jeffersonville and across from Louisville. This is a popular picnic ground, a chautauqua ground, camp meeting ground, etc. Incidentally it is signed up for picnics of one kind or another and other attractions for practically all of the summer, and the three railway lines mentioned will get the business.

New Haven Operating Results

In Several Written Discussions on W. S. Murray's Paper on Main Line Electrifications the Relative Costs of Power for Steam and for Electric Operation Were Taken Up

In a paper presented before the Franklin Institute and reported in abstract in the *ELECTRIC RAILWAY JOURNAL* for Jan. 30, W. S. Murray, consulting engineer New York, New Haven & Hartford Railroad, gave figures covering the cost of construction and operation for the electrified division of the New Haven Railroad and discussed the general principles of successful steam-railroad electrification. Several written discussions of the points brought out by Mr. Murray were presented at the meeting, and these have become available for publication through the *Journal of the Franklin Institute*, being given in abstract below.

Alfred W. Gibbs, chief mechanical engineer, Pennsylvania Railroad Company, contended that 1 lb. of coal burned under the boiler of a central power plant would not develop twice the drawbar power that the same amount of coal would produce when burned in a locomotive firebox. He cited the record of twenty-seven tests on one locomotive in the testing plant at Altoona. The tests showed that the coal consumption per drawbar horsepower ranged from 2.5 lb. to 5 lb., twelve of the tests showing rates between 2.5 lb. and 3 lb. These are the rates when the locomotive is running, and added to them are certain stand-by losses at terminals. The power station expense, as given by Mr. Murray at 0.69 cent per kilowatt-hour, including fixed charges, taxes and insurance of 0.18 cent, evidently did not include a charge for obsolescence. The fixed overhead charge should be nearly double the figure given, or say, 0.35 cent or 0.4 cent per kilowatt-hour.

George R. Henderson considered that uniformity of traffic is just as important as density of traffic because the peak loads can only be smoothed out when the traffic is uniform, the importance of this being measured by the fact that the power-house and transmission lines cost in the order of \$100 per kilowatt. Mr. Henderson considered that the relative fuel consumption for steam and electric locomotives of 50 per cent mentioned by Mr. Murray was due to the comparison with the old type of saturated-steam locomotives. Modern steam engines fitted with super-heaters would change this ratio to, say, 65 per cent.

E. H. McHenry, McHenry & Murray, New Haven, spoke of the growing tendency toward the consolidation of the best features of all of the divergent systems into one system of greatest combined merit. The so-called war of the systems was already nearly at an end.

C. Renshaw, Westinghouse Electric & Manufacturing Company, considered that, owing to ten years' experience in construction and operation, the New Haven electrical plant could be reproduced to-day for not more than 60 per cent of its original cost.

F. E. Wynne, Westinghouse Electric & Manufacturing Company, called attention to the figure of \$15,000,000 given as the expenditure for electrifying the New Haven Railroad to date, this indicating that the expenditure has been \$120,000 per unit of motor power and \$30,000 per mile of single track. Complete electrification of the New York-New Haven division will be accomplished without additional expenditure for trolley construction, and consequently these unit figures eventually will be somewhat changed. The estimated reproduction cost of the installation at 60 per cent of the original cost indicates that the total construction may be made for less than \$70,000 per unit of motor power, while the cost per mile of single track will be about \$20,000. With

regard to the results secured in connection with energy consumption, these check closely the accuracy of calculations made in connection with the service, thus illustrating the fact that energy consumption with electric operation can be very closely predetermined where trains are operated on a steam railroad basis with definite schedules and definite stops.

Philip Torchio, New York Edison Company, then spoke of the fact that power companies, by averaging the power demand from a great diversity of users, reaped economic advantages in the production of power which the railroad cannot secure under independent generation. The saving in investment in power stations, substations and transmission lines may represent a sensible item in the costs of railroad electrification.

W. A. Del Mar, New York, considered that the results submitted in the paper would have been more valuable if they had been based upon a complete year rather than upon a record for two months only. He asked whether the \$15,000,000 expenditures for the installation as mentioned by Mr. Murray included the cost of reducing telephone disturbances and of altering the right-of-way to conform with electrical requirements. Mr. Del Mar was appalled at the development charges amounting to 40 per cent of the entire investment, which were to be inferred from the statement that the present system could be replaced for 60 per cent of the original cost. An interesting feature about the installation had been the development from the complex to the simple and mechanical details, and vice versa in the electrical features. He asked whether the mileages upon which the unit costs were based included yard switching and light locomotive mileage, as these two items might easily amount to 15 per cent of the total. He spoke favorably of results obtained by watt-meters on locomotives.

R. H. Wheeler, Mackenzie, Mann & Company, Ltd., Montreal, stated that a form of electric power which may be standardized for all classes of train service was vitally necessary. He considered that the d.c. motor was especially desirable, but it could be used only in connection with the mercury arc rectifier in case the overhead line was energized with alternating current. This imposed a serious handicap in both weight and control complication. However, by placing the rectifier in the roadside substation and supplying the overhead wire with power at 3000 volts direct current, the desired essentials of transmission economy and standardization of motor-power equipment were obtained. This second standard was offered to emphasize Mr. Murray's definition of the successes arising from a choice of energy which can be standardized.

CLOSURE BY MR. MURRAY

In closing Mr. Murray stated that the fixed charges mentioned in his paper as 1.8 mills per kilowatt-hour were in error and should be changed to 2.9 mills, the latter figure being based upon an 11 per cent rate on the total investment involved, carrying with it interest, insurance, depreciation and taxes. The total cost, therefore, for energy would become 0.8 cent per kilowatt-hour instead of 0.69 cent, the rate mentioned in the paper.

Realization of the suggestions regarding the uniformity of traffic is, he said, largely accomplished by the electrical movement of freight as well as passenger trains, as the maximum power demand for the former can be made to follow at the time of minimum demand for the latter. By plotting the combined load curve of the New Haven Railroad's passenger, freight and switching services without any rearrangement of the schedules as they are made up to-day, a load factor of 75 per cent is secured. With regard to fuel saving, if

the economy of generating units remained fixed it would be fair to grant Mr. Henderson's point that the ratio of coal consumption should be changed from 50 per cent to 65 per cent. On the other hand, the improvement in over-all efficiency of the generating plant is easily keeping pace with that of steam locomotive, and, granting this, there are no other constants or variables which will tend to alter the ratio of 1 to 2 in favor of the fuel economy of electricity versus steam.

With regard to the transfer of steam locomotive power to different divisions of a road where congestion may require it, it was easily conceivable that a division could be electrified with economy without including the financial credit due to the steam locomotive replaced, thus automatically providing steam locomotives for the congested districts and leaving the electrical apparatus to be operated at very high load factor.

The increased reliability of operation with electricity which had been referred to was based upon the engine mileage per failure. A fair average for steam locomotive operation might be cited as 5000 miles per engine failure whereas electrical operation certainly should be as high as 12,000 miles, and in a number of instances on the New Haven it has been as high as 18,000 miles per engine failure. Of course, maintenance and repairs on electric locomotives should be compared to those of steam upon the basis of equal service and weight on drivers.

With regard to the coal consumption cited by Mr. Gibbs as applying to steam locomotives, Mr. Murray emphasized the necessity for considering the stand-by losses in a comparison between steam and electric power, these stand-by losses not being included in Mr. Gibbs' figures for steam locomotive coal consumption.

In answer to Mr. Del Mar's questions, Mr. Murray said that the expenditures made to reduce telephone interference and for altering the right-of-way to conform with electrical requirements were included in the general figure of \$15,000,000 for the cost of the entire installation. However, experience has indicated a method of laying out the transmission and distribution systems whereby automatic compensation for telegraph and telephone services can be secured for a very nominal amount. The so-called high development charges appearing in the New Haven installation were in reality due to reductions of cost of material in many cases. In 1907 large high-tension insulators cost \$63 each while to-day with three times greater factor of safety the price has been reduced to \$7.

With regard to the mileages upon which were based the unit costs given in his paper, Mr. Murray stated that these included both passenger and freight service but did not include yard switching, which is provided for by engines designed especially for that purpose. Light mileage of locomotives was included for the mileages of road engines. The train mileages did not include the mileage of light locomotives, but these had been recorded and were included in the total locomotive mileage, including the total unit cost per locomotive-mile both in freight and passenger service.

The point made by Mr. Del Mar with regard to the negligible error of meter registration on locomotives was interesting, and so far as Mr. Murray had been able to determine the meters on the New Haven locomotives have been accurate and valuable adjuncts in the determination of the general distribution of power.

Employees of the Illinois Traction Company at Champaign, Ill., have perfected a permanent organization for an I. T. S. band, and weekly rehearsals are being held. The company gives the use of a room on the third floor of its new office building at Champaign for this purpose.

Safety-First Committee Meets

Prominent Railway Officials Discuss Precautionary Measures at First Meeting of the Transportation Committee of the Safety First Federation of America

Policies and activities for the ensuing year regarding uniform street traffic regulation were discussed at the first meeting of the transportation committee of the Safety First Federation of America on July 13, at the Federation's headquarters, 6 East Thirty-ninth Street, New York. The meeting was presided over by C. Loomis Allen, president of the American Electric Railway Association and chairman of the transportation committee.

The field of work which has been assigned to the transportation committee covers a wide scope in regard to both steam and electric railway operation, as indicated by the following subjects, which were selected at the organization meeting at Detroit for consideration by the committee:

1. Near-side stop for street cars.
2. Type of cars in regard to entrances and exits.
3. Uniform street regulation governing the operation of jitney buses.
4. Uniform signs and signals at grade crossings (steam and electric lines).
5. Educational campaign outlining the dangers of grade crossings and trespassing on railway property.
6. Suggestions offered by the street traffic committee at the meeting held in Detroit on June 4.

The meeting in New York was attended by several prominent railway executives and operating officials, many of whom have been designated to serve upon the committee by organizations affiliated with the Safety First Federation. In addition thereto, representatives of other organizations concerned in various forms of transportation were in attendance. The following executive officers of the Federation were present either at the business sessions or the luncheon which was later tendered to the committee by President Kingsley: D. P. Kingsley, president of the Federation and of the New York Life Insurance Company; John Gillespie, third vice-president and police commissioner of Detroit; C. L. Bernheimer, treasurer of the Federation and president Safety First Society of New York, and F. H. Elliott, general secretary. The members of the transportation committee present included the following: Chairman, C. Loomis Allen, president American Electric Railway Association, Syracuse, N. Y.; W. E. Cann, assistant to general manager Detroit United Railway, representing the Safety First Society of Greater Detroit; R. W. Meade, president Fifth Avenue Coach Company, representing the Safety First Society of New York City; J. K. Punderford, vice-president and general manager The Connecticut Company, New Haven, Conn., representing the New Haven Chamber of Commerce; J. T. Moffet, superintendent of transportation Washington Railway & Electric Company, Washington, D. C., representing the Washington Safety First Association; F. L. Hubbard, assistant to the general manager Toronto Railways, representing the Ontario Safety League; F. W. Bacon, vice-president Kentucky Traction & Terminal Company, Lexington, Ky.; J. W. Crawford, supervisor of claims Philadelphia Rapid Transit Company, representing the Philadelphia street traffic committee, and H. B. Potter, assistant to the second vice-president Boston Elevated Railway, representing M. C. Brush, who was not able to be present. The members of the committee not in attendance were H. Spoehrer and Richard McCulloch of St. Louis, George Keegan of New York,

T. C. Powell of Cincinnati, C. R. Myers of Indianapolis, and E. G. Connette of Buffalo. Among the others present were E. B. Burritt, secretary American Electric Railway Association, and G. A. Walters, secretary to the police commissioner, Detroit.

BUSINESS MEETING

F. H. Elliott, general secretary of the Federation, opened the meeting by presenting a general outline of the present development of the Safety First Federation and the work which it proposes to do in future. The Federation, Mr. Elliott stated, was organized last February. Its membership includes at present all of the safety-first organizations except two in the country, representatives of public service commissions, chambers of commerce in various cities and states, organizations concerned with transportation and various public-spirited citizens. No effort has yet been made to develop a large membership list. The purpose of the new organization is to direct work entirely to problems of public rather than of industrial safety. One of the direct results of the February meeting was the preparation of a safety-first text-book for children. This book, a few preliminary copies of which are now printed, contains rhymes and jingles accompanied by four-color illustrations calculated to impress children with the idea of caution in avoiding the dangers of street cars, automobiles, fire and water. Mr. Elliott spoke of the suggestions which were recommended for general use at the meeting of the street traffic committee in Detroit on June 4-5. These suggestions were mentioned on page 1137 of the ELECTRIC RAILWAY JOURNAL for June 12.

The business of the present meeting, Mr. Elliott stated, was to consider in a preliminary way all transportation matters regarding safety in preparation for the first annual convention of the Safety First Federation of America, to be held at Detroit on Oct. 19, 20 and 21. In commenting on the near-side stop Mr. Elliott alluded to its success in New York as shown by the report of the Public Service Commission for the first six months of its operation. At present there is but one New York newspaper which is agitating against it. Apparently the only difficulty met is that of having to board and alight in winter from the rear ends of cars in an un-snow-swept part of the street. This objection raised the question of whether the position of entrances on cars could be standardized.

C. Loomis Allen stated that standardization of car equipment had received careful consideration by the American Electric Railway Association and standards of certain kinds had already been adopted. While he doubted whether it would be possible to adopt standard cars he maintained that the committee could do many things that make for real safety. It could demonstrate the advantages of the near-side stop by citing its successful use in other cities. It may take time to convince railways and public service commissions of the advantages obtained thereby.

W. E. Cann, assistant to the general manager Detroit (Mich.) United Railway, said that after fifteen months of experience with the near-side stop, he wished to go on record as favoring it. This system has met with almost universal favor in Detroit. The only contention against it was that of having to alight in dirt or

snow. For that matter, however, crosswalks were apt to be as dirty as the rest of the street. Moreover, the increasing use of trailers had removed any advantages which the far-side stop may have had, because with trailers all entrances could not be opposite the crosswalk. Mr. Cann spoke favorably of the use of trailers in Detroit. He considered the jitney movement not a business proposition but the result of the hard times. Nevertheless, its regulation is undoubtedly needed. He believed in the great necessity of an educational campaign on the dangers of grade crossings. During the week-end of Independence Day six people were killed at grade crossings in Detroit. In one of these cases he knew there was absolutely no excuse. No attention whatsoever was paid to the whistle of the train by the driver of the automobile. An educational safety campaign could be largely handled by the local newspapers. Mr. Cann stated that the signals of traffic policemen absolutely govern the cars in Detroit. Fire siren whistles also are held as sacred as a red flag on the railway. He hoped that the use of siren whistles on automobiles could be confined to fire-department vehicles, so that the public would be put on its guard whenever the whistle was heard. He thought that there ought to be signs showing the proximity of fire department stations.

J. W. Crawford, supervisor of claims Philadelphia Rapid Transit Company, described the safety zones used in that city. They are defined by rope barriers, held in uprights.

J. K. Punderford, vice-president and general manager The Connecticut Company, New Haven, Conn., explained that it would be unnecessary, so far as his own railway was concerned, to put through laws enforcing some of the present suggestions for large cities because his property reached only small cities. However, he was decidedly in favor of requiring all teams to show lights at night. A law regulating the encroachment of vehicles on tracks should also be desirable. A written examination for motormen had recently been adopted by his company and he believed it was in the interests of safety. The questions relate to safety in operation. Near-side stops are being made at certain street intersections. The laborers of the company are used to clean off the streets in winter where the near-side stop is used, otherwise the cleaning off probably would not be done. Mr. Punderford thinks that the possibility of standardized car equipment as regards entrances is hardly more than Utopian. A good innovation recently ordered by the Public Service Commission for all electric railways in Connecticut has been the installment of uniform signs where street car tracks emerge from a private to a public highway. These signs are erected diagonally and bear the words "Railway Crossing." He also described an arrangement made by the company with the fire department in New Haven by which the department apparatus, in going to fires, would use certain designated streets. At the intersections of these streets with the railway lines signs are posted and a full stop of the cars is required.

F. W. Bacon, vice-president Kentucky Traction & Terminal Company, Lexington, Ky., described the educational campaign which his railway had conducted in issuing to school children small buttons bearing the words "I stop before I cross the track" and signs for teamsters and merchants to put on their vehicles, "We stop before we cross the track." Mr. Bacon suggested as an additional traffic recommendation the question of regulating slow-moving vehicles on street car tracks. If horse-drawn vehicles could be eliminated from the tracks the movement of traffic could be greatly facilitated and small interruptions prevented. Country people were special offenders in this respect. They

were apt to stop their buggies for conversation while on the track. In regard to safety signs his railway has made a special effort to drive home the idea of safety by placarding the whole line with special warning signs at every road and lane intersection and in the near vicinity of livery stables and garages.

H. B. Potter, assistant to the second vice-president Boston (Mass.) Elevated Railway, spoke of the difficulty of adopting standardized traffic rules for irregular streets, as in Boston, which are said to have been laid out from the original cow paths. His company has installed many near-side stops. Each locality, however, has to be considered separately. It would be inexpedient, for example, to install two near-side stops where two streets cross the tracks at close intervals. This innovation should be installed slowly, otherwise the American public, conscious of its inalienable rights, will start an agitation to revert to the old practice. Mr. Potter believed that it would be a good thing if the Federation could bring about standard rules for steam and electric road grade crossings. Better co-operation between the steam and electric roads was needed. Steam railroad men are apt to adopt the big brother attitude toward their electric railway contemporaries.

Mr. Potter thought that safety-first campaigns were very difficult to launch by the railways alone, because the public was apt to suspect ulterior motives. In the recent campaign in Boston the co-operation of the newspapers was obtained. The press announced generous prizes to children who could compose the best poems on "Safety First." This movement was taken up with enthusiasm by many schools. In many cases the teachers had pupils learn the poems. The railway, however, wanted to conduct a wider campaign. Advertisements on safety first were posted conspicuously on inside cars and on billboards. This movement was successful largely because it was supported by the Chamber of Commerce.

Richard W. Meade, president Fifth Avenue Coach Company, New York, said that the jitney bus was a forerunner of a transportation system that was certain to increase in this country in proportion to the improvement in roads and motor vehicle construction. The bus system in London is an example of wonderfully efficient operation. The shops there are a model of mechanical perfection. If bus operation is possible in England it is also possible in the United States. The Federation can be of much assistance in drafting regulations for safety which shall be fair and just to all interests.

At the suggestion of Mr. Allen, two sub-committees were appointed for the purpose of preparing reports for the transportation committee in anticipation of the safety convention in the fall. These sub-committees included a committee on municipal regulation, composed of W. E. Cann, J. T. Moffet, J. W. Crawford and H. B. Potter, and a committee on State and federal regulation composed of J. K. Punderford, R. W. Meade, F. W. Bacon and E. G. Connette.

A luncheon at the Republican Club followed the morning meeting and in the afternoon sessions of the two sub-committees were held. At the luncheon Darwin P. Kingsley, president New York Life Insurance Company and of the Safety First Federation, spoke of the aims of the safety organization. The safety-first movement, Mr. Kingsley said, was the natural outgrowth of the intensive life of to-day. He referred to the large number of fatalities in New York and said that one of the highest aims of the safety-first organization should be to educate the public in the hope of diminishing these accidents. The public was largely to blame for a great many of them and yet was always ready to condemn public utility corporations without awaiting investiga-

tions. The safety-first movement is not purely humanitarian, however, but is a good, sound business proposition. The need of regulating traffic, for instance, was graphically illustrated at the time of the recent police parade in New York City. Soon after the traffic police were withdrawn to parade a condition reigned which approached chaos. The more intensive the life we lead the more necessary is extended government control.

Railway Motor Commutation and Flashing

R. E. Hellmund Discusses the Problems of the Design of Direct-Current Motors from the Standpoint of Commutation

In the current issue of the *Electric Journal* R. E. Hellmund of the Westinghouse Electric & Manufacturing Company has an elaborate article on the causes of flashing and sparking in electric railway motors. Some of the important points are abstracted below.

Improved commutation of itself is of little advantage to a railway company except as it brings with it reduced maintenance cost. Commutator wear is reduced as is evidenced from the fact that the sale of replacement commutators by manufacturers has practically ceased since the introduction of commutating-pole motors. Improved commutation further means reduced wear of carbons and reduced quantities of carbon and carbon dust inside the motor. Such dust accumulations often cause insulation breakdowns. Good commutation further avoids roughening of the commutator which is usually followed by vibration, leading to wear and tear in the brush-holder parts. It also prevents commutator blackening, which leads to the breaking down of the insulation between segments.

The commutating pole has made possible the carrying of heavy overloads on railway motors, permitting higher rates of acceleration and therefore more economical operation, and in some cases making it possible to use two-motor in place of four-motor equipments. It has also made field control possible as well as the design of direct-connected motors for voltages higher than 600, and for use with very small wheels with armature diameters correspondingly small.

Commutating conditions cannot be made altogether ideal for several reasons. Ideal commutation requires a commutating-pole flux changing in proportion to the load, which in turn requires unsaturated magnetic poles. On account of space limitations the iron parts of motors cannot be made as heavy as would be required for this purpose. Further, it is not advisable to design armatures with a large number of small and flimsy teeth and a large number of weak coils, giving numerous chances for insulation breakdown. The preference is for large slots which lead to certain irregularities in commutation. Again, it is not possible to secure the best ratios between armature diameter and length from the commutation standpoint.

Flashing in railway motors is the formation of electric arcs just as in an arc lamp. In the latter the carbons are brought into contact and subsequently drawn apart. After the arc has been established a comparatively small voltage will maintain it. In order to obtain flashing in a railway motor, it is necessary, first, that an arc be established and, second, that this be maintained long enough to cause a flash around the commutator, either extending part of the distance from brush to brush or the entire distance, or a distance around part of the commutator and from thence to ground. Flashing can be prevented by avoiding the formation of the arc and by keeping the voltage between commutator segments so small that an arc cannot be maintained between them. Improving commutation reduces

flashing, but even with commutating poles arcs will occur. Brushes may be thrown away from the commutator as a result of a jar, and one of the most successful means for preventing flashing from this cause is the use of a comparatively high pressure on the carbons. In motors having good commutation satisfactory results can be obtained with brush pressures of from 3 to 5 lb. per square inch, although a somewhat increased pressure does not materially increase the losses and wear. This pressure is not always a sufficient safeguard against jumping of brushes. It seems, therefore, in many cases advisable to use pressures in excess of 5 lb. per square inch, a good rule being to apply an initial brush pressure of 5 lb. per square inch, decreasing it slightly if there is no trouble from flashing and increasing it from 6 lb. to 7 lb. per square inch if flashing proves troublesome. It has even been found necessary to raise the pressure as high as 9 lb. per square inch in some cases, but in these the increase in brush and commutator wear was quite noticeable. Jumping of the carbons is the most frequent cause of sparking in commutating-pole motors.

Sparking occurs also in commutating-pole motors under abnormal running conditions, due to the fact that with sudden changes in current the commutating flux does not immediately respond to these changes. Any interruption and re-establishment of power will, in a series motor, always cause temporary arcing and spitting at the brushes.

The above statements explain why the commutating poles have not eliminated the first cause of flashing altogether. Even with the commutating pole it is necessary to design motors so that there is not much voltage between commutator segments. There is, however, a limit to the reduction in the number of commutator bars and the corresponding reduction in the number of turns between bars due to the limit of practicable width of the bar.

Some few commutating-pole motors are more subject to flashing than most of the more popular non-commutating-pole design. The reason for this is that when the limitation in design regarding the allowable voltage between segments in non-commutating-pole motors was removed by the development of the commutating-pole type, some designers were led to bring out motors with strong armatures and weak fields, as well as with many armature turns between segments. These motors were very liable to flash, in fact they would flash-over at high speed at almost every bad rail joint. However, it would not be fair to hold this against the commutating-pole motor. Again, in motors properly designed for flashing a small amount of sparking at the brushes in normal operation does not have any harmful influence upon the flashing. This is especially true of the very small arcs at times observed at the brushes of commutating-pole motors, which produce but a limited amount of vapor and require a large voltage to maintain them. This condition follows from the fact that, as the commutating pole is not a safeguard against the establishment of arcs at the brushes under all circumstances, it is necessary to keep down the voltage which tends to carry the arc over.

Ventilation of motors should have a good effect upon flashing and sparking because the ventilation tends to remove carbon and copper dust from within the motor and to keep the motor dry inside. It further removes hot metal vapors which may exist on account of sparking or incipient flashes.

There are two conditions of operation under which almost any rationally designed motor is liable to flash. First, motors are at times subjected to very high over-voltages, for example, in third-rail installations where, when a heavy load is suddenly taken off the line, voltage

risers up to two or three times the line voltage. It would hardly be possible to design commercial motors which would stand this under any condition of load without flashing over now and then. However, the damage caused to an up-to-date motor by flashing under over-voltage conditions is usually negligible, because the high-voltage surges are usually of very short duration. The damage caused by voltage surges through insulation break-downs may, of course, be quite serious. A second cause of flashing and which often results in serious damage to the motor is the practice of throwing the reverse handle of a four-motor equipment, that is "bucking the motors." With the motor connections established under these conditions it is possible for the motors to pick up as generators under practically short-circuit conditions. The rush of current is so great and the building up of the flux so rapid that the induced voltages are very high, and together with the effect of field distortion nearly always cause a severe flash-over if the motor is running at fairly high speed. The practice of throwing the reverse handle while running should not be tolerated except possibly in order to avoid accidents and damage more serious than the burn-out or break-down of a motor.

Electric Railway Earnings

Analysis by Mr. Doolittle Shows Relative Stability of Earnings from Electric Railway Operation

Continuing the studies of electric railway earnings which were published in the *ELECTRIC RAILWAY JOURNAL* of Jan. 23, page 183, and of March 13, page 506, F. W. Doolittle, director of the bureau of fare research of the American Electric Railway Association, has compiled the accompanying table to show the results of economic disturbances during 1913 and 1914 upon the several industries mentioned. Eight of the first nine items included therein are derived from electric railway figures.

TABLE SHOWING COMPARATIVE RESULTS OBTAINED IN SEVERAL INDUSTRIES DURING 1913 AND 1914

	1914 in per cent of 1913
1. Electric railways—net earnings—South.....	104.41
2. Electric railways—gross earnings—South.....	104.19
3. Electric railways—gross earnings—United States (263 companies).....	100.68
4. Electric railways—gross earnings—East.....	100.58
5. Electric railways—net earnings—East.....	99.74
6. Electric railways—gross earnings—West.....	99.69
7. Agriculture—farm crop value—United States.....	99.60
8. Electric railways—net earnings—United States (263 companies).....	99.57
9. Bank clearings—amount—West.....	97.41
10. Electric railways—net earnings—West.....	96.79
11. Steam railroads—net earnings—West.....	94.52
12. Steam railroads—gross earnings—West.....	94.50
13. Steam railroads—gross earnings—South.....	93.72
14. Building permits—value—West.....	93.58
15. Steam railroads—gross earnings—United States.....	93.46
16. Bank clearings—amount—South.....	93.29
17. Steam railroads—gross earnings—East.....	92.31
18. Building permits—value—United States.....	91.86
19. Building permits—value—East.....	91.66
20. Steam railroads—net earnings—United States.....	91.61
21. Bank clearings—amount—United States.....	90.64
22. Bank clearings—amount—East.....	89.89
23. Steam railroads—net earnings—East.....	89.82
24. Steam railroads—net earnings—South.....	86.17
25. Building permits—value—South.....	85.76
26. Steel production—tons.....	75.50
27. Iron production—tons.....	74.20
28. Cotton crop—value.....	63.00

The exhibited data argue, of course, not the relative profitableness of the traction industry but its relative stability. No business operating from year to year under constantly increasing costs and furnishing continually more and better service for a fare which is vastly less when measured in terms of the material and labor it goes to purchase than it was twenty years ago, is likely to be very profitable. The fact that it requires the investment of \$5 to \$7 to produce \$1 of gross revenue annually is a further indication that large profits cannot be expected generally. The electric railways of

the United States carry ten passengers for every one carried by steam railroads. In cities of 8000 population and over, the average individual rides more than 250 times each year. This use is an integral part of the lives and habits of many millions of people, and it is not strange to find it maintained during periods when other habits are changed. Electric railways are an economic necessity and the service they furnish cannot be accumulated or postponed. The further growth of a city is dependent upon the growth of its transportation facilities. The money for these facilities must be obtained in competition with other industries, and it can be obtained only by the willingness to pay a fair return. The essential stability of the volume of traffic operates, when rates are reasonable, to fix this rate of return below that which must be offered to investors in businesses more speculative in their nature, but unless stability of earnings accompanies stability of traffic, the community loses this advantage which its own habits can create.

West Virginia Association Organized

The Public Service Utilities Association of West Virginia, which includes in its membership electric railways, electric light and power and water works companies, held its first meeting in Charleston on June 15 and 16 and effected permanent organization by the adoption of a constitution and by-laws and the election of permanent officers, as follows: President, Herbert Markle, general manager Appalachian Power Company, Bluefield, W. Va.; first vice-president, G. O. Nagle, general manager Wheeling Traction Company; second vice-president, Mentor Hetzer, general manager Moundsville Water Company; third vice-president, James Imboden, general manager West Virginia Light & Traction Company, Charleston, W. Va.; secretary and treasurer, W. C. Davisson, vice-president West Virginia Water & Electric Company, Charleston, W. Va.; executive committee, W. C. Mathews, president Virginia-Western Power Company, Clifton Forge, Va.; Herbert Markle, G. O. Nagle, Mentor Hetzer, O. B. Welch, vice-president and general manager Williamson Light & Power Company, Williamson, W. Va.; W. L. Foster, general manager Beckley Electric Light & Power Company, Beckley, W. Va.; H. S. Newton, general manager Ohio Valley Electric Company, Huntington, W. Va.; E. W. Alexander, general manager Charleston-Dunbar Traction Company, Charleston, W. Va.; W. A. Maxwell, general manager Logan Heat, Light & Power Company, Logan, W. Va.

The object of the association is to promote the interests of public utility companies in the State along educational and political lines.

Lectures to Employees

Periodical lectures to employees on proper relations with the public have been found to be very helpful in reducing complaints to a minimum on the lines of the Twin City Rapid Transit Company, Minneapolis, Minn. A. W. Warnock, general passenger agent and manager of the publicity department, visits each of the company's six carhouses every three weeks and delivers a fifteen minutes' talk to the extra trainmen and as many of the old employees as can attend. Usually the subject discussed relates to public complaints received during the period between the lectures. The cause of the complaint, its disposition and methods of preventing similar complaints in the future are discussed. Complaints afford a new subject for each lecture, and often being of a personal nature, are more interesting than would be a general discussion.

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

H. G. McConnaughy, Director of Transportation for the Convention, Announces the Appointment of Trainmasters for Different Sections of the Country—Program and List of Speakers for Convention
Being Compiled—Activity of Various Association Committees

TRANSPORTATION ARRANGEMENTS FOR THE CONVENTION

H. G. McConnaughy, director of transportation for the convention, has announced the appointment of J. C. McQuiston, manager Westinghouse department of publicity, East Pittsburgh, Pa., as trainmaster of the Blue Special train; Frank H. Gale, advertising manager General Electric Company, Schenectady, N. Y., as trainmaster of the Red Special train, and L. E. Gould, Western manager ELECTRIC RAILWAY JOURNAL, Chicago, as trainmaster of the White Special train. The Red Special train will leave New York about Sept. 23 by way of the New York Central & Hudson River Railroad, thence to Chicago, and thence to St. Paul and Minneapolis over the Great Northern to Glacier Park, Spokane, Seattle, Portland and San Francisco. The Blue Special train will leave a day or two later over the Pennsylvania Railroad by way of Pittsburgh, Indianapolis, St. Louis, Kansas City and Denver, then through the Royal Gorge to Salt Lake City, Ogden and Lake Tahoe to San Francisco.

After the convention the Blue Special will follow the Red Special, visiting the Yosemite Park, Los Angeles, San Diego and Grand Canyon, then via Kansas City and St. Louis to New York. The White Special will be an especially fast train which will make the run for the convenience of those who cannot participate in the earlier tours. It will be a going trip only and will start from Chicago.

Western members who desire to make reservation on the White Special should do so through L. E. Gould, ELECTRIC RAILWAY JOURNAL, 1570 Old Colony Building, Chicago. Reservations for either of the other trains or reservations from Eastern members who wish to take the White Special from Chicago, and requests for information connected with the tours should be made through H. G. McConnaughy, director of transportation, Room 1002, 165 Broadway, New York City, except that members in New England can make reservations through H. E. Reynolds, chairman transportation committee for the New England territory, Bay State Street Railway, Boston, Mass.

The printed itineraries covering all special trains are now on the press and will be ready for mailing within the next week. The delay in getting these out has been caused by changes suggested by the Railway Association and the necessity of rearranging some of the details in connection with the tours. Every detail covering all tours has been carefully worked out, and arrangements at all points covering hotels, side trips as planned and shown in the itineraries have been completed. The ladies and children accompanying each party will have special care and attention. A maid, who will be at their service at all times, will accompany each train.

The requests received by the transportation committee for the different tours have been so heavy that it will be absolutely necessary for the members to make their reservations as soon after the receipt of itineraries as possible, as the number of people who can be accommodated on each special train is limited. Consequently, all assignments will be made in the order in which requests are received.

SPEAKERS AT THE SAN FRANCISCO CONVENTION

The office of the secretary of the American Electric Railway Association is busily engaged in completing the program for the convention in October. A feature will be addresses by a number of distinguished men. These will be in addition to the regular program of reports and papers upon matters of technical interest to the industry. The list of addresses is not completed yet, but a sufficient number of definite promises have been secured to mark the convention this year as an important one in the annals of the association. Several of these special features were announced by Secretary Burritt this week.

The address of welcome will be given by Hiram W. Johnson, Governor of California.

Ex-senator Jonathan Bourne, Jr., will speak on government ownership, a subject which his years of experience in the business of government at Washington peculiarly qualify him to discuss. While United States Senator from Oregon, Mr. Bourne, besides being the author of the parcel post law, was one of the most efficient forces in the national movement for the construction of good roads, and in other matters of countrywide importance. He is one of the most brilliant and forceful writers and speakers in America.

Another address of great interest at the present time will be on "The Fundamental Principles of the Valuation of Electric Railways" by Bion J. Arnold. Besides the office of chief engineer and chairman of the Board of Supervising Engineers, Chicago Traction, which Mr. Arnold has occupied since its establishment under the ordinance of 1907, Mr. Arnold has been consulting engineer of the Public Service Commission, New York City, on matters connected with subway and street railway properties; consulting engineer Detroit United Railway, consulting engineer for the cities of Pittsburgh, Providence, Los Angeles, San Francisco, Toronto, Cincinnati and Kansas City, Mo., member of the electric traction commission of the New York Central Railroad and president of the A. I. E. E. and has held other important offices.

Jesse W. Lillienthal, president of the United Railroads of San Francisco, will speak on "Welfare Work," a subject to which he has given a great deal of attention both before and since his election in 1913 as chief executive officer of the electric railway system in San Francisco. For fifteen years prior to his going to California he was one of New York City's most distinguished lawyers, and has occupied a place no less eminent at the San Francisco bar, of whose association he is the senior vice-president. He is also a director in many of the corporations that have played an important part in the industrial upbuilding of the Pacific Coast.

A fourth address will be given by Ivy L. Lee, recently executive assistant Pennsylvania Railroad and now a member of the personal staff of John D. Rockefeller. A number of Mr. Lee's addresses on different phases of the subject have appeared in previous issues of this paper, and he was the author of an article on "Principles Underlying Publicity" in the issue of Oct. 10, 1914. He will speak in San Francisco on "Putting Publicity Theories into Practice."

TRANSPORTATION STANDARDS

The new committee on standards of the American Electric Railway Transportation & Traffic Association met on July 14-15 and organized. There were present L. H. Palmer, chairman, C. V. Wood, Alexander Jackson and J. N. Shannahan. The committee formulated rules of procedure for the adoption of standards by the Transportation & Traffic Association, this being intended for submission before the 1915 convention. The form of procedure follows very closely, in so far as it is applicable, that of the Engineering Association. Provision is made in it only for two grades, (1) standards, and (2) recommended methods and practices, the former to include such recommendations of the association as bear its formal approval as standard. The latter grade will include all other definitely approved recommendations. The committee also drew up a syllabus covering the existing standards of the association, and it is expected that this will be issued in the early part of next year.

STANDARD STYLE FOR SPECIFICATIONS

A subcommittee of the committee on standards of the American Electric Railway Engineering Association, consisting of A. S. Richey, chairman, J. H. Hanna and S. H. Spalding, representing E. R. Hill, met last week and drafted tentative regulations to govern the style of specifications adopted by the association. These proposed regulations are intended for submission to the committee on standards at its meeting during the latter part of the month, and if approved at that time they will be presented before the association at the 1915 convention.

COMMITTEE ON BUILDINGS AND STRUCTURES MEETS

A meeting of the Engineering Association committee on buildings and structures was held in New York on July 7 with the following in attendance: C. S. Bedwell, Newark, N. J., chairman; H. G. Salisbury, Toronto, Ont.; R. C. Bird, New York, N. Y.; J. H. Frank, Philadelphia, Pa.; William Roberts, Akron, Ohio, and H. G. Throop, Syracuse, N. Y. A proposed form of contract for general construction work was revised and approved by the committee and will go to the committee on standards for approval as recommended practice. The general specification stands practically as it was except that the agreement portion has been greatly shortened and specific clauses have been added to cover the owner in matters relating to protection against mechanics' liens and actions for damages under the workmen's compensation law.

The sub-committee on the proper provision for expansion and contraction in concrete structures, together with provision for waterproofing joints, presented an illustrated report giving engineering data on the subject and suggested provisions as covered by the assignment. The report was approved for presentation to the association for discussion, with the expectation that the work would be continued.

The sub-committee on fire protection rules reported itself as being in accord with the National Board of Fire Underwriters in regard to the rules on the use of soldering and other heating equipment. The committee presented extracts from the Underwriters' building code as they apply to construction employed in electric railway buildings, with the idea of bringing out discussion on the recommendations.

A new sub-committee on the construction and design of substations submitted a report which the general

committee recommended for presentation to the association along with the rules for standard construction prepared by the Board of Fire Underwriters. The committee will submit a plan showing an ideal substation of specified size and also rules and recommendations for details of fireproof construction.

BUREAU OF STANDARDS FOR INTERURBAN RAILWAYS

Ways and means by which a new bureau of standards may be established among interurban railways which are members of the American Electric Railway Association was the purpose of a conference held at Fort Wayne, Ind., the session being attended by James J. Brennan, Fort Wayne & Northern Indiana Traction Company; A. A. Schlessinger, Terre Haute, Indianapolis & Eastern Traction Company; J. A. Kelsey, Union Traction Company of Indiana; M. J. Kehoe, Ohio Electric Railway, and E. J. Burdick, Detroit United Railway. These men were representatives of the Central Electric Railway Association and they form a committee to confer with a committee from the American Electric Railway Association to ask the latter body to adopt a standard of operating interurban trains on the lines of the members of the C. E. R. A. which will be uniform.

Meeting of Canadian Electric Railway Association

The annual meeting of the Canadian Electric Railway Association was held at the Chateau Frontenac in Quebec on June 21 and 22. After the opening address by President C. B. King, manager London Street Railway, Secretary-Treasurer Acton Burrows, managing director *Canadian Railway and Marine World*, gave a detailed report covering the association's activities during the year and a wide variety of other topics. W. F. Graves, chief engineer Montreal Tramways and chairman of the special committee on the proposed standardization of steel rails for electric railways, presented a report which was referred to the new executive committee.

Copyrighted papers, to be distributed only to officials of member companies, were read as follows: "Development of Tourist Traffic on Observation Cars," by R. M. Reade, superintendent city division Quebec Railway, Light, Heat & Power Company; "A Proper Accident Department," by C. L. Wilson, assistant manager Toronto & York Radial Railway; "Jitney Competition," by E. P. Coleman, general manager Dominion Power & Transmission Company; "Coasting," by A. Gaboury, superintendent Montreal Tramways; "Economy in the Electric Railway Repair Shop," by E. A. W. Turbett, mechanical superintendent Quebec Railway, Light, Heat & Power Company, and "Methods to Minimize Fire Risks and Secure Reduction of Premiums," by J. H. Ryan, New York.

Officers for the ensuing year were elected as follows: President, James D. Fraser, director and secretary-treasurer Ottawa Electric Railway; vice-president, E. P. Coleman, general manager Dominion Power & Transmission Company; honorary secretary-treasurer, Acton Burrows. The new executive committee includes: A. Eastman, vice-president and general manager Windsor, Essex & Lake Shore Rapid Railway; A. Gaboury, superintendent Montreal Tramways; H. G. Matthews, general manager Quebec Railway, Light, Heat & Power Company; M. N. Todd, president Galt, Preston & Hespeler Street Railway; C. L. Wilson, assistant manager Toronto & York Radial Railway.

COMMUNICATION

Motor Ventilation

KANSAS CITY, Mo., July 10, 1915.

To the Editors:

There have been several interesting and instructive articles on the advantages and limitations of ventilated motors published in the *ELECTRIC RAILWAY JOURNAL* within the past few months. Before the appearance of these articles the receivers of the Metropolitan Street Railway Company of Kansas City had contracted for fifty four-motor equipments of the ventilated type for cars which have since been delivered, and it has been suggested to the writer that perhaps the street railway operators generally may be interested in knowing what considerations affected the choice of these motors.

It is recognized that the service conditions under which motors are expected to perform have an important bearing upon the design selected, and as the conditions under which motors operate in the two Kansas Cities are very severe there are hereinafter given the service requirements under which the new motors are expected to perform, as well as the circumstances which guided the Board of Control of the Kansas City properties in deciding upon the selection of the ventilated type of motor for service under these conditions.

The specifications under which the motors were purchased set out the service conditions under which the equipment would be required to operate as follows:

Weight of empty motor car completely equipped without motors and gears and gear cases.....	32,500 lb.
Average load of passengers and crew.....	4,500 lb.
Maximum load of passengers and crew.....	18,000 lb.
Typical run.....	Troost Avenue
Length of round trip.....	10.6 miles
Morning rush-hour running time (excluding two-minute lay-over time).....	66 minutes
Mid-day running time (excluding two-minute layover time),.....	63 minutes
Evening rush-hour running time (excluding two-minute lay-over time).....	68 minutes
Average trolley voltage.....	525 volts
Average stops per round trip.....	.77
Average length of stop.....	9 seconds
Diameter of wheel.....	30 in.
Maximum grade.....	9½ per cent
Other excessive grades.....	<div style="display: inline-block; vertical-align: middle;"> <div style="display: inline-block; vertical-align: middle;">800 ft. of 8 per cent grade</div> <div style="display: inline-block; vertical-align: middle;">4300 ft. of 3½ per cent grade</div> <div style="display: inline-block; vertical-align: middle;">3100 ft. of 5 per cent grade</div> </div>
Average rate of acceleration and braking.....	1.75 m.p.h.p.s.

In addition, the manufacturer was required to guarantee that after continuous running, including both the morning and evening rush, carrying during the total time the average loads above indicated and also including two successive round trips during evening rush with loads of 80 per cent of the maximum indicated over the entire out-bound trip only, no part of the motors would show a temperature rise exceeding 70 deg. C. above the temperature of the surrounding air, excepting the commutator, which might show an 80 deg. rise.

As a result both of the bids received and of detailed investigation into the whole subject, as applying to local conditions, the following conclusions were drawn:

1. There is a very perceptible decrease in weight by use of the ventilated type of motor.
2. That the service or continuous capacity of the ventilated motor was from 40 per cent to 50 per cent above that of the non-ventilated motor, having the same one-hour rating, assuming that the proper balance of design exists in each.
3. That on a basis of the same continuous capacity, the cost of the total equipment of the ventilated motor type was from 20 per cent to 25 per cent less than that of the non-ventilated type of motor.
4. That the temperature was maintained more uniform throughout the motor in the ventilated type.
5. Owing to the elimination of hot spots, the maintenance of the ventilated type should be materially less.

As to the objections, the fact that water might enter the ventilated type of motor and put it out of commission was raised as a serious objection, in that we have many stretches of track located in low spots, subways, etc., subject to overflow, and were this objection well taken we would not have been able to use the ventilated type. However, it has been our experience that the non-ventilated type of motor being also provided with drain holes in the bottom of the frame cannot be operated through water with the current on. In other words, so far as the damage from water is concerned it is virtually on the same plane as the ventilated type of motor. The second objection was that of the possibility of dust accumulating in the air passages, preventing the dissipation of heat and causing ultimate breakdown. This condition was found to be more inherent to the duct type of armature, and difficulty was not expected from this source, as the motor was so designed as practically to eliminate dust pockets. Good maintenance demands that motors of all types should be regularly blown out and cleaned, and we expect to remove all possible difficulty by giving the motors the care they should receive when on the pits. It was also stated that snow would cause trouble, but we believe the design of the motor is such as to make it exceedingly difficult for even a slight amount of snow to enter, or only so little as would cause no trouble.

Therefore, so far as the bids received were concerned and in view of the guarantees given, it was our experience that we could get a lighter motor of greater service capacity with less maintenance cost at a 20 per cent to 25 per cent decrease in price. There could hardly be a question as to the choice made under these circumstances.

PHILIP J. KEALY.

Specifications for Track Material

At the recent convention of the American Society for Testing Materials specifications were presented to cover heat-treated high-carbon-steel splice bars. These conform quite closely to the recommended specifications for untreated hard-steel splice bars of the American Electric Railway Engineering Association, except, of course, as regards the heat treatment. The practical points of difference in the two specifications are that the A. S. T. M. provide for a check analysis from finished bars by the purchaser if desired, with an increase in the phosphorous content of 25 per cent over the ladle analysis; that the bend-test arcs are 50 per cent greater in the A. S. T. M. specifications, and that a variation in size of hole of only 1/32 in. is allowed by the A. S. T. M. Provision is made for the retreatment of bars that failed in tests, one or more heat treatments being allowed.

At the same convention specifications were presented for heat-treated steel track bolts, and a revision was submitted for the existing standard specification of the A. S. T. M. for yellow-pine bridge and trestle timbers, this applying to solid members and not to composite members.

The Boston Elevated Railway has converted a small open car into a traveling display of scenes in parks on or near the local system and will operate the equipment over many routes during the coming months. On each side of the car are mounted three oil paintings illustrating scenes at Norumbega, Franklin, Marine and Lexington Parks, with large maps showing the location of these breathing spaces as well as the Blue Hills and Middlesex Fells. The canvases call attention to the natural and artificial attractions at these outing places. In place of the usual destination signs the car carries the designation "Trolley Outings."

Equipment and Its Maintenance

Experimental Open-Car Reconstruction in Atlantic City

BY GEORGE F. FABER, GENERAL SUPERINTENDENT ATLANTIC CITY & SHORE RAILROAD

Two old-style, open, running-board cars were remodeled by this company for this season's traffic into center-entrance cars as shown in the accompanying illustrations. The open-car feature was retained as an absolute necessity in a seashore resort like Atlantic City, where the principal attraction to visitors, as far as car riding is concerned, is a ride down the coast in some kind of an open car. By the adoption of the plan described below it would seem possible to get every advantage of the pay-as-you-enter method of car collection and additional protection from accident hazard without sacrificing any of the advantages of the old type of car excepting seating capacity.

While it is not claimed that this construction is an entirely novel one, there are some features different from those previously described in the columns of the ELECTRIC RAILWAY JOURNAL.

The remodeled cars were twelve-bench cars, 39 ft. 6 in. over bumpers in length, 7 ft. 10 $\frac{1}{2}$ in. over side-posts in width, the floor level being 2 ft. 10 in. above the rails. They were equipped with double trucks, 25 ft. 6-in. on centers with 30-in. wheels. The trucks were of the Brill 27G type.

In remodeling, one side sill was dropped at the center to provide three step heights, 10 in., 10 in. and 14 in. respectively. A drop girder was added to stiffen the sill. On one car we put a Prepayment Car Sales Company door with step-controlling mechanism, and on the other a J. G. Brill Company equipment. On each car a conductor's stand was located as shown in the drawing. In arranging for the seating, as shown, the rear bulkhead was removed and only the seat behind the front bulkhead was retained. The two plans used in inclosing the sides for a height slightly more than 3 ft. above the floors are shown in the accompanying half-tones. In one a sheet-steel sheathing was applied for half this distance and a substantial screen for the remainder. In the other the screen was used alone. The former plan gives a more finished appearance to the car, while the latter allows a somewhat better circulation of air.

A specially-arranged spring seat is provided for the

RECONSTRUCTED OPEN CARS—DETAILS OF ENTRANCE, SEATING, ETC.

motorman which is removable when not in use. The register is operated by the conductor by means of a foot-lever-control mechanism running under the car floor. A Consolidated Car Heating Company buzzer system permits the passengers to signal to the conductor, who in turn signals to the motorman by means of a bell operated from a push-button arranged handily on the operating stand.

Conditions in Atlantic City are such that a larger car than that now in use could be operated to advantage, conditions being favorable to trailer operation, although the company does not favor such operation at present. While it is true that a larger seating capacity is desirable, it must be remembered that the Atlantic City season is short and the traffic very variable, so that a smaller type of car used in numbers to suit the traffic can always be operated to advantage. After all, a good, safe, service car with as many of the features of the open-bench car as can be obtained is what is most needed.

The Atlantic City & Shore Railroad has a large number of near-side cars in which the "in-and-out" plan is used, while on the experimental cars the "all out" and "all in" plan is used. The result is that there is a little confusion this summer on the part of passengers. This confusion was unavoidable, however, in the carrying on of the present experiment. The center-entrance plan was devised partly to avoid confusion and extra walking on the part of the passengers which would have resulted had the rear-entrance and front-exit plan been adopted. This would have been prefer-

RECONSTRUCTED OPEN CARS—REMODELED CAR WITH SCREENS ONLY

RECONSTRUCTED OPEN CARS—REMODELED CAR WITH STEEL SHEATHING

able in many ways but it would not have worked in well with the use of near-side cars.

From the experience with the reconstruction of the two samples the cost records show that if the cars can be put through the shops in lots of ten the cost of remodeling each car will not be more than \$550. These cars will be run during the present season experimentally before plans for remodeling additional ones are worked out.

Motor-Bearing Trimmer

BY E. L. STEPHENS, MASTER MECHANIC, LOS ANGELES (CAL.) RAILWAY

Having adopted a standard babbitt-lined motor bearing, special forms have been made by the Los Angeles Railway for use in rebabbitting them. All bearings are trimmed and oil-grooved before they leave the shops for the different divisions. However, owing to our company having a gage of only 3 ft. 6 in., we have no room

MOTOR BEARING TRIMMER USED AT LOS ANGELES

for an axle collar. Hence it is necessary to face all wheels hubs for a motor brass collar bearing. As there is a slight variation of the distance between the motor and wheel hub, the motor brass collar cannot be completed for service at the shops. This slight variation is overcome by using a home-made motor-bearing trimmer, with which every division is furnished. This shop kink consists of a self-centering clamp attachment which holds the bearing firmly, and attached thereto is a rotary automatic self-feeding cutter which is operated by hand, to trim the collar to any desired length. This little machine eliminates all lathe work, and as it is automatic it can be operated by any employee. Its operation is such that the trimming of a pair of bearings can be completed on this trimmer in less time than it would take to center the bearings on a lathe.

Record time was made by the Chattanooga Railway & Light Company, Chattanooga, Tenn., in replacing the old cables on the Lookout Mountain incline. Heretofore several days have been required to complete the installation of the new cable. This year the exchange was made in two days. The cables have to be renewed about every two years.

Railway Motor Gearing

BY W. L. ALLEN, COMMERCIAL ENGINEER R. D. NUTTALL COMPANY, PITTSBURGH, PA.

As a result of the presentation of a paper by the writer on "Railway Motor Gearing" at the recent meeting of the Central Electric Railway Association, abstracted at length in the issue of the ELECTRIC RAILWAY JOURNAL for June 26, page 1201, a number of questions have been asked. In the belief that the answers to these questions may be of interest to railway men other than those who propounded the questions, these answers are given with the questions in the following paragraphs:

Question No. 1.—How will the railways which purchase gearing to specifications know whether the material so purchased meets the specifications?

Answer.—The railways with inspection and testing departments can arrange to have all material on order tested and inspected before shipment. In that case the manufacturer must provide the proper facilities for such testing and allow the inspectors free access to his plant at all times during the course of manufacture of the material. Properties not having such testing departments can have this work done for them by commercial testing laboratories, or can secure from the manufacturers test reports covering any materials shipped on their orders. If the number of pieces on order is sufficient to warrant a physical test, the report should show the physical properties of the piece selected to represent the lot, while the surface hardness of each piece can be identified by a serial number plainly stamped on each gear and pinion appearing in the report. For example, a typical test report might be as follows:

Customer's order No.....
Date.....
Invoice No.....

SERIAL NUMBER	SURFACE HARDNESS
518-363	555 Brinell
518-364	532 Brinell
518-365	555 Brinell
Test Taken *518-366	512 Brinell

If a physical test is made, the serial number of the gear or pinion from which the test piece was machined and the physical properties should be shown as follows:

Test Taken * Serial Number 518-366	Surface Hardness 512 Brinell
Ultimate tensile strength.....	125,425 lb. per sq. in.
Yield point	85,500 lb. per sq. in.
Elongation in 2 in.....	16.4 per cent
Reduction of area.....	41.9 per cent

Question No. 2.—Will the purchase of gearing to specifications increase the cost of this gearing?

Answer.—Each variation in the chemical composition of the steel used in the manufacture of gearing, or in the temperatures and duration of heating and cooling during heat treatment, or in fact any variation in the process, tends to produce non-uniformity in the resultant material. To insure against such non-uniformity the progressive, conscientious manufacturer has found that it is necessary constantly to test his product in practically the way described in the C. E. R. A. paper. The sale to specifications, therefore, should only require the additional work made necessary by the reporting of this test information to the railway and should not increase the purchase price of such gearing. It will, however, have a tendency to increase the cost of production of the unscientifically manufactured material, which increase will be more than compensated for in the increase of the life and efficiency of this class of material.

Question No. 3.—Will the purchase to specifications relieve the gearing manufacturer of his responsibility for breakage or poor life?

Answer.—The equitable adjustment of claims and

complaints, which is of as much value to the purchaser as to the seller, requires first determining the exact cause of failure. The purchase of gearing to trade names, without a comprehensive knowledge of the characteristics of the material on the part of the purchaser, is apt to produce an unsatisfactory situation in the event of failure, due to the natural tendency of both parties involved to feel that the failure lies within the other's sphere. On the other hand, when supplies are purchased to specification the determining of the cause of failure is greatly simplified by following a natural course of inquiry. If, for instance, the unsatisfactory material failed to meet the specifications, placing the responsibility is not difficult. If it meets the specifications, the failure may be due either to defective installation, operation or maintenance, or to a wrong application of the particular grade of material in the specific service. By a process of elimination an investigation may show that the failed material was only an isolated case due to some error as in the above list, or it may show that some inherent weakness exists in operation or maintenance methods which can be entirely corrected. If there should be an epidemic of such failures in a specific service and caused by operating conditions not possible of change, such an investigation may develop the fact that a grade of gearing of greater strength, toughness or surface hardness must be used.

Now, while an elaborate investigation is impracticable in each instance, the intelligent consideration of the above outlined phases of gearing operation and maintenance conducted by the manufacturer, together with the operator, cannot fail to educate the manufacturer as to the service to which his material must be subjected, as well as permit the operator to learn the requirements of gearing for his service. This mutual education will undoubtedly greatly minimize failures and increase possible economy through wise selection, as well as provide the necessary data for satisfactory adjustment. It would seem, therefore, that rather than relieve the manufacturer of his responsibility, purchase to specifications increases this responsibility and in reality leads to his rendering a service to the railway of unlimited value in the selection of that grade of gearing best suited to the specific service in question.

One-Man Cars at San Francisco

The United Railroads of San Francisco now has in operation three double-truck and six single-truck cars in one-man service. All are used on outlying lines where the receipts average less than \$1 per car-hour. New cars were not bought for this service, old rolling stock being rebuilt for the purpose. The principal changes made in the double-truck cars were the locking of the rear platform, the installation of folding steps and air-operated mechanism for opening and closing the sliding doors. The same changes were made on the single-truck cars except that hand-operated mechanism was installed for the doors. The double-truck cars are fitted with Johnson fare boxes, while the single-truck cars have the customary register mechanism with overhead rod connections. The fenders at each end of the cars are lowered at all times, and double poles and bases also are provided so that the car operator need not leave the car when changing the running direction.

The first one-man cars were installed about two years ago, the service being gradually increased to the number previously mentioned. The company contemplates the conversion of the Pacific Avenue cable line, using seven cars, to one-man operation after the Panama-Pacific Exposition has been closed. Like the other one-man cars they will be rebuilt at the company's shops.

Out-Door Light Clusters

Because of the demand for light clusters that will stand all kinds of weather the G. E. Painter Company, Baltimore, Md., has brought out a number of improved designs of the five-lamp and single-lamp types which can be fitted with enamel signs and signal lenses for crossings, stations and similar locations where light is needed. All of them are made of cast iron of about 3/16-in. thickness, and as they are heavily galvanized they should have long life. The bodies are fitted with porcelain Edison receptacles, held in place by brass screws so that they can easily be replaced in the event of breakage.

The receptacles for the five-light clusters are connected in series to suit the 550-volt railway current, and are so arranged that they cannot become short-circuited or grounded by rain and snow, or damaged by lightning. In case it should be desirable to change the cluster to

SIDE-SUSPENDED FIVE-LIGHT CLUSTER AND TOP-SUSPENDED TYPE WITH LENSES AND LAMP GUARD

the three-light or four-light type, so as to use lamps from the series of five for other purposes, it is an easy matter to make the necessary connections without "bridging" the cluster receptacles.

The lens holders or shields for the clusters are also made of galvanized cast iron, these being arranged to suit 4 1/2-in. semaphore lenses, and porcelain enamel signs as shown in the accompanying illustrations, can be attached as desired. The holders or shields are held in position by means of brass screws, and the drilling is such that either one or two lens holders can be used in connection with the clusters. The lens holders are arranged to be placed on one of the three sides of side-supported clusters, and on four sides of the top-suspended type to suit the different conditions, but when two holders are used they must be placed opposite to each other, as the shield extends more than one-fourth around the body of cluster. The top-suspended clusters

SINGLE-LIGHT SIGNAL WITH LENSES AND SIGN

may be hung either from a bracket or from a span wire, as most convenient, the side-suspension type being specially designed for attachment to a wall or pole.

Universal Register for Electric Railway Service

Ohmer's "Universal" register is the latest fare-protecting device manufactured by the Ohmer Fare Register Company. It has been built in response to the growing and insistent demand for an indicating and recording fare register which will handle all denominations of cash fares, whether the amounts be in odd pennies or

VIEW OF UNIVERSAL TYPE OF REGISTER

not, and which will also register all tickets, mileage tickets, etc., according to their actual cash value.

The use of the register will permit inter-urban railway companies at any time to change their fare rates quickly and without the necessity of any change in the register mountings or mechanism. The register can also be used interchangeably on any division or can be operated even over the lines of another company without any mechanical readjustment whatever.

Notwithstanding its large capacity, the machine itself is compact in appearance and is simple and positive in operation. Any cash fare or ticket value from 1 cent to \$9.99 inclusive can be quickly registered and simultaneously indicated and the amount thus indicated cannot be changed until a fare of a different denomination is registered.

With this register tickets are recorded in two ways—as a ticket in the "ticket" column, and as cash in the "cash" column. These two registrations are made simultaneously and with no more trouble than a single registration, in fact, the operation really is a single registration. The turn-in is checked also in two ways, the number of tickets received being checked against the ticket column and the cash value of the tickets received being checked against the cash column. In this case the tickets are counted in as so much currency and according to their actual cash value. This method of registration and checking is the same in the case of mileage tickets. The strips lifted are registered as tickets and the cash value of each strip is added to the cash column by the register. The balance in the cash column after deducting all ticket values is the actual cash collected by the conductor.

Special attention should be given to the thoroughness and accuracy of the check secured by this method of registration and its effectiveness in preventing substitution of any kind. The register indicates exactly the kind of fare being registered and also its value, and the public indication is very plain and absolutely unmistakable.

The new design contains a number of improved features not found in the earlier types of Ohmer registers and these make it absolutely foolproof. Among these are the following: At the completion of each conductor's run all printing counters are turned back to zero with the exception of the total passenger and total cash

counters. This provides a check between the records of successive conductors, and between the closing figures of one day and the opening figures of the next. The register cannot be operated unless the detail counters are previously turned to zero. The conductor then takes an imprint with his identification key in the register. His identification key is locked in the machine with the registration of the first fare, and it cannot be removed until he has taken a final imprint to close his day's report. Neither can the conductor operate the register after he has turned the total passenger indicator to zero unless he takes an imprint of the fares registered up to that time.

A record sheet from the new register is shown in the accompanying illustration. From this will be seen the large amount of useful data contained in the small space. The time, the direction, the train or trip number, the date, and the conductor's and inspector's identification key numbers are regular Ohmer features and are self-explanatory.

The register from which this record is taken is mounted to record pass, transfer, ticket and cash. Reading from left to right the last print made by conductor 237 at 12.30 p. m. (the fourth line from the bottom) it appears that he registered sixteen passes, twenty-two transfers and sixty-seven tickets and cash or cash values amounting to \$64.80, the latter being found by deducting the first from the last print in the total cash column. The deduction in the total passenger column shows that there were carried a total of 119 passengers. By deducting the total number of paper collections from the total passengers the number of cash-

TIME	DIRECTION	TRAIN NO.	PASS	TRANSFER	TICKET	TOTAL CASH	REGISTER NO.	TOTAL PASSENGER	DATE	IDENTIFICATION

VIEW SHOWING TYPICAL REGISTER RECORD FOR TWO CONDUCTORS

paying passengers is ascertained, which in this case is 14. In general the register has been built for practical utility and to produce a condensed report, rather than for elaborate headings and unnecessary data which would necessitate more complicated and a less easily operated machine.

In the operation of the register no ticket can be registered unless a cash value is also registered and indicated, the cash indication appearing adjacent to the word "ticket." For example, if a ticket valued at \$1.61 is registered the indicator reads "Ticket \$1.61." If the amount collected is actual cash the indicator reads "Cash \$1.61" and the register is locked against operation if the indicator is made to read "ticket" or "cash" with no cash amount following. Where "Pass" or "Transfer" are registered and no cash value is assigned the indicator simply shows "Pass" or "Transfer" and the space for the cash indication remains blank. All indications appear in the face of the register and are duplicated in various parts of the car by the auxiliary

indicators so that every passenger becomes immediately aware of each transaction. The auxiliary indicators are plain and easily read and follow the full reading of the register. The operating rod is equipped with sets of grips at convenient intervals and the process of selecting the fare to be registered is quickly and easily accomplished.

Ground Fittings for Lightning Arresters

The Electric Service Supplies Company has recently extended its line of Garton-Daniels ground fittings to include material for both $\frac{3}{4}$ in. and 1 in. pipe, and to take the various standard sizes of wire and cable used for grounding lightning arresters, pole and station apparatus, overhead ground wires, etc.

The brass cap shown in the accompanying illustration is furnished with a lug for soldering to the ground wire from the arrester. Certain types are furnished drilled to accommodate $\frac{1}{4}$ -in. cable for grounding overhead ground wires. The pipe couplings are used for connecting two sections of ground pipe. They are particularly useful where the practice of the operating company calls for the extension of the ground pipe 8 ft. or 10 ft. up the pole, and under these conditions it is readily seen how much more convenient it is to drive first an 8-ft. length into the earth and then couple on

GROUND POINTS, COUPLING AND CAP FOR LIGHTNING ARRESTER CONNECTIONS

the extension, than it would be to drive a 16-ft. length. The brass couplings, as illustrated, are employed in grounding lightning arresters on electric railway systems to accommodate either the wire or the free end of a stub-end terminal bond in tying in the lightning arrester ground to the rail.

The ground pipe points are of malleable iron, heavily galvanized. The external type of ground point is generally to be preferred. It is of slightly greater diameter than the pipe and in driving opens a hole in the earth of a diameter slightly greater than the diameter of the pipe. This decreases the friction on the surface of the pipe as it is being driven, and allows the pipe to be easily driven to the proper depth without danger of bending or splitting. After driving, the earth gradually closes in tightly around the pipe, and in an hour or so a thoroughly efficient and reliable ground is secured.

Internal ground points are designed with a head suitably proportioned to fit snugly inside an iron pipe. Their external diameter is the same as that of the pipe. They may be used only in soft earths because the point, being of the same diameter as the pipe, does not open up the earth for its driving. The friction that is exerted on the outside of the pipe renders driving to the proper depth very difficult because the pipe itself will in many instances bend or open up. Where the soil is soft internal points may be used, but where there is much rock or clay in the soil external points should be used.

Quick-Acting Adjustable Seat for Motormen

The Railway Specialties Corporation, New York City, has brought out a new quick-acting adjustable seat for motormen which has been designed especially with regard to light weight, so that it can be transferred from one end of the car to the other with a minimum of effort. The adjustable feature of the seat is entirely new, and this permits raising it to any desired height merely by lifting it. The seat mast is notched, and a gravity dog is provided on the sleeve in which the mast slides, the point of the dog holding the mast in position by engagement with the notches on the mast. In order to lower the seat the gravity dog is touched, thus releasing it from the notch in which it is caught and permitting the seat to fall to its lowest position. The seat can thus be adjusted between a height of 24 in. and 31 in. from the floor. A dowel set in the side of the seat mast travels in a slot that is cut in the sleeve and prevents the seat from turning with relation to the sleeve. No other parts are involved in the construction so that its simplicity and ruggedness are obvious, the accompanying illustration showing these features to excellent advantage.

ADJUSTABLE SEAT FOR MOTORMEN

Combination Cable Insulator and Splicing Sleeve

A new type of insulator in combination with a splicing sleeve for underground cables has just been brought out by the Drew Electric & Manufacturing Company of Indianapolis. The device is especially valuable in reducing electrolysis troubles as it serves to destroy the conductivity of the cable sheath by dividing it into short sections insulated from each other. It also eliminates the danger of leakage at the splice and may be

CABLE INSULATOR PARTLY DISSEMBLED

used to excellent advantage in manholes at building entries, preventing the cable sheaths from collecting stray currents from the pipes or other cables on the same support. It may be used also to separate cables that are grouped near power-house switchboards.

The device consists of a high-grade porcelain tube, 12 in. long, with malleable castings leaded onto the ends. Each of the castings has a $\frac{3}{8}$ -in. gas-pipe plug hole in it, and on the center line are cast-brass tubes which fit the cable sheath and screw into the malleable castings. To install the device the brass end tubes are unscrewed and slipped over the ends of the cables that are to be spliced. The main body of the insulator is

then slipped over one cable end and the splice is made in the usual manner. The insulator is then drawn over the splice, the brass end castings are screwed into place, and wipe joints are made between the ends of the brass castings and the cable sheath. The insulator is then filled with splicing compound through the gas-pipe plug holes and the plugs screwed into place, leaving the splice protected absolutely from mechanical or electrical damage. The weight of the complete device is 17 lb., and it is made to suit any size of cable.

Hamilton Electric Incline Railway

A complete electric hoist equipment has recently been installed by the Hamilton Mountain Park Company, Ltd., Hamilton, Ont., Canada, to operate its incline railway for transporting passengers, freight, automobiles, trolley cars, teams, etc., up the "Mountain," as it is called. This incline gives access to a large tract of land owned by the company at the top of the mountain and also to the fertile country beyond. The "Mountain" is really the Niagara escarpment, as the high bluffs behind Hamilton are prolongations of the heights at Queenstown, over which the Niagara River originally flowed before cutting back the gorge to the present falls, the difference in elevation between the general level of the city and the plateau back of the bluffs being 325 ft. The railway was formerly operated by a steam-hoist equipment, but this had become inadequate to handle safely and quickly the rapidly increasing traffic, and had to be replaced with electric equipment which was furnished throughout by the Canadian General Electric Company, Ltd.

ELECTRIC HOIST

In this arrangement a special double fixed-drum, double-gear electric incline hoist, built by the Lidgerwood Manufacturing Company, New York, operates two large platform cars in balance on an incline 800 ft. long with a grade of 40 per cent. Each car weighs 30,000 lb. and runs on tracks having a gage of 12 ft. 1½ in., the distance center to center of the tracks being 20 ft. 3 in. The average load on the cars is about 20,000 lb., reaching a maximum of 30,000 lb.

HOIST MOTORS, SOLENOID BRAKES AND FLYBALL GOVERNOR

The time required for making a single trip is ninety seconds, and the rest period between trips is three minutes. Attached to each car are two ropes of 1½-in. diameter, one of these being used for hauling the car, and the other for the purpose of safety. The average rope speed during the run is 585 ft. per minute.

The hoist is located in a house part way up the slope and the control is placed in an operator's cabin at the level of the summit. The main rope from the right-hand car is wound over the top of the right-hand hoist drum. The main rope from the left-hand car is wound underneath the left-hand hoist drum. The safety rope from the right-hand car is led over suitable deflecting sheaves to the top of the left-hand drum, and that from the left-hand car is wound over suitable deflecting sheaves to the bottom of the right-hand drum. Each of these sheaves is 7 ft. in diameter. There are four head sheaves and four deflecting sheaves. The former are arranged vertically so as to carry the hoist ropes and safety ropes in a direct line from the cars; the deflecting sheaves are placed horizontally at such an angle that the rope will be led in a direct line either to the top or bottom of the hoist drums, as the case may be.

VIEW FROM TOP OF HAMILTON MOUNTAIN PARK ELECTRIC INCLINE

The reason for reeving the safety ropes as outlined is that in case of an accident to the left-hand side of the hoist, the safety rope on the left-hand car would take care of it properly, being wound on the right-hand drum. The same thing would apply if the other drum of the hoist should become disabled; that is, the main ropes and the safety ropes from each car lead to opposite drums. Further advantage is gained by the fact that each drum is equipped with an independent double-acting brake, and in case either of the main ropes should fail, the safety rope will hold the cars. Furthermore, the safety rope, if called upon to take the load, will be controlled by all the automatic brake features in exactly the same manner as when the load is being handled by the main ropes. In actual operation the length of the safety ropes is slightly more than that of the main hoist ropes, thereby relieving the safety ropes of any hoist stresses other than those required to keep the ropes themselves in motion.

OPERATION AND SAFETY APPLIANCES

The operator's cabin is fitted with an electric controller and two hand-brake levers. The levers will not be used ordinarily, as the hoist is equipped with solenoid brakes operating on the motor shaft. The hand brakes, therefore, need be used only for locking the cars at the top and bottom positions or for cases of emergency. In starting a run the operator releases the drum-post brakes by the hand levers, puts his foot on a small foot pedal located at the bottom of the master controller, and then, by moving the handle of the controller either to the right or to the left, as the case may be, will start the cars, automatic acceleration to the normal rope speed being provided. At a predetermined point on the incline the controller will be automatically turned to such a position that the speed will be cut down to one-tenth of the normal and finally be turned to the off position, thus setting the solenoid brakes and bringing the cars to rest. Should the operator become disabled during a run, he will of necessity remove his foot from the foot pedal, thereby cutting off the current and bringing the cars to rest.

In case the cars should stop short of their landing positions, due to the automatic overwinding mechanism, there are available two or three points on the controller so that the operator can bring them to their proper positions. Should the cars fail to stop, due to the fault of the controller, an overwinding device is attached which will shut off the current and set the solenoid brakes. Should the speed of the cars exceed the normal by a predetermined amount, an overspeeding device is so arranged that it will trip a weight of 570 lb., which will set the drum-post brakes. This overspeeding device, or governor, is of the flyball type, and it will be caused to operate by an excessive speed, whether due to the motor or a breakage of the hoist parts. The emergency weight may also be tripped manually from the cabin.

Power is supplied in the form of three-phase, twenty-five-cycle alternating current, and for changing this into direct current there has been installed a motor-generator set of sufficient capacity to supply the average demand of the hoist, plus some surplus for charging a large storage battery. The direct-current end of the machine is rated at 165 amp. continuously at 550 volts, the latter being the floating voltage of the battery, and it is designed with a special drooping characteristic by means of a reversed series field for the purpose of throwing load fluctuations on the battery. A small percentage of the load fluctuations falling on the machine will lower its voltage to such an extent that the battery must discharge and furnish the balance of the momen-

tary demand. The regulation is, therefore, inherent in the design of the machine, and is entirely automatic. The hoist is driven through two gear reductions by a General Electric 180-hp. motor which is specifically designed to stand such voltage variations as come from a storage battery when it is frequently charging and discharging. A reserve 180-hp. motor and solenoid brake are provided.

STORAGE BATTERY

The storage battery was built by the Electric Storage Battery Company of Philadelphia. Its capacity is 200 amp. for one hour on a continuous discharge, and the makers estimate that it will operate the hoist under the average load conditions for nearly two hours with the power supply entirely cut off. Under normal conditions, with the motor-generator supplying the average load, the battery does not become exhausted, but receives back sufficient charge during the period of rest between trips to make up for the discharge while the hoist is in operation.

Extensible Trapdoor for Passenger Cars

The Pennsylvania Railroad Company has built at New York Terminal, Manhattan Transfer, Rahway and North Philadelphia high station platforms, and has under construction at the present time similar platforms at Wilkinsburg and Johnstown, on its Pittsburgh Division, this being in line with the policy of obtaining the best of railroad features. The advantages of the high platform are, of course, obvious, but a difficulty has arisen in connection with it where the station is located on a curve, because a gap then exists between the

VESTIBULE TRAPDOOR IN RAISED AND EXTENDED POSITIONS

ends of cars and the platform edge. In consequence, the company has equipped for trial a steel vestibule car with an extensible trapdoor as shown in the accompanying illustrations which is designed to bridge this gap. The design is patented by Ellwood H. Sickels of Narberth, Pa.

In operation when the trap is down, the opening of the vestibule door causes the sliding portion to extend, and the closing of the vestibule door retracts it. This arrangement is ideal in view of the fact that the extension of the trap is required simultaneously with the opening of the door, and, as the vestibule door is re-

quired to be closed when the train leaves the station, the trap is necessarily returned at the same time. Furthermore, the physical effort required to open the vestibule door is utilized to extend the trap.

There are, however, certain times when the trap should not extend when vestibule door is opened, as in the case when trap is to be raised so that the steps can be used or when the brakeman opens the door while the train is moving. To provide for this necessary feature, an ingenious, but still quite simple, arrangement is provided by which the connections can be thrown out of gear through the operation of a small handle set flush in the side of the vestibule at a convenient height. It is

PLAN AND SECTION OF EXTENSIBLE TRAP DOOR

not necessary to provide extra trainmen to attend to the operation of the trap, because when the small hand lever is set in proper position (which is done by the brakeman before the train reaches the station) the opening of the vestibule door, whether accomplished by trainman or passenger, will cause the trap to be extended. Owing to the fact that the top plate does not slide, it is, of course, impossible for passengers to be thrown by the movement of the extension. Furthermore, it is impossible for passengers to stand on the trap while the door is being opened.

The trap is, in outward appearance, like the ordinary trap, and consists of a rubber-covered top plate and the extensible portion which is built in the familiar paneled pattern, and acts as a support for the top plate. The two parts are hinged on a hinge rod so that they act together when trap is raised for the use of the steps. The hinge rod is hollow and accommodates the flat springs which are adjusted at the usual bracket, to obtain the proper tension to raise the trap. The extensible portion of trap is supported by means of a bracket (marked E on the line cut) which slides on hinge rod, and also by means of lug F', attached to top-plate bracket F. When the trap is extended, owing to the fact that it is supported at one side on lug F', and at the opposite side on the usual angle-iron ledge, the extended portion cannot deflect when passenger steps on it. The usual spring catches, marked G and H, are used respectively to hold trap down when door is closed and to hold it up against vestibule door when trap is raised for use of steps.

The operating device consists of the bell crank lever J, which is attached to the vestibule door, the connecting rod K and cam L, which slides on the square shaft M. When the shaft M is tilted to place the sliding cam L in "off" position, the opening of the vestibule door causes the cam merely to slide on the shaft without any effect on the extensible portion of the trap. The shaft M is tilted by means of a small knob on the end of a vertical rod which is attached to a lever arm on the end of the square shaft, the knob being located in a recess at a convenient height in the vestibule wall. When the square shaft is thus tilted the sliding cam comes up in back of bracket E, on the trap, so that when the door is opened the sliding part of the trap is extended. The sliding cam is designed so that whether in "on" or "off" position, the front finger of the cam is always in position to hold the extensible part of the trap, so that it is absolutely impossible for the trap to be out with the door closed. Also, the trap is arranged so that it cannot be raised when extended, thereby preventing the obstruction of the handrail at the side of the car.

The trap is designed with a uniform extension to take care of the gap at platforms built on as sharp a curve as 6 deg. On lighter curves the extension may overlap the platform an inch or two, the station platform, of course, being kept at the height of a small step below the floor of the car.

Indicator Board for Disconnecting Switches

At the Manchester Street generating station of the Rhode Island Company, in Providence, R. I., a convenient indicator board is utilized to show incoming operators the positions of disconnecting switches between the various generators, rotaries, transformer units, etc., and the main and auxiliary buses. The board consists of a panel about 3 ft. long and 10 in. wide, carrying about thirty-six wooden strips indicating whether a particular knife switch is in or out of circuit. The strips can be slid in and out with ease, and whenever a disconnecter is opened or closed, a notation is made to correspond on the board. In this way any operator coming on duty knows at a glance just what switches are open or closed, and does not have to rely upon another's memory or upon loose paper memoranda. The remote-controlled oil switches in the station are equipped with the usual pilot lights, but when disconnectors of the knife type are opened or closed no electrical indication is feasible, and the maintenance of such a bulletin board is a decided convenience. In this station all the disconnecting knife switches are equipped with locking devices which prevent their being blown open by magnetic reactions in case of a short-circuit or severe overload on any given feeder. The switches are mounted in concrete cells provided with wired-glass covers, so that inspection is greatly facilitated.

INDICATOR BOARD

The Interborough Rapid Transit Company proposes to install at the Fourteenth Street subway station platform for southbound express trains five additional space-filling devices, similar to the one already in service. The device is a movable platform edge which automatically fills the gap between the trains and the curved platform, and has been described and illustrated in the *ELECTRIC RAILWAY JOURNAL*.

News of Electric Railways

CHICAGO ARBITRATION AWARD

Summary of Award to the Surface Men Made by the Arbitrators on July 16

Mayor Thompson and State's Attorney Hoyne informally announced the arbitration award to the men on the Chicago Surface Lines on July 16, granting an increase in the minimum wage from 23 to 25 cents for the first year of the contract and 26 cents for the second year. The maximum wage is increased from 32 cents in the sixth year to 35 cents in the fourth year. This scale is to be increased to a 36-cent maximum in the second year of the contract. The award to men outside of the train service is not announced. The railway reiterates its intention to abide by the decision of the arbitrators. Mr. Sheean, representing the company on the board, will submit a minority report. The Chicago Elevated Railways not being bound to accept the award intends to conduct another arbitration.

Final arguments by both sides were made on July 9. To preserve the principle of arbitration both the railway companies and the men agreed to shorten the period required to submit evidence and the arbitrators agreed to render their decision promptly.

Dissatisfied with the manner in which the men presented their case, all the witnesses having been officials or committeemen of the union, the Mayor requested the railways to furnish him with the names and addresses of all employees. In round figures this list included 10,000 names and addresses, and from these the Mayor invited 360 to call at his office and discuss the need of increased wages and better working conditions.

On July 7 Mr. Weatherwax was cross-examined regarding the various positions he had held with the company. Mr. Weatherwax stated that he began service as a boy at day wages, and now received \$10,000 a year as superintendent of transportation. He was also questioned regarding the wages of receivers at the car stations, and an effort was made to show that those who were taken into the union received more than those who were outside. In the dispatching system practically all switchboard operators were old trainmen. The question of vacations to clerical help and not to trainmen was also raised.

Several division superintendents' testimony was to the effect that working conditions had greatly improved and that five minutes was sufficient time for the conductors to turn in.

Thomas Blakely, superintendent of supply cars, explained the duties of the motormen working for him. He said that they rarely assisted in loading or unloading a car; they ran slowly, and were not required to stop as often as passenger cars, therefore could hold their place on a line without speeding. These motormen also had regular hours and were not required to wear uniforms. They were not on the street during rush hours, and were seldom asked to run their cars into the downtown district.

Edward W. Anger, general carhouse foreman, explained the duties of the various grades of repairmen. He stated that no particular skill was required in making running repairs. All heavy repairs were made at the shops. Most of the carhouse repairmen were ordinary laborers without previous training. Temporary promotion created bad feeling when the men were returned to their former positions. He said that to give up the right to use judgment in the promotion of men would interfere with good results. Promotion based on efficiency did not open the door to favoritism. Regarding the three grades of pay that carhouse repairmen receive, Mr. Anger stated that the men acquired skill with experience, and should be paid for it.

President Busby again took the stand on the evening of July 7, to introduce and explain a number of exhibits. These included tabulations of passenger-car miles and hours, etc. Another exhibit showed the relative cost of living in Chicago as compared with other cities. In this Chicago was taken as a basis, with 100 per cent. St. Louis was given 100.13 per cent, Detroit 100.20 per cent, Cleveland 105.59 per cent, New York 117.32 per cent, Pittsburgh 117.92 per cent, Philadelphia 119.46 per cent, Bos-

ton 127.86 per cent. Mr. Busby stated that these figures were compiled from an analysis of Bulletin 156, United States Department of Labor. He also introduced an exhibit showing \$45,713 a year as the cost of additional time under the new agreement for fall-backs and dinner reliefs. If five minutes additional turn-in time was given, the cost to the company would be about \$65,000 a year. Concerning the 37,143 accidents referred to earlier in the hearings, Mr. Busby stated that these included only 8400 liability cases, 600 of which went to suit. He also accounted for the fatal injuries to twenty-two employees mentioned in Mr. Mahon's testimony. He said that an examination of the records showed that some of these men were not on duty, others were injured through their own carelessness, and the remainder through negligence of fellow employees. He also introduced an exhibit to show that the number of accidents attributable to trainmen according to years of service was on a constant decline.

Mr. Busby next offered testimony regarding the finances of the company. He said that brokerage profits of all companies in eight years past were \$3,679,000, whereas the discounts were \$4,839,000, an excess of \$1,160,000. The 10 per cent construction totaled \$7,358,000, and after deducting the excess, a net of \$6,198,000 was left. He explained that 6 per cent of this amount went to the railways company and was applied against excessive indebtedness over purchase price and 40 per cent to the City Railway for disbursement as profits. He also stated that the average return to the companies on the purchase price of all roads for the past seven years was 6.52 per cent. Mr. Busby quoted from the daily reports of receipts since Feb. 1, 1915, and showed that the income so far this year was about \$460,000 behind a like period in 1913.

In recross-examination of Mr. Busby, the preparations made for resuming service in the recent strike were outlined. Mr. Busby said that thousands of experienced men were ready to go to work, and that 25,000 such men had been offered to him within forty-eight hours after the strike was declared. He said that he had arranged for a sufficient number to resume operation and was ready to board and lodge them. He did not care to state what he expected to pay them.

At a short morning session on July 8, the representatives of the employees announced that they would not put any rebuttal witnesses on the stand, but had arranged to argue their case at once. After a short session the hearings adjourned until July 9, when final arguments by Counsel Miller for the companies, and Counsels LeBosky and Alschuler for the employees were presented. Immediately following these the arbiters began to review the evidence.

SEATTLE-RENTON PURCHASE BY CITY ABANDONED

The City Council of Seattle, Wash., has decided to abandon plans to take over the Seattle, Renton & Southern Railway by condemnation proceedings within city limits, and to repeal an ordinance passed in October, 1911, providing for the prosecution of the condemnation suit. The condemnation case is now in the United States Supreme Court, and Assistant Corporation Counsel Ralph S. Pierce will move its dismissal. Both the Superior Court and State Supreme Court held that the city of Seattle had the right to condemn the railway, but an appeal was taken by Scott Calhoun and Joseph Parkin, receivers of the company. It is proposed now to turn attention to the improvement of Rainier Avenue in order to dispose of all other litigation prior to the calling to trial in the United States District Court of the suit of the Seattle, Renton & Southern Railway and its receivers against the city, seeking an order from the court to restrain the city from changing or in any way interfering with the present grades of Rainier Avenue. In an opinion handed down some time ago the Federal Court ruled that the Seattle, Renton & Southern Railway had a legal right to its franchise, which the Council holds has been revoked. Councilman Dale, who has been active in carrying on negotiations for the acquisition of the line by the city, said recently: "I believe that since the voters have authorized a bond issue to purchase, parallel or condemn

a railway in Rainier Valley, the Council should keep faith with the voters and carry out the intent of the proposition authorizing the issuance of bonds."

The Council recently defeated a bill to purchase the railway on the terms offered by the receivers.

CLEVELAND TERMINAL AND SUBURBAN FRANCHISES GRANTED

The City Council at Cleveland, Ohio, took favorable action on the evening of July 12 on the franchises asked by the Cleveland, Akron & Canton Terminal Railroad and the Cleveland & Youngstown Railroad.

Under the franchise of the Cleveland, Akron & Canton Terminal Railroad the company is empowered to build an electrically operated, four-track subway under East Fifty-fifth Street from the lake to the southern city limits. The company is headed by Ohio C. Barber, Barberton, Ohio, well known throughout the country as the match king. The vote was twenty to five. As has been stated before, the franchise covers a period of seventy-five years. The minority members demanded a statement as to what interests were back of this proposition and demanded a bond guaranteeing that work would be begun on it within two years. Mr. Barber insisted, however, that his plans were all for the benefit of the city and if the people did not want the improvement he would abandon it before he would be tied down with conditions and requirements which he considered useless. Mayor Newton D. Baker supported Mr. Barber.

Under the franchise of the Cleveland & Youngstown Railroad, passed by a vote of nineteen to six, the company is empowered to establish a freight terminal near Broadway, S. E., about forty streets being vacated for the purpose. An amendment requiring that the terminal be operated by electricity was defeated, as were twelve other amendments proposed by the opponents of the measure. Councilman Bernstein insisted that action on the franchise be delayed until an agreement had been secured from the other railroads that they would build a new union station on the lake front. He also alleged that the New York Central Railroad was behind the company, although the attorneys for the New York Central had stated at the committee meetings that this was not so. The company was organized to build a rapid transit road for the entrance of both steam and electric railways to a point near the retail business district and to furnish service to a district on the hills southeast of Cleveland which is rapidly developing as a high-class residence section.

KANSAS CITY-CLAY COUNTY \$1,500,000 VERDICT TO BE APPEALED

By gradual elimination the suits against the Kansas City, Clay County & St. Joseph Railway, operating between Kansas City and St. Joseph, Mo., and between Kansas City and Excelsior Springs, Mo., have been narrowed to one, that brought by the Interstate Railway for \$2,000,000, in which a verdict for the plaintiff for \$1,500,000 was awarded in the Jackson County Circuit Court on July 1, as noted in the *ELECTRIC RAILWAY JOURNAL* of July 10, page 78. Motion for a new trial in this case will be heard on Aug. 2. If the motion is denied, an appeal will be taken.

In the district north of Kansas City many different sets of options for the construction of interurban railways were secured at different times during the last twelve years. Most of the options were allowed to die, or were automatically extinguished by the failure of the companies to do the work required by law to the extent of 10 per cent of the capital stock in two years and completion of the road in ten years. It is alleged that only the Kansas City, Clay County & St. Joseph Railway had ever paid for rights-of-way, so that the present operating interurban is said by its owners to have the only effective rights to any options on its right-of-way.

Among projected interurbans in the district was the Kansas City-St. Joseph Electric Railway. This company secured options between St. Joseph and Kansas City, Mo., and did a small amount of work on the right-of-way above Dearborn. The line was to extend southward from St. Joseph to Kansas City. Another projected line was north-

bound from Kansas City to the north Missouri line, and some work was done on that right-of-way by the Interstate company. One of the earlier suits involving the right-of-way was brought by the Interstate company four years ago against the Missouri River & Camden Railway. This suit was dismissed without coming to trial. After the Kansas City, Clay County & St. Joseph Railway had begun operating, suit for \$200,000 damages was brought against it by the Kansas City-St. Joseph Electric Railway on the charge that the defendant had taken possession and was using land on which it had active options. This suit involved the right-of-way southward from St. Joseph about half-way to Kansas City. Later the Interstate company brought suit for \$2,000,000, making the same charge, this suit involving the right-of-way northward from Kansas City about half-way to St. Joseph. The Interstate case came to trial first. After the trial had begun, the suit of the Kansas City-St. Joseph Electric Railway was dismissed, and evidence was introduced in the Interstate case to show that the Kansas City-St. Joseph line had sold its rights to the Interstate company. This situation put the Interstate company in the position of having a presumptive series of options on the entire right-of-way of the Kansas City, Clay County & St. Joseph Railway between Kansas City and St. Joseph.

Ernest D. Martin, one of the plaintiffs and a promoter of the Interstate company, testified that he had renewed many of the original options with the consent of the property owners, while many of the property owners testified that they had never given their consent to such renewal.

The verdict for the flat sum of \$1,500,000 was signed by nine jurors. Two jurors favored a smaller sum, and one held out for a verdict for the defendant.

Receivers have been appointed for the Kansas City, Clay County & St. Joseph Railway, as referred to elsewhere in this issue.

EMPLOYEES RAP ARBITRATION

Men Say Pleas of Company Impoverishment and Law of Supply and Demand Make Arbitration a Farce

At a meeting on July 7 of the joint conference board representing the sixteen divisions and 4200 employees of the Bay State Street Railway, Boston, Mass., it was decided that in future no arbitration proceedings would be agreed to by the men unless it was stipulated in advance that the factors of the company's financial condition and the "law of supply and demand" would be eliminated from all consideration in the proceedings. The following is the text of the resolution adopted:

"In the future no arbitration shall be held unless it is a fair arbitration. The Bay State Street Railway enjoys its franchise and the right to make money from the public, and except for the public it would not exist. The company is constantly reminding us of what we ourselves well know about the interest of the public in the operation of its cars. We realize that a failure to arbitrate and a strike might result in great inconvenience to hundreds of thousands of people, and a strike is not lightly undertaken. There never has been a strike on this system.

"The public should be reminded, however, that the company takes advantage of our recognition of the public interest by using against us in arbitration the law of supply and demand, and its financial condition. By agreeing to arbitrate we lose the only weapon we have to meet both these arguments, and unless they are both eliminated in the future we think arbitration, so far as we are concerned, will be a farce.

"After many years of hard work and the presentation of our claims concerning both these factors, many boards of arbitration have recognized the force of the argument that the law of supply and demand could only be invoked against us if we were given a fair chance to try it out, and as Chairman Storow of the Boston Elevated Railway board of arbitration said, the only way in which it could be really tested would be to have a strike and see whether or not the company could at once secure the necessary number of competent men to prepare and operate its cars.

"If a street railway or other public service corporation was in the hands of a receiver because of its inability to pay interest on its bonds and people still wanted to ride,

no one would say that the wages of the men should be inadequate because of the financial condition of the company. We again call the attention of the public to the award of Chairman Storrow of the Elevated board of arbitration concerning finances, in which he agreed that the contention of the men should prevail and that the financial condition of the company should not be taken into account in fixing wages. The expense of a thorough financial investigation and the disadvantage at which we are placed in making such an inquiry are altogether too great to warrant us in again including it as a subject matter of consideration by a future board of arbitration."

ALBANY DIFFERENCES STILL UNSETTLED

On July 15 the question of jurisdiction between the unions on the lines of the Hudson Valley Railway and the United Traction Company, Albany, N. Y., remained unsettled. C. F. Hewitt, general manager United Traction Company, still insists that the conferences be open and that the newspaper men be permitted to attend them. He says that W. D. Mahon, president of the Amalgamated Association, who arrived in Albany on July 14, assured him at a conference in Detroit in May, at which Warren S. Stone, representing the steam brotherhood, was present, that the dispute between the Amalgamated and the Brotherhood as to who would operate the lines would be held in abeyance until the September convention of the Amalgamated association.

The men issued a statement in which they said their committees were explaining the situation to Mr. Mahon. They said that there are involved the working agreements of four divisions on the properties of the Hudson Valley Railway and the United Traction Company and grievances and complaints affecting the New York State Railways. President Horace E. Andrews of the New York State Railways is said to have expressed his willingness to take up at once the complaints affecting that company.

REFUSAL TO REOPEN BOSTON ARBITRATION

Classification Under Boston Elevated Award Must Stand Until May 1, 1916

James J. Storrow and his associates on the board of arbitration that settled the wage dispute between the Boston Elevated Railway and its union employees in 1913, have refused, in a decision handed down on July 8, to reopen questions in the original award over which a misunderstanding has come between the road and its men. The board was appealed to last December to interpret its rulings on classifications in the "L" shops. A difference of opinion had arisen as to whether or not men in a lower-paid class are entitled to the same rate of pay of a higher-paid class if they are doing the same character of work as men in the higher-paid class. In its conclusion the board, consisting of James J. Storrow, James L. Richards, representing the company, and James H. Vahey, representing the men, said:

"Whether the company intends to hold a deserving man back or not, this system, in our judgment, has this effect. We think that no large corporation can be gifted with the stock of wisdom needed to administer with justice such a highly complex system. There should be a reasonable number of gradations, but we find in general that the present number is excessive. We have therefore sought in fixing the new scale of wages substantially to reduce these classifications, as appears in the schedules which have been annexed.

"For example, we have reduced the classification of blacksmiths from twelve to six. But this has an important effect upon wages. The only way these excessive classifications can be reduced is to give some men more increase than others so as to level up the differences. If we gave every blacksmith 6 per cent increase in pay, there would still be the same twelve classes of blacksmiths."

"If the union is now free to raise this question again by a further examination of the character of the work being performed by the men under the present classification, it can only be for the purpose, at least in effect, of further reducing the number of these classes, or at least accomplishing a substantial portion of this result by taking a

substantial proportion of the men out of one class and putting them into a higher class than that determined for them by the board of arbitration.

"Our conclusion is that this whole question of classification was raised in the arbitration proceedings and definitely determined in the award resulting from these proceedings, and that the question cannot properly or fairly be reopened before the expiration of the period for which the original award was made effective, namely, not prior to May 1, 1916."

Mr. Vahey, who concurred with the decision of his colleagues, issued a statement setting forth his exact position in the controversy and lauded Mr. Storrow, asserting that the chairman was in no way to blame for the conditions which exist.

PROGRESS WITH TOLEDO TENTATIVE FRANCHISE

At a meeting of the franchise committee of the City Council of Toledo, Ohio, on July 9, Henry L. Doherty, chairman of the board of directors of the Toledo Railways & Light Company, expressed the belief that a clause should be inserted in the tentative draft of the franchise now in preparation that will allow the company to name its own rate of fare pending the fixing of a permanent rate at the end of the proposed try-out period, if the earnings should fall below 4 per cent. Councilman Dotson suggested that if a rate is not agreed upon within ninety days from the close of the period the matter should be submitted to a board of arbitrators or the courts. Mr. Doherty said that if the city insisted upon control of the operating rate, it should be responsible for any possible losses as the result of the establishment of a rate too low. The present draft provides that when the return on the investment falls to 4 per cent there is to be a readjustment of fares under the terms of the agreement.

The probable rerouting of cars and abandonment of any lines found to be unprofitable were also discussed at this conference. In regard to appraising the property, Mr. Doherty said that if three impartial men were selected an agreement could be reached with them without submitting the matter to a board of arbitration. The property should be valued as it now stands, with any betterments which are made added to this.

Mr. Doherty submitted an amendment to the clause relating to the municipal bond ordinance initiated and passed last August. Mr. Dotson insisted that nothing be placed in the draft to indicate that it supersedes the municipal ordinance. He also argued that all franchise values should be excluded from consideration in making an appraisal of the property.

Mr. Doherty objected to the transfer provisions of the draft, especially the portion relating to transfers on transfers. He said that he believed the people of Toledo wanted good service and good cars rather than low fare. The idea, then, would be to simplify the system so far as possible.

Frank R. Coates, president of the Toledo Railways & Light Company, and Rathbun Fuller, attorney for the company, were present at the conference, but there were few people in the lobby.

At a conference on the afternoon of July 14 between Henry M. Doherty and Messrs. Redd and Dotson of the special franchise committee of the Council, Mr. Doherty announced that if the committee insisted upon the company purchasing 20 per cent of the municipal railway bonds, in case the city should at any time conclude to purchase the property, there would be no need of negotiating further. Only a cash transaction can be considered. He also informed the members that the company was entitled to a full attendance of the members of the committee when the proposed franchise is discussed.

The provision of the franchise relating to the bonds is that they shall be taken at par and accrued interest. It is said by some that a better price should be secured for the bonds.

A tentative agreement was reached to the effect that the section of the draft which provided that "the city of Toledo by adopting this ordinance shall not waive any of its rights which it may have by virtue of the ordinance adopted on Aug. 4, 1914," be eliminated. This is the municipal ownership bond ordinance.

DIRECTORS APPROVE DETROIT SALE

At a meeting of the directors of the Detroit United Railway, Wednesday, July 14, the proposed purchase agreement covering the company's property within the one-fare zone was approved. This agreement provides that the city, if authorized by a 60 per cent vote of the electorate, shall assume operation of the city lines, the price to be fixed by the Circuit Court of Wayne County. The directors decided to submit the new proposition to the stockholders, and an adjourned meeting of the latter has been called for Aug. 2.

On July 14 J. C. Hutchins, president of the Detroit United Railway, sent a letter to the stockholders reviewing the purchase proposals. This he concluded as follows:

"After several weeks of negotiation, the following plan was approved, viz.:

"The city personally to assume the payment of outstanding mortgages up to the claimed limit of its power under the constitution and laws of the State of Michigan, viz.: 2 per cent of the assessed value of the taxable property within the city, which would amount to approximately \$11,000,000, and the balance, up to the limit of the price that would be fixed by the Circuit Court, by the creation of a sinking fund out of the earnings of the property to be taken over by the city, and so arranged that with the amount personally assumed by the city, the mortgage indebtedness referred to, up to the limit of the price fixed by the court, shall be paid in 1932, when the company's consolidated mortgage indebtedness matures, and any excess in price above the amount of outstanding mortgage indebtedness is to be secured in the same way and be payable at the same time.

"The proposed contract, modified as to the method of fixing the price to be paid for the property and the method of securing the payment of this price, you will recognize is materially different from the proposal originally made and upon which many of the stockholders sent their proxies, and while these proxies by their terms are unlimited and would authorize their use in voting upon the final proposition now to be acted upon, the holders are unwilling to use such proxies until all the stockholders, and especially those who gave such proxies, are advised as to the contract that is to be finally acted upon.

"The proposed modified contract has been fully considered in all its aspects by our board of directors in connection with existing conditions, and it has approved of such contract and unhesitatingly recommends to the stockholders the approval of the same.

"An adjourned meeting of the stockholders will be held at the company's office in Detroit on Aug. 2, at 3.30 p. m. for the purpose of considering such modified contract, and unless in the meantime advised to the contrary by the stockholders who gave the proxies referred to, the holders will feel, after this notice, warranted in voting the stock covered by such proxies in approving such modified contract and authorizing the board of directors and officers of the company to take such further steps in the direction of having the same carried into effect as may be necessary or proper.

"The contract cannot become binding on the city until approved by 60 per cent of the voters of the city voting upon the proposition at an election to be called for that purpose."

STRIKE DECLARED IN RHODE ISLAND

A strike of the union employees at the Rhode Island Company, Providence, R. I., was declared at midnight on July 14. Questions at issue between the company and its men had been the subject of negotiations for some time past, and all of the requests of the men had either been waived, settled or agreed upon except the question of wages. This the committee representing the union had agreed to submit to arbitration. The break came over the arbitrary stand taken by the representatives of the men with respect to the method of choosing arbitrators to consider this question.

Some time ago the company suggested to the men that the old schedule of wages be restored. The committee representing the union suggested that the old agreement, which expired on June 1, 1915, be continued for a period of two years with an additional clause providing that the company should discharge from its service or suspend employees who were members of the association until all sums due to the association had been paid. This was agreed to by both

sides, with the understanding that the wage question should be decided by arbitration.

The men in the service of the Rhode Island Company now receive 28½ cents an hour after three years' service. They asked for 35 cents an hour as a maximum scale. The wage for the first six months is 23 cents an hour. The men asked 30 cents for the first six months. They also desired to eliminate the present system of graded rates. They maintained that a man is efficient after the first year's service and that he should receive the maximum wage at the end of the first year.

Curtailed service was established by the company on all the main city lines on July 15, but it was announced that the service would be suspended after 7 o'clock. A few minor disturbances were reported on the first day. More than 2400 men are said to be affected by the strike order, which also extends to the employees of the power houses.

Completion of Electrification Celebrated.—The first electric train over the London & Port Stanley Railway, London, Ont., which has just been electrified, started from St. Thomas at 6.30 p. m. on June 30 to Port Stanley, carrying a number of guests from London and St. Thomas, invited by Sir Adam Beck to celebrate the opening of the road.

Northern White Cedar Association Outing.—On June 25 the Northern White Cedar Association began its annual mid-summer outing, the members departing in a special car via the Northern Pacific Railway from Minneapolis, Minn., for Beaudette, Minn. From Beaudette the party was conveyed by a fleet of six launches to a camp on Sabaskong Bay, Lake of the Woods, approximately 60 miles north. The party remained there for four days, making a number of exploration and inspection trips to points of interest.

No Decision in Old Dominion Case.—The judgment in favor of the Westinghouse Electric & Manufacturing Company against the Washington & Old Dominion Railway obtained in the Circuit Court of Loudon County, Va., was not set aside by the Supreme Court of Virginia as stated in the issue of the ELECTRIC RAILWAY JOURNAL of June 19. The action taken was simply the routine procedure of issuing a writ of error to review the decision of the lower court. The case was appealed by the railway company and will be heard by the Supreme Court of Appeals next fall.

New York Compensation Law Constitutional.—On July 13 the Court of Appeals of New York upheld the constitutionality of the workmen's compensation law on three questions raised in suits brought to make the test. Judge Nathan Miller wrote the opinion in the cases of Marie Jensen against the Southern Pacific Company, a Kentucky corporation, and of William Alfred Walker against the Clyde Steamship Company. In the Jensen case, which was for causing death, it was asserted by the company that the statute was not intended to apply to employment in interstate or foreign commerce. The awards were affirmed.

Fifty-Mile Canadian Line to Be Electrified.—Martin N. Todd, general manager of the Lake Erie & Northern Railway, Brantford, Ont., and president of the Galt, Preston & Hespeler Railway, has confirmed the report that the Lake Erie & Northern Railway is to be electrified for the whole fifty-two miles from Galt to Port Dover. Mr. Todd expects cars to be running on the Galt-Brantford line by October, and to Port Dover by November. It is likely that Hydroelectric power will be used with substations at Galt, Brantford and Simcoe. It is stated that the two lines will shortly be amalgamated, with through electric railway service ultimately from Berlin to Port Dover.

Bids for Rails, Ties, Ballast, and Track Accessories Wanted.—Bids for about 35,000 tons of open-hearth rails were opened on July 16 by the Public Service Commission for the First District of New York, and between that date and Aug. 4 bids will be received for about 3000 tons of rolled manganese rails, more than 1,000,000 tie plates, about 356,000 cu. yd. of broken stone ballast, and about 30,000,000 ft. of ties and timber. This material will be sufficient to equip about 230 miles of single track. The city-owned lines in the dual system cover about 260 miles of single track, but the track materials for about 30 miles in the Fourth Avenue subway in Brooklyn and the Centre Street loop subway in Manhattan have been purchased.

Action on Norfolk Franchise.—The joint committee of ten and the representatives of the Virginia Railway & Power Company have agreed upon the three franchises which will be submitted to the City Council of Norfolk, Va., for approval and passage. Three ordinances will be framed and submitted to the Council, perhaps during August. The provisions of the grants include six tickets for a quarter, to be sold in thirty places and on the cars after three years; universal transfers; school tickets with an age limit of twenty-one years; taxes at the rate of 1½ per cent on the gross earnings for three years and 2 per cent thereafter; the substitution of six tickets for a quarter for labor tickets on the Bay Shore Line, and service from 6 a. m. to midnight, with owl service when the business justifies.

New Haven Recovery Suit Dismissed.—A suit of minority stockholders to recover \$102,000,000 from former and present directors of the New York, New Haven & Hartford Railroad, who were charged with responsibility for alleged improper expenditures of funds, was dismissed by the Supreme Court of Massachusetts on July 8. William G. Rockefeller, Lewis Cass Ledyard, James S. Elton and Charles S. Mellen were among the defendants. The decision, which was written by Chief Justice Pugg, said in part: "It is an implied condition of becoming a stockholder in a corporation that its general policy shall be determined by the holders of a majority of the stock and that disagreements as to its dominating policy and as to details of its management shall be settled by its stockholders, and recourse cannot be had to the courts to adjust differences of this sort. It is only from actual necessity, in order to prevent a failure of justice, that a suit in equity for the benefit of the corporation can be maintained by a stockholder."

Summer School of Scientific Management.—The Pennsylvania State College will conduct a summer school of scientific management during the two weeks beginning Aug. 9. This summer session is planned for the accommodation of works managers, superintendents, heads of cost, stores, purchasing, planning, and production departments, and members of such departments. The time is restricted to two weeks to meet the needs of employees whose vacation period is limited to that time. The mornings of the session will be devoted to lectures and discussions on industrial organization and scientific management under the leadership of Prof. Hugo Diemer, head of the department of industrial engineering at the Pennsylvania State College. The afternoons will be devoted to applied methods of scientific management under the direction of W. H. Tabor. The shops of the Pennsylvania State College have been especially provided with means for teaching and demonstrating applied methods of scientific management. The fee for the course is \$15.

Perpetual Franchise Issue Before New York Constitutional Convention.—Two votes have already been taken by the New York Constitutional Convention committee on legislative powers, of which William Barnes is chairman, on a proposal to erect a constitutional prohibition against perpetual franchises. Both times the proposal has been defeated. The votes were taken in connection with a proposal presented by Seth Low, New York, at the request of the Citizens' Union. Mr. Barnes has appointed a sub-committee to draft an amendment to meet the sentiment in his own committee. The proposal of Mr. Low would prohibit municipal authorities from granting franchises in perpetuity. It would provide for indeterminate franchises, but would permit municipal authorities to resume control of the franchise on terms to be defined in the original grant. On July 14 William M. Ivins urged that in the recapture of franchises by municipalities provision should be made for paying the retiring corporation a fair return on the money expended in operation and sufficient compensation to make up for the loss of the franchise.

PROGRAM OF ASSOCIATION MEETING

Colorado Electric Light, Power & Railway Association

The thirteenth annual meeting of the Colorado Electric Light, Power & Railway Association will be held at Glenwood Springs, Col., on Sept. 23, 24 and 25.

Financial and Corporate

ANNUAL REPORT

Tennessee Railway, Power & Light Company

The combined statement of operations of the Tennessee Railway, Power & Light Company, Memphis, Tenn., for the calendar year 1914 (all power sales to distributing and railway companies controlled and other inter-company transactions being eliminated), is as follows:

Gross earnings	\$3,762,387
Operating expenses and rentals.....	1,959,183
Net earnings	\$1,803,204
Taxes	311,806
Net earnings after taxes.....	\$1,491,398
Interest, etc.	1,094,420
Net income	\$396,978
Dividends paid on stocks of constituent companies not owned	109,048
Balance	*\$287,929

*Of this balance \$1,628 accrues to stock of constituent companies not owned.

The constituent companies had accumulated earnings from May 1, 1912, to Jan. 1, 1914, of \$210,610, which, added to the above balance for 1914, showed a total of \$498,539 from which dividends on the preferred stock of the Tennessee Railway, Light & Power Company were paid on March 1 and June 1, 1914, amounting to \$306,336, leaving a balance of \$192,203. The two principal causes for the unsatisfactory showing for the year 1914 were first, the depression in business which particularly affected industrial centers like Nashville and Chattanooga and resulted in economy in the use of electric light and power and street railway service. The European war increased this depression and its bad effect on financial and industrial conditions prevented the closing of several large power contracts. Second, the worst drought experienced in Tennessee since 1904 (the previous low record year), reduced the amount of hydro-electric power available for sale and forced the company to operate its steam plants to a much larger extent than ordinarily necessary, thereby greatly increasing operating expenses. This drought was broken in December. The prospects for 1915 indicate an improvement in every way. The large construction work has been completed, and very little will be required for capital expenditures during the year.

The 1914 operating figures for the controlled Nashville Railway & Light Company and the Chattanooga Railway & Light Company are shown below:

	Nashville Railway & Light Co.	Chattanooga Railway & Light Co.
Gross earnings	\$2,240,307	\$1,085,096
Operating expenses	1,159,523	616,966
Net earnings	\$1,080,784	\$468,130
Taxes	194,209	82,757
Net earnings after taxes.....	\$886,575	\$385,373
Interest	499,670	339,408
Surplus	\$386,905	\$45,965
Passengers carried	43,673,934	16,384,356
Kilowatt-hours sold	25,214,365	12,567,439

NO PRESENT DIVIDEND FOR THIRD AVENUE

The stockholders of the Third Avenue Railway, New York, are not to have a dividend on their shares before September at the earliest unless the directors of the company go over the heads of their special committee. The company's earnings for the year ended June 30 were made public on July 14, and at the same time it was announced that the special committee had decided to drop its inquiry into the question of whether a dividend was advisable, leaving it for a full board to take up at their meeting in the autumn, when the pamphlet report will be ready.

For the fiscal year just ended the company's gross operating revenues were \$10,885,768, an increase of \$27,552. The operating expenses decreased \$27,590, and taxes increased \$3,922. There was an increase of \$5,912 in non-operating income and interest charges, and the sinking

fund, etc., took \$13,083 less, so that the net income amounted to \$696,521, an increase of \$70,215.

During the year the company spent for improvements a total of \$1,009,931 not included in the income account. This was met by the net income for the year of \$696,521, by a decrease of \$62,416 in the balance of current cash, by \$172,738 borrowed from the depreciation account, by \$26,083 from the sale of obsolete property and by some other small adjustments.

The usual 2½ per cent semi-annual interest on the adjustment income bonds was voted at the meeting of the directors on July 14. It is payable on Oct. 1.

In a statement given out by President Whitridge, it was announced that the directors had decided to establish a system of pensions in connection with the employees' association.

REFEREE HOLDS COMPANY LIABLE

United Railways of St. Louis Liable for Claims Against Predecessor Company to Extent of \$10,139,681 for Unpaid Subscriptions on Latter's Stock

A report filed in Judge Taylor's division of the Circuit Court by Referee Charles W. Bates upon the creditors' bill of J. Brooks Johnson against the United Railways of St. Louis and other stockholders in the St. Louis Transit Company, holds that the defendants are liable for judgments held against the transit company by the plaintiff, also for interest at the rate of 6 per cent since the judgments were rendered and court costs.

The defendants are declared to be liable individually to the extent of the difference between what they paid for stock of the St. Louis Transit Company and its par value, in satisfying the judgments, which were purchased by Johnson from persons who had won personal injury suits against the St. Louis Transit Company. These judgments originally aggregated \$27,044, in addition to which the plaintiff seeks interest and court costs.

In setting forth the extent to which individual stockholders in the St. Louis Transit Company are liable, Referee Bates holds that only \$41 was paid to the St. Louis Transit Company for each share of its stock, par value \$100, thus leaving \$59 per share unpaid. There is said to remain unpaid on the 171,859 shares of stock of the St. Louis Transit Company held by the United Railways of St. Louis, \$10,139,681. In case the referee's report is approved by the lower court and upheld by the higher courts, the United Railways of St. Louis and other defendants would be obligated to pay only such claims as were found to be owing by the St. Louis Transit Company prior to its absorption by the United Railways. Attorneys for the United Railways have already filed a bill of exceptions.

COMPANY CLAIMS SURPLUS

United Railroads of San Francisco in Application for Rehearing Denies Allegations of Commission and Asserts Inability to Set Aside Improvement Funds

The United Railroads of San Francisco has filed an application with the California Railroad Commission for a rehearing of the case in which the commission ordered the company to set aside \$550,000 a year from income for improving its system and in which it also directed the company to make certain changes in its system of accounting. This decision was abstracted in the *ELECTRIC RAILWAY JOURNAL* of May 22.

The company questions the jurisdiction of the commission, especially in the announcement that instead of a surplus the company has a deficit in its profit and loss account. It says:

"We do not understand that your board has authority to marshal liabilities, determine legal or equitable priorities or appropriate assets, or to redraft or reframe the company's books of account so as to show a deficit when we earnestly and honestly believe, and have been so advised by counsel and accountants, that this company was within the law when it reduced its capital stock, compromised doubtful claims, reduced its liabilities in the amount of money actually paid into the sinking fund and set up in a surplus

account this money actually paid to the trustee, thus wiping out the deficit which your board has said exists."

The company goes on to say that it suffered a property loss in excess of \$1,200,000 in the fire and earthquake, that it reduced its capital stock by this amount and its property account by \$1,600,000, and charged the surplus with \$1,200,000. The surplus was then credited with the net amount in excess of \$400,000, and the result was that the capital stock and surplus were reduced \$1,600,000 and the property account was reduced in like amount, which transactions the company believes correct from a legal and accounting point of view.

The company states that it will need its revenue from all sources for the payment of its operating expenses, taxes, sinking funds and interest, and that it will not be able to set aside \$300,000 annually for three years, as ordered by the commission, as a special fund in bank to be used for extensions and additions. The company also declares that because of causes beyond its control which affect its revenues, it will not have the ability to set aside \$45,833 a month within fifteen days after the first of each month following July 15.

MAINE COMMISSION REPORT

The sixth annual report of the Board of Railroad Commissioners of Maine contains returns from the fourteen electric railways in that State. The total mileage of street railways in operation on June 30, 1914, was 494.27 miles, an increase for the year of 9.18 miles. The gross assets of the several companies on that date were \$33,661,037, while the gross liabilities and the capital stock totaled \$32,869,742. The total amount of dividends declared during the year was \$341,599, an increase of \$113,122. The average dividend rate was 2.71 per cent. The combined reports of earnings for the year showed the following figures: Gross income, \$3,744,069; operating expenses, \$1,956,124; taxes, interest and other charges, \$1,226,426; net income, \$561,519; reserves and special charges, \$123,815; dividends paid, \$341,599, and surplus, \$96,105. During the year eight persons were killed and eighty-four were injured.

NEBRASKA STATE RAILWAY COMMISSION

The seventh annual report of the Nebraska State Railway Commission for the year ended Nov. 30, 1914, contains the usual general review of the commission's activities during the year and the details of complaints, orders, decisions and reports made to and issued by the commission. The gross earnings from operation for all companies during the year amounted to \$3,764,667, and the total operating expenses to \$1,882,751, while the net income from operation was \$1,907,589. Interest paid totaled \$695,123; taxes, \$293,865; dividends, \$539,366; depreciation reserves, \$294,605, and additions and betterments, \$568,464. At the end of the year the surplus was \$91,158. The total number of fare passengers was 68,234,000 and the total number of revenue car-miles run was 13,016,501.

Barcelona Traction, Light & Power Company, Barcelona, Spain.—The holders of the first mortgage fifty-year 5 per cent bonds of the Barcelona Traction, Light & Power Company at a recent meeting in June approved the proposed readjustment plan described in the *ELECTRIC RAILWAY JOURNAL* of Feb. 27 and May 1. A preliminary consent by the London holders was noted in the issue of May 29. H. F. Parshall, formerly chairman Central London Underground Railway, will have charge of operation, and E. R. Peacock, formerly vice-president Dominion Securities Corporation, Ltd., of financial arrangements.

Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala.—The Cunningham independent bondholders committee of Boston in a recent circular stated that under an agreement dated June 14 between it and the New York committee of bondholders (C. H. Zender, chairman), the bonds deposited with the American Trust Company, Boston, have been redeposited with the Empire Trust Company, New York, depository for the New York committee. This makes a total of about \$2,500,000 of bonds deposited with the latter committee, which assumes the expenses incurred by the Cunningham committee in its investigation into the company's affairs. This action will not curtail the Cun-

ningham committee's desire for an accounting in case of a deficiency judgment in the foreclosure proceedings.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—On July 7 Justice Brown of the State Supreme Court appointed George Bullock receiver of the Buffalo & Lake Erie Traction Company in the foreclosure suit instituted by the New York Trust Company, mortgage trustee. C. K. Beekman, counsel for the bondholders' committee, stated that the appointment was necessary in order to finance certain betterments through the sale of receiver's certificates.

Columbus, Delaware & Marion Railway, Cincinnati, Ohio.—Judge Kinkead on July 3 refused to authorize the Columbus, Delaware & Marion Railway to issue \$150,000 of receiver's certificates to meet obligations falling due on Aug. 1. He authorized the receiver, however, to execute notes for one year or less to pay expenses amounting to \$55,000. The court instructed the receiver to pay interest on all bonds in order to enable the consolidated bondholders to take such steps within a reasonable time as they may wish to reorganize and lift the receivership.

Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo.—Judge Bird in the Jackson County Court on July 12 sustained the plea of the Interstate Railway for receivers for the Kansas City, Clay County & St. Joseph Railway and appointed Edward J. Corrigan and Bayliss Steele to act as such. The application was made to protect the judgment for \$1,500,000 damages recently rendered the Interstate Railway for the taking of right-of-way on which it held options. This judgment is practically arrested pending action on motion for a new trial on Aug. 2. A more detailed explanation of the situation involving these companies is published on page 119 of this issue. On July 14, after an agreement between counsel, Judge Bird rescinded his appointment of Messrs. Corrigan and Steele and named I. D. Hook and J. G. L. Harvey as receivers. Mr. Hook is son of United States District Judge William C. Hook. The agreement reached covers the continuation of the regular operating force of the company.

Michigan United Railways, Jackson, Mich.—New York interests connected with the Michigan United Railways and the Commonwealth Power, Railway & Light Company deny that there is any truth in the rumor that they are preparing to make a bid for the Père Marquette Railway when it is sold at foreclosure next autumn, for the purpose of electrifying it and adding it to their system.

San Francisco (Cal.) Municipal Railways.—In May, 1915, the cash receipts of the San Francisco Municipal Railways from all sources were \$185,707, which, less transfer deductions of \$2,392 and operating expenses of \$107,177, leaves a balance in favor of operation of \$75,138. In June receipts are reported to have been \$199,261. If the average for the first five days of July is maintained, the receipts for that month will amount to more than \$225,000.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—A recent circular issued by the San Francisco-Oakland Terminal Railways, explaining the default in the payment of interest coupons maturing during July, states that a committee of security holders has been organized for the purpose of studying the financial problems of the company, formulating plans for subserving the large values recognized by the California Railroad Commission and bringing about whatever readjustment may be necessary in order to put the finances of the company on a permanently sound basis. The committee has secured the co-operation of San Francisco and Oakland bankers, who have agreed to buy these interest coupons for the full face amount less the income tax. The Mercantile Trust Company, San Francisco, representing ten or twelve banks, has offered to purchase the coupons from the first consolidated thirty-year 5 per cent bonds, and also from all the other issues of the system accruing in July, provided the selling bondholders agree that the coupons shall be given prior rights under the several mortgages as against the principal of the bonds and any interest not yet matured.

Western New York & Pennsylvania Traction Company, Olean, N. Y.—W. R. Page, president Western New York & Pennsylvania Traction Company, and associates have taken an option on the line of the old Buffalo & Susquehanna Railway from Wellsville to Buffalo. If the option is exercised it will be done independently of the electric railway.

West Virginia Traction & Electric Company, Wheeling, W. Va.—On June 1 the West Virginia Traction & Electric Company issued and sold \$1,500,000 of two-year 6 per cent gold notes, as stated in the ELECTRIC RAILWAY JOURNAL of June 9. Of these notes \$1,250,000 has been used to purchase \$1,250,000 of 5 per cent three-year convertible gold notes due on July 1. On this latter date the mortgage and deed of trust dated July 1, 1912, covering the first refunding and extension mortgage thirty-year gold bonds, dated July 1, 1912, and due on July 1, 1942, was cancelled and in its place there was created a mortgage and deed of trust dated July 1, 1915, under which there is a total authorized issue of \$25,000,000 par value of first refunding and improvement mortgage thirty-year gold bonds dated July 1, 1915, and due on July 1, 1945. There has been issued and deposited as collateral for the \$1,500,000 of two-year 6 per cent gold notes before mentioned \$1,875,000 of these first refunding and improvement mortgage thirty-year gold bonds.

York (Pa.) Railways.—The directors of the York Railways have declared a dividend of 2½ per cent on the \$1,600,000 of 5 per cent cumulative preferred stock for the half year ended Nov. 30, 1914, payable in cash on July 30 to holders of record on July 20. The previous dividend was paid in 5 per cent scrip.

DIVIDENDS DECLARED

Charlottesville & Albemarle Railway, Charlottesville, Va., semi-annual, 3½ per cent, preferred.

Denver & Northwestern Railway, Denver, Col., quarterly, one-half of 1 per cent.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., quarterly, 1½ per cent, preferred.

New Hampshire Electric Railways, Haverhill, Mass., 2 per cent, preferred.

United Railways & Electric Company, Baltimore, Md., quarterly, 50 cents, common.

York (Pa.) Railways, \$1.25, preferred.

Traffic and Transportation

THE JITNEY BUS

California Supreme Court Upholds San Francisco Ordinance Ruling—Georgia Commission's Plan for Regulation

The San Francisco jitney bus ordinance has been declared valid by the Supreme Court of California. The matter was brought before the court by a writ of habeas corpus issued in behalf of Paul Cardinal, a jitney bus driver, arrested in May and charged with violating those provisions of the measure which require a bus driver to qualify in a bond or insurance in the sum of \$10,000 and also pay a license fee. The court dismissed the writ and remanded Cardinal into custody. In his writ Cardinal, through his attorney, attacked the ordinance on the ground that it was discriminatory in that it attempted to regulate by bond and other requirements an automobile driver who charged no more than 10 cents fare. The Supreme Court holds that the ordinance is a reasonable exercise of the police power vested in cities for the protection of citizens and that laws made by virtue of such power are not to be set aside by courts unless they are found to be unreasonable and unjust. The court sees no unjust discrimination in the not-more-than-10-cents-fare classification for the reason that such low fare puts the jitney driver in competition with the street car and tempts him to run at a high rate of speed to make his profit. It holds that the jitney business is one which, if negligently conducted, would be fraught with danger to passengers in the jitney buses and to persons in the public streets, and therefore particularly subject to special regulation.

The injunction sought by associated jitney-bus operators in Atlanta to restrain the Georgia Railroad Commission from proceeding further with its announced program of prescribing rules and regulations for the buses as common carriers was denied on July 10 by Judge W. D. Ellis of the Fulton Superior Court. No arguments were heard, the court having before it the petition of the jitney-bus operators and the answer of the Railroad Commission. The latter's position was that it had applied no rules, those which had been published being merely tentative and subject to discussion and permanent order at the hearing set for July 13 by the commission. The jitney-bus men indicated they would appeal to the Supreme Court from the decision of Judge Ellis, and the latter therefore granted a supersedeas allowing twenty days for such action to be taken. The commission's announced hearing, set originally for July 13, is stayed meanwhile. Some weeks ago Judge Ellis denied the jitney-bus men's petition to enjoin the city of Atlanta from enforcing its ordinance taxing them and regulating them under its police powers. This has been argued on appeal in the State Supreme Court.

Offering to establish auto-bus lines in East Bakersfield, Cal., and for Beale Park, A. G. Wishon, general manager of the San Joaquin Light & Power Company, appeared before the City Council of Bakersfield, Cal., urging that some action should be taken toward the elimination of jitney bus competition with the electric railway. He suggested that the jitney lines, as well as the auto-bus lines, to be placed in service by the street railroad, should be regulated, placed on certain routes and the public be given guarantees of service. In East Bakersfield he proposed that the street railroad bus lines should serve Baker and Niles Streets, making schedules so that connections would be made with the street cars. Transfers would be issued from the street cars to the auto-buses and vice versa, making a 5-cent fare over the entire route, the city's autos to run as late as the cars operated. In the Beale Park district it was proposed that the auto-bus service connect with every other car.

Andrew Linn Bostwick, librarian of the municipal reference branch of the St. Louis library, has devoted the July issue of the St. Louis Public Library *Monthly Bulletin* to the subject: "The Regulation of the Jitney Bus—A Discussion of City Ordinances." The publication is a welcome addition to the growing list of pamphlets which have as their major purpose the recording of the rise and regulation of the jitney.

The Mayor of Charleston, W. Va., has signed the ordinance passed by the Council of that city to regulate the jitney. The license fee is fixed at \$24 for each machine. The jitney is described in the ordinance as a vehicle which carries passengers for hire at less than 10 cents each. The bond is fixed at \$2,500 for each car.

Jitney buses will be declared common carriers and placed under State regulation if a bill introduced by the committee on corporations in the Wisconsin Senate becomes a law. The bill provides that jitney owners must file with the State Railroad Commission a schedule of their rates, service, and routes, and if they are approved by that body, and on the filing of a bond of \$5,000 for payment of damages for personal injuries to passengers, the jitney men shall be entitled to permits to operate, subject to the supervision of State regulating authorities.

In applying to court for an injunction to restrain the enforcement of the jitney ordinance enacted in Pottsville, Pa., the owners contended that compliance was impossible. The ordinance requires jitney owners to get a certificate of public convenience, but the Public Service Commission has notified them that it will not issue such certificates at present, as the statewide regulation of jitneys is a matter which will be taken up with great care. The ordinance imposes a tax of \$100 on each vehicle between Pottsville and Schuylkill Haven, which is claimed to be excessive. Decision was reserved.

The Board of Aldermen of Hartford, Conn., on July 19 will consider the jitney regulatory ordinance drawn up by the ordinance and police committee. The measure provides for the licensing of jitney operators by the chief of police at \$10 each for one year, revocable for failure to comply with the provisions of the ordinance. Not more than two passengers in excess of the seating capacity are to be carried. The routes must be conspicuously posted on the machines. The tentative draft does not contain any bond regulation.

The Bristol (Tenn.) Traction Company is planning to install several motor-buses to traverse the principal residence streets not on the lines of the company, gather up passengers and transfer them to the regular cars, at the usual fare.

By furnishing one bond covering thirty-two jitneys, a local jitney association at Louisville, Ky., has complied with the terms of the law and is preparing to put that number of cars in operation, it is stated.

Councilman T. H. Bolton of Seattle has prepared a jitney ordinance which would require a city license or permit for each jitney driver, compel jitney operators to follow certain routes during certain hours of the day and night, make it unlawful to charge a higher fare than that specified in the ordinance and designate points at which passengers may be loaded and unloaded.

Officials of the Tacoma Jitney Bus Association have sworn out warrants for the arrest of fifteen automobile drivers who carried passengers for charge to the race track during the recent automobile races held in that city on July 3, 4 and 5. The warrants charge the drivers with operating without licenses. The prosecuting attorney's office announced that warrants would be issued for approximately thirty Seattle drivers, who operated motor trucks to the Tacoma speedway on the dates named, without a State license to carry passengers. The State law fixes the maximum penalty of \$500 for each passenger carried in cases of such violations.

Motor-buses operating at a fare of 3½ cents have been introduced on North Monroe Street, Spokane, Wash., by the Green Security Company, which has five ten-passenger machines in service. J. W. Green, president of the company, promises a 2½-cent fare for North Monroe Street in the next few weeks, when two new forty-two-passenger cars and two thirty-one-passenger cars are delivered from St. Louis. Mr. Green is quoted as follows: "We began to issue books of 100 tickets for our first auto-buses at \$3.50, thus reducing the fares purchased in this lot to 3½ cents. For those who do not care to invest in 100-book ticket we have another special rate ticket of twenty-five for \$1. I wish to deny that the Green Security Company is being backed by the Washington Water Power Company, which operates the local electric railways."

COMMISSION SUBSERVIENT TO LEGISLATURE

New York Commission Lacks Power to Increase Rates
Beyond Legislative Maximum

Refusing to permit the Ulster & Delaware Railroad to increase its mileage book rate from 2 to 3 cents a mile the Public Service Commission for the Second District of New York City on July 7 made one of the most important statements of principle since the passage of the public service commissions law in 1907. The majority of the commission holds that notwithstanding the broad rate-making powers granted by the Hughes statute and its subsequent amendments, the commission has not the power to permit a rate to be increased above a maximum set by the Legislature. Chairman Van Santvoord in the prevailing opinion, concurred in by Commissioners Hodson and Irvine, points out that should the commission assume that the power to permit such increases had been delegated to it by the passage of the public service commission law, not only the mileage-book law involved in the present case but such other statutes as the 3-cent maximum fare law, possibly even the 80-cent gas law for New York City, and other similar enactment might be in effect repealed by the commission's decisions. In an extended review of all the statutory sections involved he fails to find that the commission, either expressly or impliedly, has been granted such power.

Commissioner Emmet and Commissioner Carr dissent. Mr. Emmet holds that had not the Legislature intended to take the rate-making power out of the "often bungling" hands of the Legislature and place it for expert determination absolutely in the jurisdiction of the commission the whole battle of Governor Hughes for the regulation of public utilities would have been vain. As the power to lower rates irrespective of legislative enactment is expressly granted in the public service commissions law, Mr. Emmet finds that the power to raise rates is implied beyond reasonable doubt. Were this power to raise rates to afford a reasonable return on investment in accordance with the facts disclosed in each case not implied, Mr. Emmet holds that the intent of Governor Hughes and the Legislature which passed the law would have been anything but the distribution of even-handed justice, to the railroads as well as to the public.

The Supreme Court of Missouri, as quoted in the opinion of Commissioner Carr, has held that the Public Utility Commission of that State, by a statute delegating to it the rate-making power in the same words as does the Hughes law, was empowered to set aside the 2-cent fare law of that State. He holds that the mileage-book law of New York State is in effect but a legislative guide for the railroads which come under it until the rate which it prescribes can be passed upon by the Public Service Commission.

The mileage-book law was passed in 1895 and the commission holds that it was not repealed when the public service commissions law was enacted in 1907. On the contrary, it is pointed out that when the consolidated laws were enacted in 1910 the public service commissions law was made chapter 48 of the consolidated laws and the mileage-book law in its then precise form was made chapter 49 of the consolidated laws, the chapter numbers at least indicating that the mileage-book law, re-enacted thus subsequently to the public service commissions law, specifically escaped the effect of the clause in the public service commissions law repealing all other statutes contrary to itself.

The mileage-book law provides that wherever a railroad more than 100 miles in length sells regular tickets for more than 2 cents a mile up to the legal maximum of 3 cents a mile it must sell a mileage book at 2 cents a mile. The Ulster & Delaware Railroad pleaded that this was not a rate on which it could earn a fair return within the law and asked for permission to increase the rate to 3 cents a mile under the general rate-making powers of the commission. It was opposed by the State Council of the United Commercial Travelers and by the municipal authorities and civic bodies along the lines of the road. While the majority opinion seems to concur with the dissenting one in that the railroad on a basis of fair return is entitled to an increase and admits that in such a case the commission has a power to grant an increase, it holds that this power to increase does not extend to increases above a statutory maximum.

The direct question as to whether the commission has the power to raise rates in contravention of these older statutes has never been raised in New York State before, and the decision of the commission will undoubtedly be carried to the court of last resort for final determination. Not only the Ulster & Delaware Railroad but every railroad company in the State whose lines are more than 100 miles long and which has been incorporated since the passage of the mileage-book law or which has since that date been formed by consolidation of previously organized corporations and sells regular tickets for more than 2 cents a mile is now limited to 2 cents a mile for its mileage rate.

THIRTEEN KILLED IN GORGE

Of Eighty-four Passengers on Derailed Car Not One
Escaped Injury

On the evening of July 8 a double-truck open car of the International Railway, Buffalo, N. Y., crowded with passengers, most of whom were women and children, skidded over the slippery rails in a heavy rain storm and dashed down the steep incline near the foot of the grade from Brock's monument overlooking the lower gorge of the Niagara to the boat landing at Queenstown, Ont., and after jumping the rails crashed into a tree and telegraph pole and partly overturned.

Of the eighty-four passengers on the car none escaped injury. Thirteen were killed and more than threescore were so badly injured that it is expected some will die. The accident was one of those unavoidable affairs caused partly by the weather and partly to the mad rush of the excursion party to board the car which was the first of four to leave the monument, thus greatly overcrowding the trolley despite the efforts of the crew who urged a number to take the three following cars down the steep incline through the lower end of the gorge. Every effort was made by the motorman to keep the overloaded car under control. Preliminary investigations by the Dominion government and by representatives of the railway company show that the brakes were securely set; that the power had been reversed and that every effort was made by the motorman to stop the trolley from skidding over the slippery rails caused by the rain storm.

The passengers were members of two Toronto, Ont., Sunday school excursion parties who had spent the day in the grove in the vicinity of the monument overlooking the great gorge of the Niagara. The boat on which they were to cross Lake Ontario from Queenstown was to leave at 7.15 o'clock in the evening. Four cars were sent to the monument from the Whirlpool carhouse and the first car left the monument for the return trip at 6.40 o'clock, twenty-five minutes before the boat was scheduled to clear. It had been raining and the entire party tried to board the first car for the boat. The car was of the large open type with fourteen cross-seats, with a seating capacity of five on each seat, and with a running board on the river side of the car. Every seat was taken and the passengers crowded into the available standing room between the seats, while some stood on the running board despite the efforts of the car crew to persuade them to wait for the other three cars which were to follow within a few minutes.

The car was started while passengers were still trying to climb aboard. It was kept under control from the monument down to the Lewiston Bridge spanning the river between Queenstown, Ont., and Lewiston, N. Y., and here it was brought to a stop to allow the conductor to throw a switch leading from the main line to a spur track running along the Canadian side of the river to the boat landing. The worst of the grade had been covered up to this point. After turning the switch the conductor collected the remainder of the fares and gave the motorman the signal to proceed.

From this point the car gained momentum, and despite the efforts of the motorman to check the speed the car skidded, entered the last curve, which is a right-angle turn, and jumping the rails, crashed into a tree, which knocked every support from under the roof on one side of the car, and then struck a pole and partly overturned.

As soon as the car left the rails the conductor jumped. He hurried to Queenstown about an eighth of a mile away

and summoned aid. The roof collapsed on the passengers. Of the thirteen who died many were killed outright. The others died while being removed to the hospitals at Niagara Falls, Ont., and Toronto, Ont.

Investigation showed that both trucks left the rails; that the brakes worked and held the wheels; that the sand box was half full of sand; that the controller was reversed; that the car skidded over the slippery rails at a great speed before it struck the sharp curve which sent it into the air and toppled it over into the ditch. The grade from the monument down to the point where the car stopped so as to allow the conductor to turn the switch is much greater than at the point where the accident occurred.

Officials say this is another bit of evidence that shows the value of controlled entrance and exit cars. The car crew was powerless to check the mad rush of the excursion party to board the car. It is pointed out that if the car had been of the new controlled-entrance type, only as many passengers as could be seated would have been allowed aboard. This would have prevented overcrowding and the car might have been kept under control.

This is the first accident of a serious nature on the gorge line in years. The line from Niagara Falls, Ont., to Queenstown along the Canadian river bank is owned by the International Railway, and while operated as a part of the Great Gorge Route Company is not owned by the latter, which operates and owns the line through the American Gorge. The accident was not on the gorge route, but on a spur track leading from the main line to a boat landing. The rails and ballast were found intact after the disaster.

WASHINGTON BUS REFUSED INCREASE IN FARES

The Metropolitan Coach Company, now in the hands of a receiver, applied recently to the Public Utilities Commission of the District of Columbia for permission to increase its rate of fare from the present rate of six tickets for 25 cents to a flat rate of 5 cents per ride, contending, among other things, that it was unable to continue to furnish service under the present rate of fare. An investigation was made and a formal hearing was held on May 20. At the hearing the representative of the Metropolitan Coach Company reiterated the request, and referred the commission to the annual reports of the company for information concerning its finances. No objection to the increase in fare was made at the hearing, nor has any written protest been received. The company owns no unincumbered real property, and such expenditures as it has made for garage and plant facilities have been made upon leased land. The company owns six coaches, the cost price of which was \$3,749 each, making a total cost price of \$22,494. There is a balance still due thereon of \$2,894. The commission estimated the fair value of the property of the company at \$11,000. In its opinion the commission said:

"Since the company, during a large part of the calendar year 1914, was operating over a longer route than at present, and was operating four large buses which have since been disposed of, the operating conditions of the company for 1913 approximate more nearly to the present conditions than do those for the year 1914, and therefore the report of the company for the year 1913 is selected for purposes of comparison. The net operating revenue for that year was \$1,080. Assuming that the revenue passengers will number the same as in 1913, the annual revenue will be increased by \$4,172 over that year by an increase of fare to 5 cents, and assuming that the operating expenses will remain the same as in 1913, the annual net operating revenue will be \$5,252.

"Assuming the life of the coaches to be six years, the company should be setting aside annually for depreciation \$3,750, and, assuming yearly taxes at 1½ per cent on a valuation of \$11,000, the company should provide \$165 annually for taxes. This total annual charge of \$3,915, with a net operating revenue of \$1,080 when operating under the conditions for the year 1913, would leave a deficit of \$2,834, but with a net operating revenue of \$5,252 when operating under the same conditions except for an increase of fare to 5 cents, it would leave a gross income less operating expenses and taxes of \$1,337. However, the service furnished by the company is unsatisfactory. There are not enough coaches to handle the traffic, the condition of the

present coaches is poor, and the schedules filed with the commission by the company are not being regularly maintained. These conditions have been repeatedly brought to the attention of the company. In view of these facts, the commission is of the opinion that while a 5-cent flat rate of fare would be just and reasonable if reasonably satisfactory service were furnished by the company, it is not justified under the present conditions."

The commission has denied the petition of the company to increase its rate of fare to a flat rate of 5 cents and has announced that it will give further consideration to a petition for an increase in fare after reasonably satisfactory service has been established by the company.

EFFECT OF LOW FARES AT VANCOUVER

As announced in the *ELECTRIC RAILWAY JOURNAL* for May 15, the British Columbia Electric Railway inaugurated on May 10 an eight-tickets-for-25-cents rate for non-transfer rides in Vancouver and Victoria. This reduction from the 5-cent fare, made primarily on account of jitney competition, resulted by the following month in an increase of 25 per cent in Vancouver passenger travel and 3 per cent in revenue. At the same time the revenue per car-mile has remained practically stationary. The principal travel area of Vancouver is a 3-mile zone around the center of the city.

On May 17 the company also inaugurated a reduction of interurban fares on its lines between Vancouver and Westminster by changing the round-trip rate from 50 cents to 35 cents. The routes vary in length from 12 miles to 17 miles, so that the fare is practically 1 cent per mile. The reduction in this case produced a large increase of through travel, the increase in passengers being 9 per cent and in revenue about 20 per cent. The increased travel in both cases has been at the expense of competing jitneys.

SAN FRANCISCO INJUNCTION INOPERATIVE

An injunction against the Municipal Railways, San Francisco, Cal., was issued on July 6, as reported in the *ELECTRIC RAILWAY JOURNAL* of July 10, page 76, to prevent the city from operating cars running direct to the exposition over the lower Market Street tracks. The city, however, secured a twenty-four-hour stay of the injunction, and later a further delay of two days and a reassignment of the case to another judge. This means that the cars will continue to handle the exposition traffic until there are further developments. Meantime city officials are trying to establish the right of the municipal lines to the business that will be lost if the injunction is served. Thomas A. Cashin, superintendent of the Municipal Railways, has estimated that the exposition traffic over the municipal lines will be cut 50 per cent if the direct cars from the ferry have to be taken off. On this basis the loss would be about \$150,000 per annum. On the strength of this estimate the bond of the United Railroads was fixed at \$110,000.

REGULATION OF JITNEY ASKED IN INDIANA

A petition and brief was filed on July 13 with the Public Service Commission of Indiana by the Terre Haute, Indianapolis & Eastern Traction Company, seeking to require that the operation of jitney buses in the State of Indiana shall be subject to the regulation of the Public Service Commission as in the case of other common carriers, and that the owners of such vehicles shall be compelled to obtain franchises to operate them as common carriers. While the petition of the company specifically refers to conditions in Terre Haute, Ind., where it operates the city lines as part of its system, and where the competition of the jitney buses has become quite a factor, the request is made that the order of the commission shall cover every city in the State.

The company, through its attorneys, sets forth that the owners of jitney buses have held themselves out to the public as common carriers, and with this understanding solicit business on the basis of transporting passengers from one place to another within the city for a 5-cent fare. The same points are also reached by the cars of the traction company. The company says that the owners of the jitney buses are obtaining without any regulation or license the business for which the company is compelled to maintain expensive lines of street railroad. The owners of

such automobiles operate only at times when profitable, and thus are not required to maintain service at a loss as is the traction company. They are thus depriving the company of legitimate revenue which is needed to pay the expenses of improving the right-of-way of the company. This expense in Terre Haute amounted to \$150,000 for the past two years, and taxes amounted to approximately \$30,000 per annum. The fact that jitney buses as common carriers do not provide a flagman to protect the automobiles at railroad crossings is mentioned in the petition.

The Public Service Commission has appointed July 22 as the date when a hearing will be held in the Senate chamber of the State capitol at Indianapolis on the matter of regulation of jitney buses by the commission.

INCREASE IN FARE ALLOWED

The increase in the interurban fares of the Idaho Traction Company beyond Randall on the southern division and Collister on the northern division has been allowed by the Public Utilities Commission of Idaho in a decision just handed down. The commission, however, has refused to permit an increase in the fares on the Hill Crest loop and Collister and Cole school lines, has refused to permit an increase in the price of commutation tickets, and has refused to allow an increase in the 1-cent a mile fare charged on school children's tickets.

The commission based its opinion and order on the book valuations of the company. The total valuation of the properties of the company is shown by the commission from the books to be \$2,640,285. This includes 85.54 miles of road, all terminals, stations, equipment, paving, etc.; also the Pierce Park and Natatorium properties. The total operating revenue, including \$7,940 net earnings from the Natatorium, amounted to \$366,984 for last year. The total operating expense amounted to \$267,370 and the net revenue to \$99,614. This does not provide any allowance for depreciation, which, the commission says, should be about \$30,000. The earnings of the company for the year, not counting depreciation, amounts to less than 4 per cent. By making the allowance for depreciation and calculating the earnings as permitted under the order, the net will be a little better than 4 per cent. The commission some time ago granted a reduction in the power rate to be charged the company by the Electric Investment Company. This will result in a saving of about \$14,000 additional.

Taking the present one-way rates within the 5, 10, 15, 20-cent, and other limits, the following increases are allowed: 25 cents one way, now 45 cents round trip; 30 cents one way, now 55 cents round trip; 40 cents, now 75 cents; 45 cents, now 85 cents; 50 cents, now 90 cents; 55 cents, now \$1; 60 cents, now \$1.05; 65 cents, now \$1.15; 70 cents, now \$1.35; 80 cents, now \$1.45; 85 cents, now \$1.50. The first figure named in each instance is the fare charged one way. The figure named in the second instance is the round-trip fare to be charged under the increase.

TENNESSEE JITNEY DECISION APPEALED

The city of Memphis has appealed from the decision of Judge A. B. Pittman of the Third Division of the Circuit Court in the jitney case, mentioned on page 41 of the issue of July 3. The case will probably be heard by the Supreme Court of Tennessee early next September. The case came before the Circuit Court through a writ of habeas corpus, charging unconstitutionality of the act on jitneys for the violation of which the relator, S. B. Ryals, was held in restraint of his liberty. Judge Pittman declared unconstitutional Sec. 3 of the act, which required a bond of not less than \$5,000 for every jitney car operated. He did not pass on Secs. 1 and 2 of the act, which declared the jitneys to be common carriers and made it illegal for them to operate until they had been licensed by the city authorities and which also empowered the city authorities to fix the terms and conditions upon which jitneys may operate.

Uniformity in Car Operation Desired.—The City Council at Cleveland, Ohio, has adopted resolutions providing for the appointment of a committee to investigate the manner and method of payment of fares on the city railway lines and the manner and method of entering and leaving the

cars. The idea of Council is to establish uniform methods in both particulars.

Car Capacity Order Rescinded.—The Health Department of New York has officially suspended the operation of its order limiting the number of passengers on the cars of the Third Avenue, the Flatbush-Seventh Avenue, the Smith Street, the Graham Avenue and the Gates Avenue lines of the Brooklyn Rapid Transit Company. The order of the board fixed the maximum carrying capacity of the cars at one and one-half times their seating capacity.

Cincinnati Service Crippled by Storm.—Street car and interurban railway service in Cincinnati, Ohio, and near-by towns in both Ohio and Kentucky was crippled for hours by the heavy wind and rain storm which passed over that section on the evening of July 7. No great damage was done to the properties of the Cincinnati Traction Company and the Cincinnati, Newport & Covington Street Railway, but the streets were strewn with debris from unroofed and wrecked houses and buildings, rendering it impossible for the cars to make their way safely over the lines until the tracks could be cleared. Interurban lines were tied up for a time for the same reason.

Efficiency Awards of \$23,269 in Washington.—Following a custom inaugurated by the Capital Traction Company, Washington, D. C., seven years ago, \$23,269.50 was distributed recently among 196 motormen and 160 conductors who, for the year ended June 30, have lived up to the regulations of the company and had records for efficiency that entitled them to share in the benefits of the generosity of the company. Sixty motormen and twenty-five conductors, who have served the company ten years or longer, were each presented with \$100. Fifty-five motormen and thirty-three conductors, five years in the employ of the company, received \$75 each. Fifty-three motormen and sixty-five conductors, who came in the two-year class, received \$50 each, and twenty-eight motormen and thirty-seven conductors, who have been on the merit roll for a year, were awarded sums varying from \$27.08 to \$47.88. Since the merit system was started by the Capital Traction Company, in 1909, \$139,610 has been distributed among the conductors and motormen as an award for faithful and efficient service.

Free Transportation in Manila.—The question as to whether members of the city police force of Manila, P. I., are entitled to free transportation on the lines of the street railway has been the cause of a recent controversy between the Manila Electric Railroad & Light Company and the city of Manila, according to a newspaper dispatch dated June 5. It appears that the company insists on the collection from the city of \$1,150 alleged to be due as the result of the illegal enjoyment by policemen of free rides on the company's cars between Sept. 15, 1914, and April 15, 1915. A decision of the Supreme Court is said to have made compulsory the conspicuous display by policemen of their badges of office in order to be entitled to free transportation on the cars. The company contends that this ruling was not complied with during the period named and that in consequence it lost in uncollected fares the amount demanded from the city. On the other hand the city is suing the company for \$21,000 for fares paid by police officers the last eight years, during which period it is claimed they were entitled to free transportation.

Union Men Sign Lexington Participation Plan.—Several concessions made by the Kentucky Traction & Terminal Company, Lexington, Ky., to its union trainmen have resulted in their signing virtually the same three-year contract as that already signed by the non-union trainmen individually. The union's demand for a closed shop was rejected absolutely by the company, and the open shop principle, now in force, will be continued. The union men, however, may wear their union buttons, a privilege denied under the former contract, and may maintain a bulletin board at headquarters. The shopmen receive a flat increase of 1 cent an hour. Wages of the trainmen, union and non-union, will be governed by the condition of the contract heretofore described in the *ELECTRIC RAILWAY JOURNAL*, by which the company sets aside a fixed percentage of its earnings to pay damage claims, the residue to be divided among the men as an increase, in addition to a 1-cent general increase effective on July 15 with the new contract. The company has agreed to provide the men with seats.

Personal Mention

Mr. E. Burt Fenton has been appointed manager of a new publicity department for the various properties operated by W. S. Barstow & Company, New York.

Mr. G. S. Henry has resigned as general superintendent of the Chicago & Milwaukee Electric Railroad, Highwood, Ill. A successor to fill this vacancy has not been appointed.

Mr. William M. Guy, who recently accepted the appointment of general traffic manager of the London & Port Stanley Railway, London, Ont., electrification of which has just been completed, tendered his resignation on July 3 to return to the service of the Pere Marquette Railroad, for which he has been chief clerk in London for years.

Mr. Irving M. Frost, for three years a director of the Rutland Railway, Light & Power Company, general manager of this concern, and also general manager of the Western Vermont Power & Light Company and the Pittsford Power Company, has forwarded his resignation to W. S. Barstow & Company of New York City, corporate managers of these companies.

Mr. G. R. G. Conway has resigned as chief engineer of the British Columbia Electric Railway, Vancouver, B. C., to enter consulting engineering practice in the East. He was honored at an elaborate farewell banquet at the Hotel Vancouver on June 28, tendered by the company, and highly complimented in a cablegram from the board of directors in London, England. He will continue relations with the company as its consulting engineer.

Mr. John F. Trumbull, formerly chief clerk to the chief engineer of the New York, New Haven & Hartford Railroad, has been appointed chief engineer of the Public Utilities Commission of Connecticut, succeeding Mr. C. C. Elwell, who resigned several months ago to become a member of the commission. Mr. Trumbull was graduated from Sheffield Scientific School, Yale University, in 1902, and has engaged continuously since that time in railroad work on the forces of the International Railroad of Mexico, those of the Connecticut Company and the New York, New Haven & Hartford Railroad.

Mr. James Dewar Fraser, secretary-treasurer of the Ottawa (Ont.) Electric Railway, was elected president of the Canadian Electric Railway Association at the annual meeting of the association held in Quebec on June 21 and 22. Mr. Fraser is a son of the late Andrew Fraser, of Martintown, Glengarry. He spent his youth in Glengarry and entered the employ of W. McClymont & Company, Ottawa, lumber dealers, in 1871, as an accountant and a telegraph operator. He remained with this company until 1882. He was then appointed secretary-treasurer of the Ottawa City Passenger Railway and continued in that position until 1891, when the company was merged with the Ottawa Electric Street Railway as the Ottawa Electric Railway. He has been secretary-treasurer of the company ever since and in 1913 was elected a director of the company. He is also an officer of the Ottawa Car Company, Ltd., and the Wallace Realty Company, Ltd.

J. D. FRASER

OBITUARY

O. W. Jasper, Sr., one of the engineers engaged in the construction of the Northern Electric Railway, Chico, Cal., died recently at Sacramento, aged fifty-seven years. He was born at Wheatland, Cal., and was graduated from the University of California in the class of 1881. Mr. Jasper was well known on the Pacific Coast. He had been engaged in various important railroad engineering projects of the West.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

East Georgia Railway, Savannah, Ga.—Chartered in Georgia to build an electric or steam railway from Glenville, north via Hagan to Adabelle, about 30 miles, with an extension from Hagan to Claxton. Capital stock, \$212,000. Headquarters, Savannah. Incorporators: H. P. Talmage, C. J. Baldwin and E. Leffler. [April 3, '15.]

FRANCHISES

Los Angeles, Cal.—On July 7 the Council of Los Angeles sold to P. D. Cornelius, president Malabar District Improvement Association, the franchise for the extension of the Brooklyn Avenue line on Evergreen Avenue to the east city limits for \$100. The franchise will be turned over to the Los Angeles Railway at once without charge so that the extension may be built.

Los Angeles, Cal.—The Pacific Electric Railway has asked the Council for a franchise to double track its line to San Pedro via Gardena.

East St. Louis, Ill.—The East St. Louis & Suburban Railway has asked the Council for a franchise to extend its lines in East St. Louis to Nineteenth Street and Baker Avenue.

Lafayette, Ind.—The Lafayette & Northwestern Railway, through its failure to file a written acceptance with the auditor of Tippecanoe County, has forfeited the franchise granted by the Council on Aug. 7, 1914. [April 3, '15.]

Henderson, Ky.—The Evansville, Henderson & Owensboro Railway will ask the Council for a twenty-year franchise to operate its cars on the city streets, and proposes to construct interurban lines to Owensboro, Morganfield and Providence, Ky., if granted the franchise.

Haverhill, Mass.—The Bay State Street Railway has received a franchise from the Council to relocate its tracks on Main Street, between Fourth Avenue and Kenoza Avenue; on Water Street, east of Haverhill Street, and on Lincoln Avenue at the City Farm.

Haverhill, Mass.—The Massachusetts Northeastern Street Railway has received a franchise from the Council to relocate its tracks for 240 ft. on Main Street and also at the curves into White Street and to Kenoza Avenue.

North Andover, Mass.—The Bay State Street Railway has asked the Council for a franchise to extend its double tracks from Merrimac Street, North Andover, over the new Shawsheen Bridge into Sutton Street.

Corpus Christi, Tex.—The Council of Corpus Christi has passed the franchise applied for by J. H. Caswell to construct a railway from Corpus Christi to Ward Island. The franchise will be voted on by the people on July 30. [June 10, '15.]

TRACK AND ROADWAY

Marin County Electric Railway, Mill Valley, Cal.—The Railroad Commission of California has issued an order authorizing this company to pay a sales commission of 15 per cent on the portion of its stock remaining unsold, such commission to be paid only when stock has been fully paid up. The company was authorized on Nov. 23, 1914, to issue and sell 185½ shares of stock at the par value of \$100 a share for the purpose of constructing a railway in Sausalito. [July 10, '15.]

Peoria & Chillicothe Electric Railway, Peoria, Ill.—Surveys of this company's line from Peoria to Chillicothe have been completed and the promoters are now ready to go ahead with the financing of the proposition. It is expected that the construction will be begun within a short time. [March 13, '15.]

Kankakee & Urbana Traction Company, Urbana, Ill.—This company is making surveys for the extension of its line from Ludlow to Paxton. A natural grove about midway between these points will be developed into a park by Paxton capitalists.

Sterling, Dixon & Eastern Electric Railway, Dixon, Ill.—This company has about completed the extension of its line in Dixon north on Crawford Avenue from Fellows Street to the grounds of the Illinois State epileptic colony.

La Salle County Electric Railroad, Ottawa, Ill.—Stockholders of this company have been called to meet on Aug. 17 to authorize the completion of the line between Ottawa and Mendota. O. D. Weaver, Jr., 37 South Wabash Avenue, Chicago, Ill., president. [May 22, '15.]

Union Traction Company of Indiana, Anderson, Ind.—A number of important changes have been made by this company at Anderson, including heavier rails and bridges for interurban traffic and a change in the routing of interurban cars in and out of the city. The company has placed 90-lb. rails on all of its right-of-way on Madison Avenue and Sixteenth Street, and the bridge at Sixteenth Street near Locust Street has been rebuilt of heavier material.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—This company has received an extension of time from the Board of Public Works of Indianapolis to Sept. 15 in which to begin the construction of a line on West Tenth Street from Bismarck Avenue to Tibbs Avenue. The time for completion is now set for Dec. 1.

Winona Interurban Railway, Warsaw, Ind.—A report from this company states that it has a good proposition for an amusement company for next year. Correspondence may be addressed to J. C. Schade, assistant treasurer.

Hutchinson (Kan.) Interurban Railway.—A report from this company states that it expects to construct $\frac{3}{4}$ mile of new track in Hutchinson.

Orleans-Kenner Electric Railway, New Orleans, La.—Operation has begun on this company's line from New Orleans to Kenner. E. A. Stanford, New Orleans, president. [Feb. 6, '15.]

Winnipeg (Man.) Electric Railway.—This company is building a 1-mile extension of its tracks on Marion Street, St. Boniface, to the Union Stock Yards. Plans are also being made to reconstruct $\frac{1}{2}$ mile of track on Osborne Street from Kylemore Avenue to River Park.

Boston (Mass.) Elevated Railway.—This company will extend its Hardware Square-Central Square line to the Kenmore Street entrance of the Boylston Street subway via Pearl Street, Brookline Street, Cottage Farm Bridge, Commonwealth Avenue and Beacon Street. The line, which is now operated from Hanover Street to the Cottage Farm bridge via Massachusetts Avenue and Pearl Street, will be run between Hanover Street and Central Square.

Holyoke (Mass.) Street Railway.—On account of the increase in traffic from Holyoke to the Chicopee Falls section, this company is double-tracking its line from the Holyoke-Willimansett Bridge to Margaret Street.

Union Street Railway, New Bedford, Mass.—A petition has been presented to the Board of Aldermen of New Bedford to have the tracks of the Union Street Railway on Dartmouth Street moved to the center of the street. The railway is willing to change its tracks provided the city resurfaces the street.

Worcester (Mass.) Consolidated Street Railway.—Work has been begun by this company relaying its tracks on Main Street from Lincoln Square to Chandler Street. The rails weigh 126 lb. to the yard.

Worcester & Warren Street Railway, Worcester, Mass.—Citizens of West Brookfield have presented to the Council a petition for the relocation of this company's tracks on Main Street, West Brookfield.

Metropolitan Street Railway, Kansas City, Mo.—The city commissioners have awarded a contract to the American Bridge Company to construct a 1500-ft. viaduct at Eighteenth Street, Kansas City, Kan., over the yards of the Rock Island Railway. The viaduct will be a steel and concrete structure with roadbed for wheel traffic, car tracks and sidewalks. The cost, which is estimated at \$115,000, will be shared by the Rock Island Railway, the Union Pacific Railroad and the Metropolitan Street Railway.

United Railways, St. Louis, Mo.—Plans are being made by this company to extend its Tower Grove line on Arsenal Avenue and Ivanhoe Avenue, St. Louis.

Springfield (Mo.) Traction Company.—This company plans to extend its State Street line from New Street to Fort Street and south on Fort Street to Grand Avenue, Springfield.

Moncton Tramways, Electric & Gas Company, Ltd., Moncton, N. B.—This company plans to construct an extension of its line on Bonaccord Street from Main Street to Church Street, about one mile.

Public Service Railway, Newark, N. J.—This company has made application to the Board of Public Utility Commissioners of New Jersey for permission to abandon its line in the borough of Kenilworth extending from a point at Westfield Avenue and Grand Street, near Aldene station, to South Twentieth Street and Boulevard, New Orange. As an alternative to abandoning the line the company asks permission to operate for a single fare of 5 cents for a ride anywhere on the road without giving or receiving transfers from any other line with which the Kenilworth line is connected.

Trenton, Lakewood & Seacoast Railway, Trenton, N. J.—Representing himself and a number of other bondholders of the Trenton, Lakewood & Seacoast Railway Company, George O. Vanderbilt, Princeton, has applied to the Board of Public Utility Commissioners of New Jersey to reopen the proceedings under which the board authorized the company to issue \$190,000 of bonds and \$85,000 of stock. The contention of Mr. Vanderbilt is that the permission granted by the board would permit the exploitation of an over-issue of bonds for the purposes to which the proceeds are to be devoted, and that the result would be to depreciate the value of outstanding bonds. The petition set forth that a competent engineer employed by the bondholders had estimated that only \$135,000 would be required to construct 10 miles of line between Lakewood and Point Pleasant. [June 26, '15.]

Binghamton (N. Y.) Railway.—The Public Service Commission for the Second District of New York has ordered the Binghamton Railway to extend its lines from the present terminus to the northern village line of Port Dickinson.

Brooklyn (N. Y.) Rapid Transit Company.—The Public Service Commission for the First District of New York has received a report from the chief engineer giving the footings of the bids which were opened on July 9 for the installation of tracks on the New Utrecht Avenue elevated railroad in Brooklyn. This is a city-owned line, connecting through Thirty-eighth Street with the Fourth Avenue subway, and running over the route of the so-called West End line to Coney Island. The steel structure is nearly completed, and the commission will soon let the contract for the installation of tracks. Steel rails and other track materials for this line have been already purchased by the commission, and the bids opened July 9 were for the laying of ties, tracks and doing all other work required to put the railroad into operating condition except the work of installing the third-rail and electrical signal apparatus, which will be done by the New York Municipal Railway Corporation as a part of the equipment under the dual system contracts. The work will cover only the elevated part of the line, beginning at about Thirty-eighth Street and Tenth Avenue and extending through New Utrecht Avenue, Eighty-sixth Street and Stillwell Avenue to a point near Avenue Y. The three lowest bids were as follows: Ward & Tully, Inc., \$71,355; Joseph A. McElroy, \$75,183.20, and W. F. Jordan, \$78,525.

Buffalo & Depew Railway, Depew, N. Y.—This company reports that during August and September it expects to build 4000 ft. of track along Ellicott Road and Central Avenue to the passenger station of the New York Central Railway, Lancaster. It has just completed rebuilding 850 ft. of double track on Genesee Street. The company expects to continue the work of rebuilding and ballasting its track during the entire summer.

***Tiffin, Ohio.**—Chicago and New York financiers are interested in a proposition to build a railway between Tiffin and Bucyrus. Much territory for the right-of-way has been offered free of charge. The most favorable route is one via Oceola, Lemert, Benton, Plankton and Melmore.

Berlin & Northern Railway, Berlin, Ont.—This company reports that it is extending its line $\frac{1}{2}$ mile from Bridgeport.

London (Ont.) Street Railway.—This company is reconstructing its single track on Ridout Street from Horton Street to Garfield Street, 4000 ft., with 80-lb. A. S. C. T. rail, supplied by the Algoma Steel Company.

Sarnia (Ont.) Street Railway.—This company is in the market for $\frac{1}{2}$ mile of rails, trolley wire, ties, etc., for use in the construction of an extension of its line from the corner of Christiana Street and St. Clair Street to Clifford Street, Sarnia.

Toronto (Ont.) Civic Railway.—The Mayor and the Board of Control of Toronto have received assurance from the Ontario government that if the work of constructing a permanent civic line on Bloor Street is proceeded with legislation will be forthcoming at the next session, provided the expenditure does not exceed \$125,000. The rails for the line are on the ground and the application was made to the government following the discovery that the city had not received approval for the project. Work on the line, which has been at a standstill for weeks, will now be resumed.

Johnstown & Somerset Street Railway, Johnstown, Pa.—Grading has been begun on the Johnstown end of this company's line from Kelso southward. Owing to a controversy over the rights-of-way through Boswell, it is probable that the line will extend along the edge of the borough instead of through the heart of the town. Plans are being considered to extend the line from Somerset to Berlin, where connection could be made with Meyersdale. G. C. Winslow, general manager. [May 15, '15.]

Philadelphia, Pa.—Bids are desired until Aug. 16 by A. M. Taylor, director Department of City Transit, Philadelphia, for the construction of concrete column foundations and piers for about 26,000 ft. of elevated railway on Front Street, Kensington Avenue and Frankford Avenue, known as Contract 501. Plans and specifications are on file at Room 748 Bourse Building, or may be secured on a deposit of \$10, pending return.

Scranton & Binghamton Railroad, Scranton, Pa.—This company reports that it plans to construct an extension of its lines from Foster to Brooklyn, about five miles.

Montreal (Que.) Tramways.—This company is changing the location of its tracks on Notre Dame Street between First Avenue and Dominion Park to the center of the street and is building an extension of 1.1 miles. The line between Dominion Park and Bernard Avenue, about 4.3 miles of single track, is also being reconstructed. The company has just built about 1 mile of single track from the "Y" at Bernard Avenue to the westerly limits of Montreal East. The rail being used is No. 97 L-399 section.

Rhode Island Company, Providence, R. I.—Arrangements are being made by this company for the laying of tracks on Fountain Street, Providence, and it is expected that cars will be running from Aborn Street to Exchange Place during August.

Chattanooga (Tenn.) Traction Company.—Work has been begun by this company on the construction of a new line on Second Street between Walnut Street and Broad Street, which will connect with the belt railway.

Knoxville Railway & Light Company, Knoxville, Tenn.—This company has begun a considerable amount of improvement work in connection with the city's paving operations. In most cases creosoted ties imbedded in concrete are being used, with a concrete-wearing surface between the rails and on the outside. Wood blocks have been laid on Gay Street. The Cumberland Avenue line will be rebuilt from Ninth Street to the city limits. Plans are being made to build an extension of its line from Fountain City to Smithwood, 1 mile.

Brownsville (Tex.) Street Railway.—Following the granting of a franchise for the extension of its lines, this company has announced that it will establish storage-battery cars on its lines in Brownsville. Service, which was suspended three months ago, will be resumed with the arrival of new equipment in a month. The extension will be made to effect a connection with the Rio Grande Railway to Point

Isabel. It is reported that the company plans an interurban service to the coast towns.

Corpus Christi Railway & Light Company, Corpus Christi, Tex.—This company announces the expenditure of \$100,000 on extensions and improvements to its line. Two of the most important of these extensions are a line about 3 miles long following the bluff line of Nueces Bay to a new residential section of the city and an extension from Epworth-by-the-Sea, the present terminus, to the Nueces County Causeway, about 1 mile.

Dallas Consolidated Electric Street Railway, Dallas, Tex.—This company has practically completed the double-tracking of its line on Bryan Street, Dallas.

Fort Worth & Denton Interurban Railway, Fort Worth, Tex.—It is reported that this company plans to begin work soon on the construction of its proposed railway from Fort Worth to Denton.

Beaumont, Liberty & Houston Traction Company, Houston, Tex.—Surveys have been made of this company's proposed line from Beaumont to Anahuac and Houston. J. H. McCracken, general manager. [May 29, '15.]

Petersburg & James River Railway, Petersburg, Va.—A report from this company states that construction on its proposed railway from Petersburg to City Point will be begun about July 19. The line will consist of $9\frac{1}{2}$ miles of single track, standard gage. Power will be supplied by the Virginia Power Company. J. Walter Long, 110 Bollingbrook Street, Petersburg, president. [June 12, '15.]

Princeton (W. Va.) Power Company.—Operation has been begun to the foot of South Walker Street on this company's line leading toward Bluefield. Work on the extension of the line up Brush Creek Valley is proceeding rapidly.

SHOPS AND BUILDINGS

United Traction Company, Albany, N. Y.—It is reported that officials of this company, the Schenectady Railway and the Albany-Southern Railway will meet in the near future for the purpose of promulgating plans for jointly erecting a terminal station in Albany. It is planned to have a terminal station that will be suitable to all three companies, and to which the companies can jointly contribute for erection and maintenance. The cost of the terminal has been taken into consideration and although no specifications have been drawn, it is estimated to be more than \$100,000.

Niagara, St. Catharines & Toronto Railway, St. Catharines, Ont.—This company plans to construct a station at Niagara-on-the-Lake, Ont., the terminus of its line from St. Catharines to the Niagara River. The structure will be 47 ft. x 25 ft., with an open shed 48 ft. x 20 ft. The building will be of stone up to 5 ft., the balance being shingle construction. The shed will be carried on pillars resting on stone pedestals 5 ft. high. Oak wainscoting with metallic side walls and ceiling will be used for the interior of the building.

Springfield (Ohio) Railway.—During the past year this company has expended about \$300,000 in erecting its new carhouse at East Street and Clifton Street, Springfield, and improving its power plant. The contract price of the new carhouse was \$90,000, exclusive of equipment. The old power plant has been practically rebuilt. New engines and dynamos have been installed and two new boilers are now being put in place. The cost of the improvements being made at the power plant is estimated at \$185,000. Two old frame carhouses on adjoining grounds have been torn down and a third one reroofed for use as a supply room.

Toronto (Ont.) Civic Railway.—The Toronto Board of Control has recently asked for bids for the machine shop equipment of this company's new carhouse at Danforth Avenue, consisting of a 14-in. lathe, 150-ton wheel press, shaper, radial drill, vertical drill, 3000-lb. portable crane, double emery stand, vise, hack saw and a 35-hp. induction motor.

Charlottesville & Albemarle Railway, Charlottesville, Va.—This company reports that the contract has been awarded to the King Lumber Company and work has been begun on the construction of its office building and substation in Charlottesville. The company has also purchased a 200-kw. rotary converter.

Manufacturers and Supplies

ROLLING STOCK

London (Ont.) Street Railway is having a number of its old cars remodeled at Preston, Ont., for pay-as-you-enter service.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., is considering the adoption of pay-as-you-enter cars. One car has been changed for a few weeks' experimental trial.

Michigan Railway Company, Kalamazoo, Mich., has ordered two more all-steel, 70-ft. limited parlor cars from the St. Louis Car Company for the Kalamazoo-Grand Rapids line.

Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo., has this month placed in service four interurban cars built by the Cincinnati Car Company, the details of which, as compared with the cars formerly placed in service, are as follows: length, 59 ft., with truck centers 37 ft. instead of the previous 35 ft. 6 in.; seating capacity, sixty-eight instead of sixty-four persons; aisles 4 in. wider; smoking-car seats finished with fabrikoid instead of leather; fabrikoid curtains; flat window glass instead of curved in curved rear ends of cars; outside door for motorman; prism instead of leaded glass above windows; steel window sash; all double windows; larger toilets; Baldwin trucks; Peter Smith heaters; quadruple equipment Westinghouse 100-hp. motors for operation on 600 volts or 1200 volts; double-end Type H.L. control Westinghouse air-brakes, of the straight and automatic.

TRADE NOTES

U. S. Metal & Manufacturing Company, New York, N. Y., has been appointed railroad sales agent for the injector sand-blast apparatus manufactured by J. M. Betton.

Westinghouse Traction Brake Company, New York, N. Y., has received orders for air-brake equipment for the eight cars recently ordered by the Corpus Christi Railway & Light Company, Corpus Christi, Tex., and the six cars ordered by the New York & Queens County Railway, New York, N. Y.

F. W. Roth, who was formerly secretary and director of the J. N. Johns Manufacturing Company, has been recently appointed general manager of the Railway Specialties Corporation, 29 Broadway, New York City. This concern is manufacturing a motorman's new quick-action, adjustable seat.

Wasson Engineering & Supply Company, Milwaukee, Wis., has just shipped a repeat order for ten air-operated trolley bases to the Michigan United Traction Company, Jackson, Mich. These trolley bases are to be used on the new all-steel, high-speed cars of the Michigan Railway, running on the 2400-volt, third-rail line between Kalamazoo and Grand Rapids, Mich.

Esterline Company, Indianapolis, Ind., has just closed a record-breaking month for its graphic meter sales. In addition to a large list of industrial companies, the following electric railways have purchased instruments during the month of June: Public Service Commission of Indiana, utility watt-meter and volt-meter; Terre Haute, Indianapolis & Eastern Traction Company, ammeter; Virginia Railway & Power Company, Norfolk, Va., watt-meter.

Southern Car Company, High Point, N. C., was erroneously noted in the ELECTRIC RAILWAY JOURNAL of June 10 as having received an order from the Little Rock Railway & Electric Company, Little Rock, Ark., for three buses. The name of the purchasing company should have been the Argenta (Ark.) Railway, which operates on the north side of the Arkansas River. The buses will be used for the transportation of passengers from the cars of the Argenta Railway over the bridge into Little Rock to the cars of the Little Rock Railway & Electric Company, and vice versa.

ADVERTISING LITERATURE

Kernchen Company, Chicago, Ill., has issued a folder describing its siphonage ventilators.

Railway & Industrial Engineering Company, Pittsburgh, Pa., has issued a folder on its suspension lightning arrester.

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued a sheet describing its car mover for moving heavily-loaded cars.

Sprague Electric Works of General Electric Company, New York, N. Y., have issued a folder on their "Spragueduct" enameled conduit.

Beaudry & Company, Inc., Boston, Mass., has issued a catalog describing its hammers for light and heavy railroad machine and general forging work.

Chicago Pneumatic Tool Company, Chicago, Ill., has issued Bulletin E-36 superseding No. E-29, which describes and illustrates its Duntley electric grinders.

General Electric Company, Schenectady, N. Y., has issued a catalog describing its various types of street-lighting brackets and center-span fixtures for mazda lamps.

Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has issued a catalog which contains various magnified sectional views and lists of the composition of its alloys for aluminum and other standard bronze castings.

Dielectric Manufacturing Company, St. Louis, Mo., has issued a booklet on its various types of paint varnish and insulating compounds. The booklet contains tables and data relating to the insulating qualities of these various materials.

Trussed Concrete Steel Company, Youngstown, Ohio, has issued a folder describing a remarkable test which led to the installment of its United steel sash in the plant of the Edison Company. In the test two window sashes were placed on opposite sides of a brick furnace. The furnace was then subjected to a fire of unusual intensity for 35 min. In addition to this ordeal a stream of water from a 3-in. hose was played on the sash structure. After neither test was any sign of weakness discernible.

Stone & Webster Engineering Corporation, Boston, Mass., constructing engineers, have issued a tastefully prepared booklet which describes pictorially the numerous shops, factories, warehouses, mills, offices, educational buildings, power stations, etc., recently constructed by this company. The work includes a wide variety of construction problems which in most instances had to be met within brief time limits. Among the illustrations are included those of hydroelectric power stations of the Mississippi River Power Company and the Pacific Light & Power Corporation.

Westinghouse, Church, Kerr & Company, New York, N. Y., has issued a sheet which contains a potpourri of illustrations of buildings designed and constructed by this company. To show the scope of this work the illustrations are so arranged as to give the appearance of a bird's-eye view of a large city. Such a city, it is said, would cost \$50,000,000. There would be only thirty-three cities as large in the whole United States. To present the idea of size in other ways the sheet states that all the wage earners of Hartford, Conn., could find employment there; over 56,000,000 sq. ft. would be under roof; the building and materials made over 1,000,000 tons of freight, which to haul at once would require a solid train 530 miles long.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued Leaflet No. 3823, describing the construction and operation of rotary converters of the commutating-pole type. A number of construction details are illustrated including a diagram of the brush-lifting device. A number of installation views are also shown. Leaflet No. 3760 describes a.c. remote hand-control switchboards. The leaflet goes into detail in describing the application of this type of switchboard together with the different methods of mounting, such as frame, wall, ceiling, etc., and a typical wiring diagram is given of the connections. Leaflet No. 3820 describes Westinghouse a.c. heavy duty slip-ring motors, type CW. This motor is especially adapted for constant and varying speed applications where continuous service and strong starting effort are required, and where squirrel-cage motors would not be adaptable. Large squirrel-cage induction motors are described and illustrated in Leaflet No. 3787. These motors and their features, adapting them for heavy work, are thoroughly described and illustrations are given of the detail parts.

No. 4

OUTDOOR SUBSTATION DESIGN

Outdoor substations are advantageous from several points of view in electrical distribution systems of moderate voltage. Low cost is one of the chief merits of this class of construction where the line potential does not run up much above 22,000 volts; but economy of investment may be pushed too far. There is room for improvement in some cases, notably in connection with the arrangement of circuits with respect to adjacent structures such as metal stacks; in the provision of wider clearances between lines of different voltage, and in the facilities for disposing of transformer oil in case it has to be drained out of the casings under emergency conditions. In this case a small outlay for pipe connections to a sewer or to a point of discharge at a safe distance from near-by buildings is well made. At least two entrances to the inclosure containing the transformer and oil switch banks are desirable in case trouble in one part of the installation threatens to cut off ingress and egress in entire safety, and the best mechanical construction for pole fixtures is none too good even in an outdoor substation designed for operation at 11,000 volts and over. Double cross-arms, well-secured strain insulators, clean-cut runs of wiring and adequate space around the bases of transformer and switch casings are worth all they cost, and the interests of both safe and convenient operation call for a standard of engineering design and construction not always appreciated by those who erect these structures. In fact, the margin between good work and a down-at-the-heels installation is too small to justify excessive economies in these plants.

LOCOMOTIVE COAL CONSUMPTION

In the discussion on W. S. Murray's paper on the New Haven Railroad's operating costs which was published in abstract in last week's issue, the statement that the steam locomotive required twice as much coal as the electric machine seemed to be something in the nature of a storm center. The problem presented is, of course, decidedly involved, but from such evidence as has been made available the electric locomotive requires some 2.5 lb. of coal for every horsepower-hour produced at the drawbar, making the steam locomotive consume 5 lb. if Mr. Murray's basis of comparison is accepted. As opposed to this there were cited in the discussion the results from a number of laboratory tests in which the coal consumption of a steam locomotive ranged from 5 lb. all the way down to 2.5 lb. per horsepower-hour. However, the laboratory test of a locomotive can hardly be accepted as equivalent to road conditions. In the first place, no

standby losses are included. In the second place, the laboratory test gives the coal consumption at a fixed cut-off, a condition that does not exist in practice. As a matter of fact, the most economical loading is that under which the steam locomotive is loaded right up to its limit so that it works at full cut-off on the ruling grade, and this condition would not be likely to produce a coal rate much less than 5 lb. of coal per horsepower-hour even aside from standby losses. Unfortunately, the different characters of the respective services do not permit accurate comparisons of the coal consumption for the steam and electric locomotives on the New Haven Railroad. However, it is of certain interest to note that the annual coal consumption is about 1,800,000 tons, while the ton-mileage is of the order of ten billions, making a rough average figure of 0.36 lb. of coal per ton-mile. As the average power consumption for the electric locomotives is close to 60 watts per ton-mile, this gives a coal consumption of 0.165 lb. per ton-mile, or actually less than half of that of the steam locomotives.

THE CHICAGO ARBITRATION AWARD

The Chicago arbitration decision will be a disappointment to all who believe in the principles of real arbitration. We expressed the hope at the time the arbitrators were selected that the verdict would not be a mere compromise on the questions at issue but would be based on the merits of the case. But the decision shows that the majority of the board did not take into consideration either the average wages paid for the same work elsewhere or the average wages paid in the building trades and similar trades in Chicago. We see no excuse for a decision, supposed to be fair for both sides, which gives wages higher than those in other large cities east of the Rocky Mountains, when the evidence at the hearing showed that the cost of living is less in Chicago than in St. Louis, Detroit, Cleveland, New York, Pittsburgh, Philadelphia or Boston, the latter city exceeding Chicago by more than 27 per cent. Nor is there any logic in the requirement that the company should pay its trainmen so much more than skilled workmen in Chicago earn in such lines as the carpenter trade, as shown in the statement of Mr. Sheean, or the wages paid to the employees of the city itself in such duties as foremen in the street department, officers in the health department, laborers, motor drivers, etc. An unfortunate feature of the arbitration was the action of the Mayor in taking independent testimony during the hearing by calling in some 200 employees whose wages were directly involved in the arbitration, and questioning some himself and having others questioned by represent-

atives of the corporation counsel's office with reference to the issues involved, without the principals being present or represented. If such action had been taken in a jury trial, and some of the jurors had listened to evidence independently of the other jurors, the case would be thrown out of court, and according to the Illinois Supreme Court action of this kind is equally improper in an arbitration hearing. Nevertheless, the company has announced that it would accept the decision and carry out its provisions faithfully, and it has appealed to the public and the trainmen to co-operate with the management in every way possible to give a better service than ever before. This attitude should command the support of the public in Chicago, and as the city is a partner in the profits of the surface lines to the extent of 55 per cent, it has a vital interest in their financial success. Some of the broader questions raised by the decision of the arbitration board in Chicago are considered in an editorial on the opposite page.

UNEVEN WEAR IN INSERT SPECIAL WORK

Perhaps the principal criticism to be made against the general use of insert special work is the uneven wear which predominates, particularly in insert work in curves over which a dense heavy service is operated. Here the manganese steel insert and the rolled rail or cast-steel arms of frogs are subjected to excessive wear, and the insert, being made of a metal of high abrasion resisting qualities, does not wear as rapidly as the arms. Frequently rather serious variations in the curve alignment occur, due to excessive flange wear, and coincident with this the insert surface is found to be above that of the adjoining rails. Where this takes place, uniform wear throughout the layout is, undoubtedly, desirable. To obtain it, heavy traffic curves should be laid with one kind of material, either open-hearth steel rails and special work throughout or solid manganese steel rails and special work. Some engineers, however, have been successful in obtaining uniform wear and reasonably long life, even where the rails join manganese steel special work, by specifying a high carbon content. If this produces the desired result, it should be practised particularly where greater economy may be obtained by reason of the low first cost.

Frequently the question is raised as to the value of renewable as opposed to non-renewable inserts. No doubt some engineers draw the conclusion that renewable inserts are useless because the work of renewing them is difficult, especially when the frog arms have become considerably worn. This objection is well founded, but other more important reasons govern the use of renewable inserts. We believe that track engineers generally favor this type of insert because it permits replacements in case an insert fails early in the life of a frog or crossing and because the insert can be reset in the field if it should become loose under traffic. These two advantages of the renewable insert are certainly sufficient to make it economically desirable. In many instances where the company's repairmen have become skilled in resetting the various types of inserts, success

in replacing is obtained even where they are badly worn. On the other hand, most insert renewals due to excessive wear are in right-angle crossings. In these the wear on the running rails is slight while that due to impact blows at the intersecting flangeways is great.

In all cases where inserts are renewed, the tolerances in the setting should be measured to provide for thinner plates when necessary. It is possible, however, where the variation is slight, to surface the insert with a grinder after it has been set in position. In connection with the renewability of inserts, it must also be borne in mind that although this is a desirable quality, the fastenings can be such as to make replacements too easy. This may reduce the effectiveness of the fastenings which, in turn, may shorten the service life of the piece. To guard against a weakness of this kind, track and roadway engineers should not specify that their insert fastenings should be designed to make replacements easy, but should insist primarily on a design which will hold the insert secure.

SPARKING AND FLASHING IN RAILWAY MOTORS

The very interesting study of motor commutation by R. E. Hellmund, printed in last week's issue of this paper, must have served to remind users of railway motors of the fact that present conditions in this line are in marked contrast to those of the early days. In the light of the present knowledge of the causes of sparking and flashing the younger generation of master mechanics may have difficulty in realizing how progress was made step by step. The three big and conspicuous steps in this progress were these: The introduction of the carbon brush; the application of saturation in the magnetic circuit to control flux displacement by armature magnetomotive force, and the introduction of the commutating pole. Smaller intermediate steps involved details of design incident to all progress.

The railway motor is inherently inclined to good commutation because, being a series motor, its flux increases with the load. Hence armature reaction, the bane of good commutation, has less effect than in shunt machines because the armature teeth become saturated under heavy load and limit flux distortion. On the other hand, necessary reversibility in direction of rotation prevents the shifting of brushes to the position best for commutation, and space limitations force designers to bring "live" parts closer together than is ideal from the insulation standpoint.

The carbon brush was introduced so early in the history of the commercial railway motor as now to seem a matter of course, but its adoption in place of the earlier copper brush contributed tremendously to success in electrifying horse railways. It provided a simple and cheap means for choking down the currents in the armature coils during the period of reversal. In stationary motors this could be done by shifting the brushes backward from the neutral axis, i.e., against the direction of rotation, but not so in car motors. With surface-wound armatures, and consequent long air gaps between pole faces and armature cores, the

carbon brush could have controlled the sparking evil alone. The field ampere-turns were large compared with those of the armature, and air-gap flux distortion was not serious. But when slotted armature cores, with short air gaps, came in, the case was different. It then became necessary to saturate the teeth heavily to prevent the production of a strong magnetic field along the brush axis, in a position to be cut by the short-circuited coils and in a direction to resist commutation. More recently the commutating pole has been introduced to supplement the effect of saturation and to reduce the necessity for it by providing a reversing flux in a definite location varying with the armature current. In this way it has greatly extended the range of non-sparking and non-flashing operation.

The above is in merest outline the history of commutation in the railway motor. Along with these large developments have gone others only slightly less important. The slotting of commutators, the expert manufacture of carbon brushes and the determination of the proper relation of armature and field turns, of the allowable voltage per commutator bar, etc., have all contributed to relieve the operating man's mind of what was once a bugbear to him. All of the items mentioned have contributed to pave the way for the higher-voltage motor.

LABOR DISPUTES AND ARBITRATION BOARDS

In discussions relating to the wages to be paid to railroad trainmen we think that the public often misses one very important point which distinguishes controversies of this character and those of the same kind between private employers and their employees. The private employer figures upon a certain amount of profit between the price at which he can sell his goods and the cost of producing them, and if the latter is increased because of the necessity of paying higher wages, there are three things which he can do. He can raise the price of his goods to cover the additional cost of production, or he can stop manufacturing entirely and sell his factory at comparatively small loss to someone to conduct some other industry there, or he can sell his factory and move to another place where the wages which he has to pay are lower. The railway, in common with most other public utilities, does not have this choice. It cannot stop operation even if it is not making enough money to pay operating expenses and the interest on its investment, and usually it cannot increase its fares. The business of electric railway transportation in most cities is conducted on a very narrow margin of profit, whose continuance depends on the maintenance of existing conditions. On this basis it has assumed certain burdens, such as pavement charges, street sprinkling, street cleaning, etc., and, in Chicago, enforced extensions with no earning capacity to justify them and the expense of rebuilding the track whenever water pipes, sewers or other underground city utilities are built across them or along them. With any radical change in the basic conditions of operation the close balance between income and

outgo to yield a profit no longer obtains, and if expenses for labor are increased the extra-operating expenses just mentioned should be decreased. No railway manager begrudges an increase of pay to his men where the evidence shows that such an increase is warranted according to the wages paid elsewhere for similar work under similar conditions. But they recognize the economic fact that unless in some way a sufficient margin is maintained between gross receipts on the one hand and operating expenses and fixed charges on the other, present stockholders suffer an injustice and no additional capital for needed extensions and improvements can be secured.

The Chicago arbitration case teaches several important lessons. One of these, and perhaps the main one, is the supreme importance of the choice of the third or impartial arbitrator. In an arbitration case there is legally no obligation on the part of the arbitrators to be governed by the evidence, and in many cases they do not even discuss the evidence in their verdict but simply give their conclusions. We are not prepared to say that this is necessarily wrong, but we mention it to show the difference between a case decided by arbitration and a case decided by law. Cases at law may be decided erroneously as often as cases before a court of arbitration, but the judge in the former case feels obliged to justify his view of the case by an extended statement in which he attempts to prove that his verdict is justified by the evidence presented. Again, while an arbitration board consists nominally of three persons, it really consists of one judge and two counsel, one for each side. This leaves the "third" arbitrator in a position where he is unable to consult with any impartial persons upon the decision. Where the interests involved are large, this is a position of great responsibility, often too great for one man to fill properly, especially when he is in public life and has political ambitions. The whole tendency in modern government where decisions have to be reached from which there is no appeal is to provide more than one arbiter. This is the case with public service commissions, where there are always three and usually five members. It is also the case with the higher courts and the federal commissions. One remedy suggested is an increase in the number of "impartial arbitrators" from one to two or three. Such action would be a step in the right direction. Several men, under such circumstances, would not only be of assistance to each other in arriving at a proper decision, but would be of help in justifying the decision after it was announced. For the same reason, a further improvement, in our opinion, would be a change from one to two in the number of representatives from each side. A single representative has necessarily to be largely a partisan. To be otherwise would seem to be neglectful of the interests of those who had selected him. But with two arbitrators representing a side one would give moral support to the other in reaching a decision based on the merits of the case, even if it did not give all that was sought by those whom he represented.

Long Island Railroad Adopts Light, Steel Trailers

These Cars are Intended for Summer Use Exclusively—Unusual Features of Construction Are Provided for Combining Strength with Lightness

The Long Island Railroad, in order to provide for its heavy suburban passenger traffic during the summer, has ordered from the Standard Steel Car Company twenty new all-steel trailers, the design of which reveals a marked reduction in weight, while preserving a neat appearance and securing unusual strength at the points desired. The new cars were delivered recently, in time for operation during the heavy summer season. They are based in general on the dimensions and specifications of the "MP-54" car, the standard steel, 64-ft. 5½-in. (over couplers) motor car now in suburban electric service on the railroad, and are now being operated in trains with these cars.

The general dimensions are as follows:

Length over body corner posts.....	54 ft. 9¾ in.
Length over couplers	64 ft. 5½ in.
Distance between truck centers.....	39 ft. 9 in.
Wheelbase	6 ft. 4 in.
Height, rail to top of roof.....	13 ft.
Width over side sheets.....	9 ft. 8¾ in.
Width over belt rail.....	9 ft. 10¾ in.

The cars, complete, including trucks, brake rigging and interior equipment, are estimated to weigh only about 68,000 lb., as compared with 87,000 lb., the approximate weight of the motor car without electrical

equipment. The trailer car bodies, fully equipped, weigh about 49,000 lb., as against the motor car body weight of about 54,000 lb., not including electrical equipment.

As the trailers are exclusively for summer service, neither heaters nor headlining are installed. The car body is further lightened by the use of a rather flat-arched roof. The 3/32-in. roof sheets are riveted and welded together in such a manner as to eliminate leakage. The roof is supported directly by combined posts and carlines spaced on 8-ft. 6-in. centers. Opposite carline sections are welded together at the center of the roof, thus forming one continuous inverted U-shaped member. In order to support the low arch without an excessive number of carlines the roof is reinforced in an unusual way by means of two parallel lines of steel purlins, consisting of sections but continuous in effect, running longitudinally from end to end of the car. Each purlin is located 22 in. from the center line of the roof. The purlin sections at carline intersections meet and terminate in flanges shaped around under and riveted to the carline. The purlins transmit extraordinary longitudinal stresses to the roof and sides of the car, a strong vestibule and body end construction being provided.

LONG ISLAND TRAILER—ELEVATION OF CAR

LONG ISLAND TRAILER—SIDE VIEW

LONG ISLAND TRAILER—SIDE ELEVATION AND SECTION OF TRUCK

The purlins receive extra support at each body end by means of two vertical pressed-steel posts 4 in. wide, flanking each side of the 36-in. wide bulkhead door opening. The posts are riveted to the end sills and are tied together by a steel section running across the top of the door opening. The vestibule end posts, shown in the accompanying vestibule plan, are unusually strong and consist of two 12-in. I-beams weighing 31.5 lb. per foot. The purpose of this combination carline, purlin, vertical post and I-beam framing is to distribute the shock of a head-on collision among the members forming the structure as a whole.

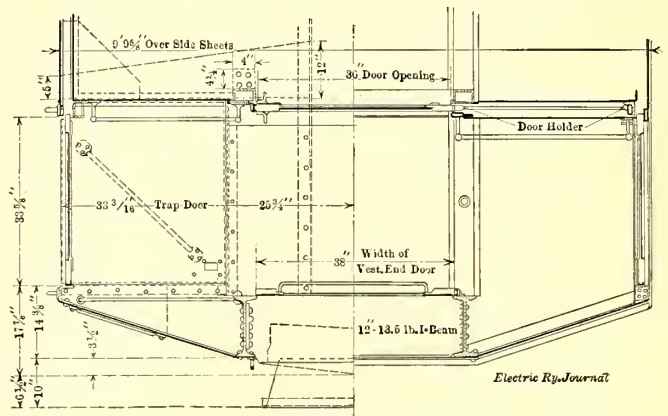

LONG ISLAND TRAILER—SIDE VIEW OF TRUCK

The underframe crossings consist of a number of 5-in. channels and two cantilevers, spaced 26 ft. 6 in. apart, each 14 ft. 1 7/8 in. from the outside of body posts. These cantilevers, together with the body end sills, take the place of the usual body bolsters. No body bolsters are installed, the center plates being attached to the center sills, which extend across the space between the cantilever and the body end sill in the form of a heavy box girder. The extension of this box girder supports the platform. The end corners of the underframe have been specially reinforced by horizontal pressed steel sections in order to protect the body corner from injury by side swiping.

The same principle of combining lightness with strength has been followed in the truck design. The weight of the new truck, including brake rigging nor-

LONG ISLAND TRAILER—VERTICAL CROSS-SECTION OF CAR

LONG ISLAND TRAILER—FLOOR AND UNDERFRAMING PLAN OF VESTIBULE

LONG ISLAND TRAILER—INTERIOR VIEW

mally carried on it, is estimated at 9300 lb., as compared with 13,800 lb., the weight of the trailer truck of the "MP-54" motor car. The new truck, a side view of which is shown, is designed especially to withstand transverse stresses, being provided with a cast-steel bolster. The side gusset fastening to the transom is of extra width to stiffen the connection between pedestal and transom. No end rail is used. The chafing plates are case-hardened and have large bearing areas in order to overcome tilting of the bolster. They are bolted, not riveted, to the transom and bolster, respectively, and therefore are easily replaceable. The spring hangers are supported by chilled cast-iron blocks in order to prolong the life of the support. The trucks have 4¼-in. x 8-in. M.C.B. journals and Midvale Steel Company's 33-in. rolled-steel wheels with 2½-in. rims.

MISCELLANEOUS EQUIPMENT

Ventilation of the cars is provided by "Automatic" ventilators of a new design but embodying the well-known "intake and exhaust" principle of this system. This device, known as Type E-B, is installed at five points, spaced 8 ft. 6 in. apart, on the center line of the almost flat roof. It consists of an exterior hood, divided into four separate compartments, two exterior deflectors, and an interior disk.

The flooring inside the cars consists of monolith laid in Keystone metal flooring. Thirty-six double "walk-over" seats and eight single end seats provide seating capacity for eighty passengers. All seats are rattan covered and have statuary bronze trimmings.

Sliding vestibule side and body-end doors are provided. The vestibule side doors are operated by the Gibbs door-operating device. Diamond pressed plate, 1½ in. thick, is provided for platform floors, trapdoors and steps. Electric lighting consists of thirty 36-watt 130-volt lamps arranged in six circuits.

Other equipment specified includes Westinghouse air brakes, schedule A.T.L., including triple valves, 12-in. x 12-in. cylinder with slack adjuster, auxiliary and supplementary reservoir, Westinghouse friction draft gear, Westinghouse automatic hose couplers, Sharon special coupler, Union Spring & Manufacturing Company's springs, Lindstrom hand-brake handles, National Lock Washer Company's window and curtain fixtures and Pantasote curtain material.

Railway Power Rates in Chicago

Unit Cost for Energy Under the Terms of the 1913 Contract Has Increased Due to Decreasing Load Factor

The sixth annual report of the Board of Supervising Engineers, Chicago Traction, recently issued, contains an analysis of power costs over a period of four and one-half years under the contract described in the issue of the *ELECTRIC RAILWAY JOURNAL* for Dec. 6, 1913, page 1180. Early in 1913 this new contract was executed between the Commonwealth Edison Company and the surface railways. It possessed a number of advantages over the previous contract and was made retroactive, dating back to 1909. The report outlines the important points of the 1913 contract and presents records to show the savings resulting. The contract provided for a sliding scale in primary charge decreasing with a maximum demand from \$1.25 per kilowatt per month for the first 30,000 kw., in 30,000-kw. steps, to 83½ cents per kilowatt. It also provided for a sliding scale of secondary charge decreasing with increasing output from 0.4 cent to 0.36 cent per kilowatt-hour. Under the old contract there was a flat primary rate of \$1.25 per kilowatt of maximum demand and 0.4 cent per kilowatt-hour secondary charge.

CHICAGO POWER RATES—GRAPH OF LOAD-FACTOR VARIATION BY MONTHS

Under the old contract the primary charge would have increased between 1910 and 1913 from 0.337 cent to 0.383 cent per kilowatt-hour, whereas under the new contract it has increased from 0.325 cent to 0.348 cent per kilowatt-hour. During the same period the secondary cost has averaged about 0.395 cent, the limits being 0.397 cent and 0.392 cent per kilowatt-hour. The total cost has increased in spite of the larger amount of energy used, as follows: 1910, 0.737 cent; 1911, 0.741 cent; 1912, 0.760 cent, and 1913, 0.783 cent.

The increase in total cost is due to the larger primary charge, due in turn to the decreased load factor. The change in load factor is shown in an accompanying diagram, and it is explained in the report by reference to the rush-hour conditions which have become more acute each year. The addition of cars during the rush-hour period increases the peak load during that period and correspondingly decreases the load factor. The maximum demand has therefore grown at a greater rate than the total energy consumed.

The second chart reproduced herewith from the report gives in graphical form the basis of the calculation of primary charge per kilowatt-hour for different monthly energy consumptions and different load factors. These curves can be reproduced from the terms of the contract by assuming for each point any

CHICAGO POWER RATES—CURVES OF PRIMARY CHARGE WITH DIFFERENT LOAD FACTORS

maximum demand and load factor. Multiplying these two gives the average load, and multiplying this by 730, the average number of hours in a month, gives the monthly kilowatt-hour consumption. The primary charge per month for the assumed maximum demand is given by the terms of the contract, and this divided by the monthly energy consumption gives the primary unit cost. The chart shows clearly the effect of load factor on this unit cost and, taken together with the load-factor diagram, furnishes an explanation of the increasing total unit cost for energy.

As would be expected, there is a decided seasonal variation in the cost of power, the maximum, which is reached in summer, being higher by 0.15 cent per kilowatt-hour than the minimum, which occurs in the winter months. Graphs reproduced in the report show these seasonal variations.

Pittsburgh Railways Claim Department

A Co-operatively Functional Type of Organization, with the Five Separate Bureaus, Has Been Built Up—
Details of the Various Systems Used Are Published

The claim department of the Pittsburgh (Pa.) Railways, under the supervision of Cecil G. Rice, superintendent, is an excellent example of the application of modern business principles to the work of settling claims. To be more specific, it deserves description on account of its functional type of organization and its recognition of the value of fixed principles, definite policies and psychological essentials in every-day claim work. This article will be confined to a description of the organization itself, and the psychological and other features will be discussed in a later issue.

TYPES OF MANAGEMENT

When Mr. Rice took up the reorganization of the Pittsburgh Railways' claim department more than five years ago, he resolved not to base the practices of his department upon mere imitation of those in the claim departments of other companies or gradually to work out a system for Pittsburgh by means of the "trial and error" process. Instead, it was decided that of the three types of management, "autocratic," "autocratic-divisional" and "co-operatively functional," the last and most modern was best suited to solve the existing problems. According to this decision, active work was immediately begun along the five factors of such management, as follows:

1. Investigation and standardization.
2. Planning of organization to carry the chosen standards into effect.
3. Selection of staff for organization.
4. Provision for compensation, discipline and development.
5. Provision for understudies and recruits.

PRINCIPLES OF STANDARDIZATION

After investigation of the conditions the management evolved six distinct fixed principles of standardization, or standards, in accordance with which every claim employee in so far as possible must bring his thoughts and actions.

These fixed principles are as follows:

1. *Maximum Accuracy*—Incontrovertible facts unearthed from all available sources.
2. *Utmost Expediency*—The promptest action in accord with propriety and correctness.
3. *Absolute Fairness*—A fixed, irrevocable policy of dealing with justice to all concerned.
4. *Persistent Courtesy*—Constant politeness combined with kindness.
5. *Minimum Consistent Expenditures*—Disbursements proportionate to all the facts.
6. *Perfect Co-operation and Efficiency*—Working in harmony to produce the most satisfactory results with the least expenditure of time and effort.

PLAN OF ORGANIZATION

To carry out the above-enumerated standards, the claim department was divided into five separate bureaus to handle the different classes of work. These are called the clerical bureau, the inspection bureau, the adjustment bureau, the litigation bureau and the medical bureau. They act automatically and co-operatively in handling accidents and settlements. Each one is also capable of acting separately as a unit department of the Pittsburgh Railways. All the bureaus are super-

vised by the superintendent of the claim department, who reports directly to the president of the company. It is the desire of the management that each bureau be ultimately known far and wide by its distinctive bureau title and not as a so-called branch of that generally misunderstood and therefore mistrusted "claim department." Only occasionally is the "claim department" referred to in dealing with the public, the bureau concerned alone being mentioned.

Each bureau at its very beginning was placed under a chief reporting directly to the superintendent. Each chief is regarded as and in reality is an assistant superintendent and is of equal rank with the other chiefs. The superintendent each month appoints one chief as the senior chief to act in his absence. Yet the equality of all the bureau chiefs is shown here, too, for they all rotate in appointment as the senior chief.

SELECTION OF STAFF

Of allied importance with the co-operatively functional organization of the department is, of course, the personnel selected to carry on the work. One of the most difficult problems for claim departments to solve effectively is the public feeling that claim agents and their employees are all "thugs," "roughnecks" and tricksters. The first act in selecting employees for the new organization in Pittsburgh was the employment of several college men of pleasing personality for the purpose of influencing the opinion of the public. All the new members of the department came in without previous experience in claim work, but they were rapidly developed along the proper lines and from the beginning helped to inspire in the public a better confidence in the gentlemanliness and integrity of claim employees. The present number of employees is fifty-five, of which eleven are college-trained men. Others were selected from among the platform men or because of some special fitness. Everything else being equal, college men are preferred, but they are always selected in competition with other applicants and not solely on account of their qualification of college training.

PROVISION FOR COMPENSATION

The claim department of the Pittsburgh Railways recognizes the relation that exists between efficient results and the payment of a reasonable compensation for work actually done, both currently and in the future. Accordingly, it does not pay for a certain "job" or a certain "desk" but rather for individual ability and personality. To do this it uses a unit system of efficiency that enables it to make a systematic record of the work performed by each employee and to govern his salary thereby. Each employee makes out a daily report covering the work done, and this is checked by the chief of the bureau. The blank used for such reports, shown in Form 1, has ruled sections for the reporting of all cases returned for credit, the noting in full of all "defects" observed in construction or operation and the making of explanations, remarks and suggestions in connection with anything affecting claim or other departmental work. These individual reports are summarized by the auditor on the monthly comparative efficiency report illustrated by Form 2. At the top of this sheet, which is 19½ in. x 26¼ in., there are separate sections for the inspection bureau, the adjust-

In the foregoing manner the management keeps the employees of the claim department in a satisfied frame of mind as regards their salaries. Occasionally, however, there is found a man who does not find himself suited to claim work. Although the management offers every inducement to permanent employment, yet if any competent employee really desires to change to another line of work, the superintendent is at all times ready to use his best influence to place the employee in another position. Just how tangible this aid is can be judged from this—out of forty-seven previous employees, twenty-two now have good positions secured chiefly through Mr. Rice's influence and efforts. Five men are chief adjusters for casualty companies, and the others hold such varied positions as parole officer and assistant parole officer of Allegheny County, parole officer of western Pennsylvania, chief clerk in the county tax collector's office, superintendent of schools in a New Mexico city, investigator for the Carnegie Hero Fund, practicing attorneys, doctors, secretary to a bank president, city editor of a Pittsburgh newspaper, etc. The attitude that Mr. Rice takes toward these men is exactly that which a university feels toward its graduates. At a meeting of the claim department in December, 1914, held as a testimonial to Mr. Rice, these outside men were present as the "alumni" of the department. They all are still loyal to the department and in every action testify to the spirit of good fellowship that exists between the management of the claim department and the employees, past or present.

PROVISION FOR CO-OPERATION AND DEVELOPMENT

The basis of the co-operative work of the department is a meeting between the superintendent and the members of his staff, held every Saturday at 2 p. m. Besides the bureau chiefs, there are present the auditor and the principal adjuster, whose duties are later explained. At each meeting the work of the last week and the immediate future is discussed, and each staff member is held responsible for knowing as much about the business as the superintendent. The rotating appointment as senior chief and the possible necessity of acting in Mr. Rice's absence makes this responsibility an important one. Those meetings are reported, and copies of the minutes furnished to each member. Later these minutes are bound and preserved in the department library.

To bring about closer co-operation among the employees of each bureau and between them and the management, a meeting of one of the bureaus is held once a month. At this the policies and the acts of the bureau are discussed and all questions put forth by the employees answered. When these meetings are about half over, Mr. Rice usually joins the group for a short talk to the men. The last Friday of each month is devoted to a general meeting of all the employees of all the bureaus, and this meeting is sometimes addressed by attorneys, doctors, executive officers of the company and other prominent persons. Once a year a meeting is set aside for the consideration of suggestions turned in by the department members. Another meeting, a sort of informal reception, is attended by relatives of employees. All meetings are fully reported in typewritten form.

The general meeting of December, 1914, was in charge of the members of the staff and the program was arranged by them. Each bureau chief read a paper in the nature of a review of the changes made in his branch of the work under the present superintendent. In addition, each member of the different bureaus ad-

ressed a letter to Mr. Rice, commenting upon the advancement made as an individual and as a unit of the department. These papers and letters were bound in limp leather and presented to the superintendent. At a meeting held in 1913 an embossed resolution signed by each member of the department was presented to Mr. Rice. This meeting was addressed by the then vice-president and general manager, S. L. Tone.

The work of developing the men is carried on not only through the talks given by the superintendent, the chiefs and the outside experts, but also by the papers which the men read at the meetings. Most papers are read at the general monthly meeting, but some are read in the bureau meetings on subjects relating to particular practices and policies of each bureau or even to more general topics, such as the experiences of delegates attending the American Electric Railway Association conventions, visits to other claim departments, etc. All papers are made out in duplicate, and copies are bound each year and added to the library. Besides the presented papers, the department also has in its library various inspirational books, works on practical psychology, efficiency, scientific management and claim work, as well as many periodicals and all paper books of attorneys. Furthermore, it reprints certified copies of Pennsylvania Supreme Court and Superior Court decisions for distribution to the men, in order that they may at all times be conversant with the final legal decisions in matters relating to claims and allied subjects.

PROVISION FOR PROMOTION, UNDERSTUDIES AND RECRUITS

New men entering the claim department are usually started in clerical bureau work, inasmuch as this requires the least experience and can be most readily learned. The next step is to the inspection bureau, then to the litigation bureau and finally to the adjustment bureau. The medical bureau members, of course, are doctors. In general, the chief of each bureau gives his personal attention to each man under him. If a high-priced man leaves the department, an effort is made to move the men up all along the line. If his work, however, can be transferred to the other members, the pay of the man who left, or a portion of it, is distributed among those who thus increase their efforts.

The plan of organization of the department provides for understudies in all its branches, or men trained to handle the work of their immediate superiors. They are tested during the vacation period. This not only protects the work of the department during absences but also marks out a definite program of advancement for the men if they keep up to and above the standard and if they are fitted for the advanced work. The time for progress from one bureau to another varies with conditions and with men. Some have made the rounds in less than a year, while others may never reach the highest position.

Besides the understudies the department has recruits, or men on the waiting list for employment. Applications for employment in the claim department come from widely-scattered sections of the United States, such as New York, Illinois, Washington, etc. These are all systematically listed for future reference as the way is opened up for new men.

SUPERINTENDENT'S OFFICE

The supervision of the entire claim department is in the hands of the superintendent. He receives a copy of every typewritten letter, memorandum and report received or sent out, and he signs all letters, although

they are dictated by the bureau chiefs. The superintendent has in his own offices a stenographer, who is the only one not under the supervision of the chief of the clerical bureau. Directly under the superintendent's control there is also the auditor, who handles all the accounting records for the claim department and in turn supervises the work of the cashier and the release clerk.

The cashier keeps a card index for all disbursements and all sums paid in the settlement of claims. Cards are kept under the name of the individuals when money is paid to them directly, or under the names of the individuals and their attorneys when payments are made to the latter. The release clerk keeps a record of all cases released and sends word of this final settlement to the proper persons for filing and for preventing any possible duplication or needless assignments. A release taken by an outside adjuster is approved by the chief of the adjustment bureau and checked by the release clerk, the cashier and the auditor before being finally approved by the superintendent.

The two most important records used by the cashier are shown in Form 3 and Form 4. Form 3 is the receipt that is filled out by an adjuster when he receives money needed for the settlement of current claims. He stands charged with the amount turned over to him and must account for it all in cash, properly executed releases, receipts or other proof of authorized expenditures. An adjuster is not allowed to have more than one receipt outstanding against him at any time. The bottom half of the form is retained by the adjuster and is filled in by him before he turns back his remaining money to the cashier. The back of the top half contains similarly-ruled divisions in order that the cashier may place on her record a list of the releases secured and the balance returned. A general requisition is issued by the claim department upon the auditor of disbursements of the company in order to be

CLERICAL BUREAU

reimbursed for amounts expended for the releases listed in the requisition.

One of the most novel creations of the present management is the "satisfaction book." This book contains a record of all cases which have been decided in court for less than the claimant had originally been offered by the company in settlement, or in which verdicts were returned in favor of the defendant. The cases are indexed according to the character of the accident, the street and geographical location of the claimant and the attorney involved. The adjusters have access to this book and each chief has a copy. It is very useful in showing claimants that certain attorneys "who have won every case" have lost particular cases perhaps like the one in question, in furnishing claimants with names of neighbors who can testify as to the foolishness of taking cases to court, and in offering concrete proof that the company has itself in so many cases in its first offer exceeded what the courts later held to constitute a fair settlement.

The superintendent maintains in his own office an index of all the attorneys in the three counties served by the company and also files the reports from the several bureaus and all statistical reports. Aside from the regular periodic statistical reports showing the work of the department, there might be mentioned as one example of special statistical investigation the time study that was conducted to ascertain the most agreeable hours of calling for various classes of men who come to the company offices to discuss claim subjects. It was found that the time generally preferred by claimants was from 10 a. m. to 4 p. m., while attorneys could most conveniently call from 8 a. m. to 10 a. m. and from 3:30 p. m. to 5 p. m., and employees were able to report at any time. This investigation made it possible to arrange the calling hours so as to cause the least conflict between the first two classes, the employees being used mostly to fill up any light periods.

The superintendent also keeps a file giving the complete records of all the men employed in the claim department. Moreover, he has a pocket list showing the names of the men, their telephone numbers, the time required for each man to reach the office after notification and also the time required to reach the nearest carhouse. Each member of the staff has a copy of this list.

Now and then, under the superintendent's direction, a check is made with comptometer cards to see how much time is being spent upon some particular operation in the bureaus, such as indexing different papers, dictation, transcribing and similar acts. This

is done in order to keep efficiency up to the proper standard and to divide the time rightly between different operations. Each of the seventy forms in use is original, and, before a supply is reordered, is checked by the superintendent and the chiefs for improvements or changes. Furthermore, twice a year suggestions are solicited from every employee in the department as to changes in the methods of doing the work or the elimination of any feature. Suggestions, however, are welcome at any time. In these ways waste motion is avoided and errors are corrected. Accuracy and speed are the ends sought.

ADJUSTMENT BUREAU

The adjustment bureau of the Pittsburgh Railways contains the chief of the bureau, the principal adjuster and four outside adjusters. Under the original plan of organization the principal adjuster was not included, but as the work developed this office was created. All claimants calling at the department offices are received by the principal adjuster, who works in close harmony with the outside adjusters and the bureau chief. During 1914 he alone settled 2900 claims, an average of eight a day. The chief of the adjustment bureau has to do with cases that are settled on the outside and has charge of the four outside adjusters. The principal adjuster is really a master adjuster handling a particular class of cases, and he has no more authority than the chief of the adjustment bureau. Both of these men report directly to Mr. Rice, and neither would ordinarily pay more than \$300 in settling a case without consulting him.

At 8 a. m. the adjusters report at the office, where they have a separate desk and the services of a typewriter operator, who takes their dictation directly on the machine. Every act in connection with any case is a matter of record. During most of the day the adjusters are outside and report by telephone four times. The process of adjusting cases is largely a matter of judgment on their part. No adjuster, however, would think of paying more than \$100 without an authorization from the chief of the adjustment bureau. There are, in general, four steps in adjustment work, as follows: (1) The adjuster settles by using his own judgment; (2) the next morning, if the case is not settled, the adjuster turns it over to the chief of the adjustment bureau for decision; (3) if the chief does not desire to pass upon it, it is put up to the superintendent of the department, and (4) if the superintendent should be in doubt, the case is presented to the "board of claims review," composed of the president, the superintendent of the claims department, the general attorney and the general manager. The number of cases presented to this board is a matter to be determined by the superintendent of the claim department.

The chief of the adjustment bureau maintains a follow-up file of every current claim pending and is at all times in possession of all essential facts. During 1914 three-fifths of all settlements made were effected in the offices of the claim department, an increase of 50 per cent over 1912. This shows the growing tendency of the public to handle claims as "a matter of business" instead of "a matter of law," as well as the fact that the prejudice of the public against the department is being speedily overcome.

INSPECTION BUREAU

Besides the chief, the inspection bureau is composed of a statement inspector, who takes statements from all persons calling at the offices; a photographer; a night inspector, who is on duty from 6 p. m. to 6 a. m.;

an estimator, a veterinary surgeon, safety inspectors with offices at selected carhouses, secret service operatives and six inspectors. It is the function of these men to secure all particulars regarding accidents. The estimator inspects damages to physical property, the veterinary examines injured animals and the photographer takes assignments in duplicate from the chief of the bureau. The safety inspectors at the various carhouses interview trainmen, typewrite statements and inspect equipment involved in accidents. The claim department is open twenty-four hours a day, and after business hours the night inspector sends out inquiry blanks, clips newspapers, receives all telephone reports of accidents and notifies the chief or the superintendent in the event of a severe accident.

LITIGATION BUREAU

When a claimant enters suit against the company, the department receives a notice from the general attorney. After being reviewed by the superintendent, the case then goes to the litigation bureau. If all witnesses have not been seen, however, it is referred to the inspection bureau for such action and is then returned to the litigation bureau for preparation for trial. Under any conditions the case goes finally to the litigation bureau when it is placed upon the court calendar.

Under the chief of the litigation bureau are the principal court investigator, the principal locator, the court investigators, four locators and the court clerk. The locators are used to see that witnesses are in court when needed. They act as investigators when court is not in session. The court clerk each evening secures from the clerk of the court a list of the cases to be called the next day and a list of suits entered that day. He also obtains a summary of all damage suits entered in the county against anyone and a summary of all verdicts rendered against any defendant, which are made a matter of record in the claim department.

The litigation bureau keeps a card file for every suit entered and also an index of legal opinions. Transcripts of testimony, records of appeal, etc., are filed in this bureau. It also maintains a record of all witnesses for and against the company in the cases that arise. The witnesses in new cases are then checked up by any existing testimony in other cases, so that "ringers" cannot be used.

MEDICAL BUREAU

The medical bureau proper of the company consists of a chief, an examiner and a stenographer-nurse. The men spend most of their time in the offices of the department. For any special injury the chief arranges to call in the best expert in that particular line. The company maintains an examination room where claimants are examined and sometimes emergency treatment is given. The bureau has a separate medical library, charts, skeleton, operating chair, instruments and complete surgical and examining equipment. The chief co-operates with the trial attorney in arranging the medical defense in litigated cases and with the chief of the adjustment bureau in current claims.

In the medical bureau there is a card file of all doctors with whom the company has had or may have dealings. This list is indexed by doctors and by subjects. The verbatim reports of court testimony are secured where doctors who make a practice of testifying against the company are called. The list at present contains the names of about 3000 doctors, showing their hospital and other connections and a summarized record of all the cases in which they have been interested either in making examinations or in giving treatment. The company

receives medical magazines from all parts of the world and clips these for important articles.

CLERICAL BUREAU

Besides the chief of the bureau, there are several clerks performing various duties in this and other bureaus. All mail is opened and dispatched in the clerical bureau. Moreover, with the exception of the special files kept in the superintendent's office, the litigation bureau and the medical bureau, all other files are kept in the clerical bureau, so that the main duties of the clerks there have to do with the making and the filing of records.

The only two permanent files in the clerical bureau are the general index and the information file. The general card index is for every person involved in any kind of accident with the company or with any other company for which reports are available. Newspaper reports and reports from other companies and claim departments in regard to fraudulent claims are included. Form 4 shows the character of the index card used. The main divisions of the classification are according to the surnames and the subdivisions according to the first names of claimants. Under each division and subdivision the cards are separated according to a tab showing the month in which each accident occurred. The cards used for males are gray; for females, pink, and for property damages, yellow.

The other permanent file referred to above, the information file, is a record of any person, connected with any company, who is known, either favorably or otherwise, to any employee of the railway; a record of the residences of all attorneys, etc. This file is divided in the following manner: (a) an index according to streets—that is, cards for the blocks numbered from 100 to 200, from 200 to 300, etc.; (b) an index by companies; (c) an index by occupation, and local trade and other organizations, and (d) an index of all employees of the Pittsburgh Railway, the Duquesne Light Company, the Beaver Valley Traction Company and the Philadelphia Company. These are arranged geographically in order that an employee may be found who lives on the same street as any claimant. The first three indices are cross-referenced with the general index file to show any case with the company in which the individuals may have been involved.

RECORDING OF ACCIDENTS IN CLERICAL BUREAU

In the clerical bureau there is also an accident register in the form of a loose-leaf book, run by days of the week. This book takes sheets 17 in. x 26 $\frac{3}{8}$ in., ruled alike on both sides. From left to right columns are provided to show the consecutive numbers of the accidents, the time, the car and division numbers, the location, the nature of the occurrence, the principals and their addresses, the names and numbers of the motorman and the conductor, the classification number of the accident, and the original assignment to an adjuster or an investigator. A note is made at the bottom of the sheet in regard to the weather conditions existing on the day in question.

Accident reports are made out by car crews or the safety inspectors in triplicate and forwarded to the clerical bureau, where they receive classification numbers, are checked up with the general index and the information file and then go to the chief of the adjustment bureau. The latter reads them and assigns such as he thinks should go to adjusters. The others he sends to the chief of the inspection bureau, who assigns them as he sees fit. If any information along medical lines is needed, a memorandum is sent to the medical bureau.

Probably nine-tenths of the accidents reported by crews have previously been reported by telephone by inspectors, dispatchers, or local or division superintendents. If none of these officials is met and the line is not tied up by stopping, the accident is reported over the telephone by the motorman and the conductor themselves. For instance, if a woman at 9 o'clock in the morning had an accident and this was telephoned, five copies would be made, one for the superintendent and copies to the clerical, medical and inspection bureaus. The inspection bureau would in a short time be seeing witnesses and learning the essential facts, the medical bureau would ascertain by examination or inquiry the extent of the injury, an adjuster would be informed as to the name and address of the woman in order for him to secure her statement of the occurrence, and the clerical bureau would search the records and consolidate the information secured by the other bureaus with the crew's report. Final decision as to adjustment could then be made by the chief of the adjustment bureau.

CARD "KINKS" IN CLERICAL BUREAU

Besides the general index file and the information file previously described, the clerical bureau of the

PITTSBURGH RAILWAYS CLAIM DEPARTMENT—FORM 5— CHERRY CARD USED TO KEEP TRACK OF CLAIM DEPARTMENT DOCUMENTS

Pittsburgh Railways has three original card "kinks" that have been developed by the management to aid in the general smoothness of the work. These are the "cherry" card, the "reminder" card and the "reception room" card.

The cherry card was devised by Mr. Rice in order to keep track of case files and documents. One of the most troublesome office problems in claim departments is to know at any time where the records of any case are located. By the use of the cherry card, shown in Form 5, this problem is easily solved. Every time a case is moved from one person or one desk to another, one of these cards must be filled out, the person from whose possession the case is moved being held responsible for the recording of the transfer. The card provides for case number, name of principal, date, exact time of movement, name to be charged with the case data and name to be credited, remarks and spaces for initials of charging person. A constant messenger service is kept up around the department to collect all the cherry cards. These are filed by case numbers in the central file, and the clerk in charge of this can at any minute of the day tell exactly where any document is located.

The reminder card is a unique scheme to call certain things to the attention of employees at the proper time without them being burdened with constant memory in the meantime. Any employee desiring to be

reminded of any engagement to call, appointment at the company's office, letters to be expected, papers to be returned, work to be completed by a certain time, cases to keep in touch with, etc., simply reports such facts to the proper stenographer or else himself fills out a reminder card, as illustrated in Form 6. This provides for three dates on which the employee will be reminded as requested. The cards are filed in the clerical bureau according to reminder dates, and each employee at the proper time has the stated matters brought to his attention.

The reception room card furnishes information for bringing callers into a more intimate relation with the claim department and putting them into a better frame of mind by telling them in a cordial and perfectly casual way that they are expected. Each employee who expects a visitor at the company's office fills out a reception room card (see Form 7), which goes to the clerk at the desk in the reception room. Each morning this clerk sorts out the cards for appointments on that day and carries the names in his mind. When one of the expected callers arrives, he is met with the statement: "Mr. ——— is expecting you. If you will just sit down for a moment, I'll take your name right in," and he is properly impressed thereby. The re-

sponsible for recording on the cherry cards all documents that leave the vault. The record clerk has charge of the accident register. Besides these and a messenger, there are five clerks and stenographers who are located in the various bureaus but are under the supervision of the chief of the clerical department.

NOVEL LIBRARY FEATURE

A novel and original feature has recently been added to the department. A hallway, 8½ ft. x 50 ft., has been partitioned off, the walls decorated and lighting fixtures installed. The room is fitted with "Crex" rugs, bookcases, easy chairs, magazine racks and telephone, and made generally but inexpensively attractive. It is used during the day as a reception room for callers, and the framed pictures advantageously placed add attractiveness and at the same time serve to impress certain facts upon claimants. As compared with the old idea of having the first room visited by a claimant represent poverty by its bare floor and wooden furniture, this feature of reversing the impression into one of comfort, attention, courtesy and resources for defense against unfair claimants, is a distinct departure. After business hours this library-reception room is used by the members of the department as a

ception room clerk also keeps a daily list of all callers, showing the names, time of arrival and admission, men visited, references to other officers, time consumed in calls, case numbers or names concerned, and total number for day.

DIVISION OF LABOR IN CLERICAL BUREAU

To show the careful division of labor in the clerical bureau among the different employees, it may be noted that there is a general index clerk to handle the general index and an information clerk to look out for the information file. The classification clerk classifies all accidents according to twenty-two general divisions and 125 subdivisions and gives each one the number that shows on the accident register and in the case records. The index clerk operates the cherry-card file and the reminder-card file. The trace clerk is used to hunt up the data on past cases, locate files and number and dispatch incoming letters and memoranda. The reception room clerk receives callers, records the time and keeps the reception room card file. The photographer's clerk classifies all photographs, assignments and photographic records. The copy clerks work in the litigation bureau, and, when a suit is entered, make two copies of all documents, one going to the general attorney, one to the men in the litigation bureau and the original back to the vault. This general vault is in charge of a separate file clerk, who is re-

PITTSBURGH RAILWAYS CLAIM DEPARTMENT—FORM 7—
RECEPTION ROOM CARD NOTIFYING RECEPTION ROOM CLERK OF EXPECTED CALLERS

place in which to work, read, study, lounge or meet their friends. Hereafter the various meetings of the department will be held here.

GENERAL FACILITIES

The department occupies fifteen rooms and vaults, all neatly and attractively equipped and maintained. All filing and other equipment is modern and sanitary. Washstands, individual towels, sanitary water coolers and drinking cups, shoe shining cabinets, telephone booths, scientific lighting fixtures and general neatness serve to impress employees and others that this is a modern business organization which gives and demands respect. Intercommunicating telephone equipment with a loud-speaking master station in the superintendent's office allows him to get in instantaneous touch with any bureau or all of them at once.

The library of the Bureau of Railway Economics, Washington, D. C., has recently prepared an exceptionally complete list of references in current periodicals to the jitney bus and to regulatory measures that have been introduced to curb the irresponsible factors in the movement. There are about 140 articles indexed in the list, of which nearly 40 per cent are from the ELECTRIC RAILWAY JOURNAL. The bibliography is dated July 15 and is in mimeograph form, a limited number of copies being available for distribution.

Employees Receive Increase in Chicago

Reduction in Number of Years to Reach Maximum Wages Also Made by Decision — James M. Sheean, the Company's Representative, Files Dissenting Opinion

Mayor Thompson and State's Attorney Hoyne, representing the majority of the Chicago Board of Arbitration, handed down an award on July 16 granting a uniform increase of the maximum and minimum wage of 3 cents for the first year and 4 cents for the second year of the contract, and also a reduction of the graduated scale from a five-year to a four-year term. Employees outside of the train service also received substantial increases, and the award includes some concessions in the working conditions. Attorney James M. Sheean, representative of the surface lines, filed a dissenting opinion which shows that, despite the preponderance of evidence presented by the railway companies tending to show that the demands of the employees were excessive, the majority of the board of arbitration granted wage increases and improvements in working conditions. One compensating fact in the decision is that the city must share 55 per cent in the increased operating expenses and that the employees' demand that a graduated scale be abolished was not sustained but reduced from a five-year to a four-year term.

FINDINGS ON SEVEN QUESTIONS SUBMITTED

The decisions of the board of arbitration regarding the seven questions submitted are as follows:

To Question 1—Percentage of straight runs and consecutive hours in which swing runs shall be completed. The arbiters decided that all runs on Sundays should be straight time and should not exceed nine hours.

To Question 2—Hours of service, including week days, Sundays and holidays, for employees other than trainmen provided for in the agreement. The arbiters decided that the existing system should be continued except as it might be modified by the other points decided in this arbitration.

To Question 3—Number of years to receive maximum wage scale and wages for all trainmen, including trainmen on cinder, sprinkler, supply and other cars. The arbiters decided that during the period fixed by this award the following scale of wages should govern:

FIRST YEAR OF CONTRACT				
	Old Scale, Cents	Offered by Company, Cents	Demanded by Men, Cents	Award, Cents
First year:				
First three months.....	23	25	33	26
Second three months.....	25	26	33	28
Second six months.....	26	27	33	29
Second year:				
First six months.....	27	28	36	31
Second six months.....	28	29	36	31
Third year.....	29	29½	36	32
Fourth year.....	30	30	36	33
Fifth year.....	31	31	36	35
Sixth year and thereafter..	32	32	36	..

SECOND YEAR OF CONTRACT				
	Old Scale, Cents	Offered by Company, Cents	Demanded by Men, Cents	Tentative Draft of Award, Cents
First year:				
First three months.....	23	25½	33	27
Second three months.....	25	26½	33	29
Second six months.....	26	27½	33	30
Second year:				
First six months.....	27	28½	36	32
Second six months.....	28	29½	36	32
Third year.....	29	30	36	33
Fourth year.....	30	30½	36	34
Fifth year.....	31	31	36	36
Sixth year and thereafter..	32	32	36	..

The scale of wages shown in the foregoing table also applies to motormen of sprinklers, cinder, supply, mail and other cars. Trolley boys or conductors on sprinkler, cinder, supply, mail and other cars will receive a wage of \$2.30 per day. All men working on snow plows and

on snow sweepers will have a wage rate of 36 cents per hour. The wages of other employees decided by the board of arbitration are as follows:

	Month
Car repair foremen (day).....	\$125
Car repair foremen (night).....	110
Receivers.....	105
Tunnel and bridge men.....	75
Flag and crossing men.....	65

Mechanics in west side shops not under union contract will get a 3 cent an hour increase.

Car repairers, motor repairers, inspectors, dopers and body repairers will receive \$2.40 in the first year of service, \$2.70 in the second year, and \$3 in the third year.

Car placers, \$2.40 in the first year of service, after that \$2.75 a day.

Cleaners, janitors, washers and other line men, \$2.10 a day in the first year of service and \$2.40 thereafter.

To Question 5—Allowance for turning-in time. The arbiters decided that all trainmen should be allowed to have seven minutes after finishing the day's run for turn-in time, which was an increase of two minutes.

To Question 6—Seniority and efficiency with men outside of train service. The arbitrators found that in all cases where men were laid off to reduce the force, this should be done according to seniority primarily, but consideration might be given to their capacity and fitness. When these men are again put to work they should be reinstated according to their seniority standing at the time they were laid off.

To Question 7—Night car hours and wages. The arbitrators found that the men operating night cars should receive \$3 per night for eight hours or less, and all-night car runs should be straight and not more than eight hours. The night-car wages and hours specified in this award become effective on Jan. 1, 1916.

DISSENTING OPINION OF JAMES M. SHEEAN, THE COMPANY'S REPRESENTATIVE

"I dissent from the award made by the majority of the board.

"My position throughout this arbitration has been that the employees are entitled to a fair wage fully commensurate with the work performed, but I submit that these men are already paid not only a fair wage but a liberal wage when the wages in the same employment and the living conditions in other large cities are taken into consideration, or when comparison is made of annual earnings of these men with the earnings in any comparable line of work in Chicago.

"The evidence in this case shows beyond all question that the wage scale paid the trainmen in Chicago, taking into account the bonus time, including time for meals allowed, is higher than the wage scale in any other large city east of the Rocky Mountains. The scale in Chicago, taking into account the bonus time allowed the men, gives a higher average wage than that paid in any of the twenty cities the wage scales of which were submitted to the board of arbitration.

"Sixty per cent of the trainmen in the employ of the company are now receiving the maximum rate of 32 cents per hour, and their average earnings are in excess of \$1,000 per annum. Many of these men are now earning in excess of \$100 per month, or more than \$1,200 per annum. Compare these earnings with the

earnings of carpenters in Chicago, who are employed only about 160 days a year, and whose earnings are about \$800 per year.

"This situation is shown by the following extract from a letter dated April 23, 1915, written by John A. Metz, president of the carpenters' arbitration board, to the State board of arbitration:

"Now, a few years ago the average carpenter worked about 200 days per year, but now by reason of the evolution in the building industry, this average is cut down so that the average carpenter now earns little more than \$800 per year."

"The same basis of annual earnings applies also to the other building trades in Chicago.

"Or, take the compensation received by men employed by the city. The evidence shows that the average monthly wage of 4589 employees upon the payrolls of Chicago for the month of May, 1914, including such men as foremen in the street department, officers in the health department, laborers, motor drivers, etc., was \$55.18.

"The evidence in this case shows and, in fact, there is no dispute, that the cost of living in Chicago is materially lower than the cost of living in such cities as New York, Boston and Philadelphia, although the wages paid trainmen in Chicago are higher than the wages paid trainmen in any of those cities.

"The evidence is also uncontradicted that the cost of living since the last award three years ago has not increased as fast as the wages of the employees. The record shows that the wages of the trainmen have increased during the past three years 9.2 per cent, while the cost of living, according to the statement submitted by Mr. Mahon in 1912, and compared with a similar statement filed by him in this arbitration, has increased only 5.34 per cent.

"In 1909 the men voluntarily agreed with the companies upon a five-year scale. This was submitted to arbitration in 1912 and again fixed at the period of five years. Experienced operating men called on behalf of the company stated that the best results from every standpoint were obtained from a five-year scale and that the purpose of this scale was to compensate the men for their gradually increasing efficiency and give them a reward for remaining in the service.

"Evidence introduced shows that the average length of the scale in twenty of the principal cities of the United States is over five years. In fact, a graduated scale for teachers in force in our public schools ranges from five years to ten years. Notwithstanding this, however, the majority of the board reduced the scale from five years to four years.

"Prior to 1912 there was a limited night car service in effect on the north and west sides of the city. These men worked six hours and were paid a bonus or extra rate for this service. No such arrangement has ever existed on the south side. The effect of the night car bonus was to penalize and make still more costly an unprofitable service. The result was that on the south side lines, where no penalty was imposed, the night car service developed to a far greater extent than on the north and west sides.

"In the 1912 arbitration the night car bonus was abolished throughout the city, and Judge Carter in discussing this question, in his opinion, said:

"Extra pay or a bonus for night car service has been in force for years on the north and west side lines of this city, but it has not been on the south side lines in recent years, or to any substantial extent since electricity was introduced as a motive power. Whatever might be said in justification of this plan in the days when horse cars were in use, I can find no evi-

dence in this record that furnishes a valid reason why the men who operate the cars between twelve o'clock midnight and six in the morning under the present operating conditions, should receive more pay than the men who operate the cars at other hours of the twenty-four. Electricity so lights up the streets that it is practically as easy for the motorman to see the track ahead of him at night as in the daytime. Then, too, the evidence shows that the character of the traffic during the night in recent years has changed materially. I am of the opinion that greater skill and experience is required in the operation of cars during the rush hours of the morning and evening than for the operation of night cars."

"The majority of the board, however, has restored the old plan of paying a bonus for the operation of night cars. The result of this will be to impose a heavy additional burden upon the company and in such a way as to retard rather than to develop this class of service.

"The majority of the board has also given a corresponding increase to the carhouse men and shop men. The evidence in the record shows that the pay already received by these men is materially in excess of the wages now being paid even by the steam roads for the same class of service. The majority of the board has also, by its ruling, still further increased the bonus or dead time allowance for which the men are at present paid, and which already amounts to more than \$1,000,000 per annum. All of these matters must be taken into account in determining the actual pay which the employees of the company will receive under this award, and the actual amount as shown is very materially in excess of the actual figures appearing in the scale.

"Common observation and experience show that the present is no time for drastic wage increases in any business. This is particularly true with reference to the company, which has been affected to a greater degree than most institutions by the general financial and industrial depression now existing in Chicago. Last year the receipts fell more than \$500,000 below the receipts of the preceding year, and during the first five months of the present year the company's receipts have dropped more than \$600,000 below the receipts for the same period last year.

"The company is carrying fewer passengers this year than last year, and its receipts per car-hour have decreased accordingly. On the other hand, as a result of the graduated scale under which the men are now working, their wages are automatically increased the longer they remain in the service, so that the company is now facing not only a heavy deficit in its gross receipts and decreasing receipts per car-hour, but a constantly increasing wage.

"In the face of this, however, the majority of the board has not only shortened the scale from five years to four years, which in itself operates to increase the wages of the men, but has further increased the maximum wage per hour during the first year of the new contract from 32 cents to 35 cents, and during the second year of the contract from 32 cents to 36 cents. The maximum demand of the men in 1912 was 35 cents an hour, and the maximum demand at this time was 36 cents an hour. In other words, the men have been given substantially all they asked for, yet no one will seriously contend that the men in making a demand for 36 cents an hour expected to receive that amount, or anything like that amount.

"It must not be forgotten that the situation with the company is very different from that of a manufacturing concern, or even that of a steam road. An increase in the wages among the employees of manufacturing con-

cerns means an added cost to the manufactured product. An increase in wages to the employees of our great stores means only that the purchaser will pay an increased price for the articles purchased, and even a steam road has some opportunity to increase its rates; but not so with the company.

"The fare received by the company for the service rendered by it is 5 cents and no more. The company's compensation is fixed. On the other hand, the cost of rendering the service, the increasing cost of wages, the increasing expense of maintenance and operation are constantly narrowing the margin left for the return upon capital.

"Recognizing, as I do, that the service rendered by the company is the joint product of labor and capital, and believing, as I do, that both labor and capital should have a fair return, it has seemed to me that this award so unfairly increases the proportion of the one at the expense of the other that its result must be to make Chicago an unattractive field for capital.

"Chicago needs capital and must compete with other cities in procuring capital for its development, and in the last analysis the determining factor will be the fairness or unfairness with which investments already made in this city are treated.

"One difficulty with which the arbitrators have had to contend was lack of time to enable the board to take up and properly analyze this record, which contains a vast amount of facts, figures and details. We have had but four conferences in this entire matter, and at only two of these conferences were the merits of any of the men's demands discussed, and then only those with reference to wages and length of the scale for trainmen. No discussion whatever was had with reference to the other six propositions submitted to the board of arbitration.

"The agreement under which this arbitration is had provides that the board shall meet and organize, set the time and place for hearings, and continue 'until all evidence and arguments have been heard and rulings rendered.' This means that whatever evidence was heard should be submitted before the board at a regular meeting, at which all parties were represented. Contrary to this, and to all established principles of arbitration, the Mayor, against my protest and the protest of Mr. Hoyne, the representative of the men, saw fit to call in some 200 employees whose wages were directly involved in the arbitration, and questioned some of them himself, and had others questioned by representatives of the corporation counsel's office with reference to the issues involved in this arbitration—all without the principals being present or represented.

"In the case of *Moshier vs. Shear*, 102 Ill., 173, our Supreme Court said:

"After being selected, it is the duty of an arbitrator, like a juror, to act fairly and impartially between the parties and on the evidence adduced before them on the trial, and entirely independent of all outside influences, and what will be misconduct on the part of a juror will, as a general rule, be such on the part of an arbitrator. Neither has a right to learn facts except as brought to his attention on the trial. It is gross misconduct for either to seek evidence or the opinions of others in regard to the case, or anything material to its decision in another mode."

"The company, in view of the great public interest involved and the possible effects of such course upon the best interests and welfare of this community, has decided not to avail itself of its legal rights in this particular.

"I have endeavored to state my views frankly. I cannot concur in this award. I cannot concur in the

method by which the award was reached; but, notwithstanding this, the company which I represent, wishes it distinctly understood that this award will be accepted and faithfully carried out. The company has stood, and will continue to stand, for the principle of arbitration, regardless of whether the outcome in any particular arbitration favors one side or the other."

(Signed) JAMES M. SHEEAN.

STATEMENT BY CHICAGO SURFACE LINES

As an aftermath to the arbitration award the Chicago Surface Lines ran an advertisement in each of the Chicago papers under the caption, "Car Men Win." In this the company accepts the victory of the employees "like a good sport" and takes advantage of this propitious occasion to take up the question of complaints, and asks the public to criticize and commend. The text of this advertisement is so unusual that it is printed in full as follows:

CAR MEN WIN

In the most sweeping award ever made by an arbitration board, our employees have just won an increase in wages which makes them by far the most highly-paid street railway men in the United States.

This award has imposed an enormous additional burden upon the company—approximately \$1,500,000 per year. We have accepted the award and shall carry out its provisions faithfully. This company always has stood for and will continue to stand for arbitration, regardless of whether the outcome in any particular instance favors one side or the other.

WHAT THE RESULT SHOULD BE

The men have been given substantially everything that they asked for—and far more than they expected.

This removes all possibility of complaint on the part of the men that they are not being fairly treated by the company, or that they are not getting a fair share and more than a fair share of the joint product of labor and capital.

There should be, and there will be, a better feeling on the part of the men toward both the public and the company. This ought to bring about, among other things, better service to the public.

WHERE THE PUBLIC COMES IN

Four-fifths of the complaints received by the company have to do with the treatment of the public by our employees—complaints involving the personal equation—such as discourtesy, running by passengers, starting too quickly, not waiting for passengers at transfer points, etc.

Every complaint of this nature should now be eliminated. We shall appeal to every man in the train service to co-operate with the management in every way possible to give a better service than ever before, and particularly to be mindful at all times to extend to our passengers every courtesy and consideration to which they are entitled. We believe that the great majority of our men will respond loyally to this appeal.

THE PUBLIC MUST HELP

We ask the public to keep us advised constantly of the kind of treatment they are receiving from our employees.

A part of the service for which the public pays is courtesy and consideration on the part of the trainmen. These are just as essential to good service as keeping the cars on regular schedule.

We therefore ask the public to help us improve the service along these lines—first by calling our attention to acts of courtesy or consideration for the welfare of passengers which they consider worthy of mention; and, second, by calling our attention to every act of discourtesy or lack of consideration.

If the public will co-operate with us fully in this regard, we will undertake to see that credit is given where credit is due and that all complaints are investigated promptly and the proper remedies applied.

EFFECT ON OTHER CHICAGO LINES

It has been decided that the award to the employees of the surface lines will not affect the negotiations between the Elevated Railways of Chicago and its employees. By a separate agreement this company consented to arbitrate all disputed questions with its employees and that Mayor Thompson should act as umpire. Negotiations to eliminate some of the minor problems are being conducted by President Britton I. Budd and the union officials. Mayor Thompson will not return from a trip to the Coast until early in August, hence it will be at least until that time before actual arbitration hearings can be conducted. In the meantime the company is collecting data, but as yet neither it nor the employees have announced the names of their representatives on the board of arbitration. Practically all the questions which were submitted to the surface lines' board will be taken up in the arbitration of the elevated railways' difficulties, but in addi-

tion to these many other classes of employees are involved, therefore the evidence to be presented will be more complicated.

By prior agreement the Chicago & West Towns Railway will accept the award granted the employees of the Chicago Surface Lines in so far as it affects the question of wages and the term of contract. In this agreement working conditions were considered as a local problem and will be disposed of this week in a conference between General Manager F. L. Butler and representatives of the employees. Approximately 230 employees will be affected.

The Evanston Railway Company, Evanston, Ill., also by prior agreement with the employees, is bound to accept the Chicago Surface Lines' arbitration award in so far as wages and term of contract are concerned. The working conditions in this case were also considered a local problem and will be negotiated as quickly as possible. Forty-five employees will be affected.

Advertising Car in Boston

For the purpose of stimulating traffic during the summer months the Boston Elevated Company is conducting an interesting publicity campaign that includes some original ideas. The most unusual feature is a single-truck car on each side of which are carried three large oil paintings more than 6 ft. square that are both striking and artistic.

These paintings advertise points of interest in the vicinity of Boston reached by lines of the Elevated Railway Company and connecting companies. The pic-

among other attractions three performing elephants that were purchased by Boston's school children and given to the city. These have been used for the subject in the picture advertising that resort. Norumbega Park on the Charles River is represented by a young couple paddling a canoe, together with a circular insert showing a brightly costumed dancer in the spotlight on the stage of the open-air theater.

Two children playing in the sand on the beach at Marine Park, South Boston, is the principle subject of another painting, in which there is inserted a striking picture showing the brilliantly hued tropical fish that are exhibited at the aquarium included in this park. Another picture advertises Lexington Park and shows a young couple dancing in the pavilion and contains in one corner a picture of the head of a buffalo of the zoo. On each side of the car in the central square is a large map showing points of interest that may be conveniently reached by short trolley trips and indicating the route and connection by small lines in the usual style of map drawings.

The car is illuminated by a row of overhead lights at night and although put in operation for the first time Tuesday, July 13, has already attracted a great deal of attention and resulted in extensive newspaper notices.

Besides the advertising car the company is publishing a series of small 1-in. single-column display advertisements on the front page of the Boston daily papers. These advertisements are run every Sunday and every other day on week days in each of the papers. They call attention to places of interest in short, pithy sentences in simple, direct language.

Animals, Birds and Fishes

Interesting collection of birds and animals may be found at Franklin Park, Norumbega Park, Lexington Park and Middlesex Fells. A remarkable collection of brilliant hued fish may be found at the Marine Park Aquarium. These are all delightful places for spending a summer afternoon or evening.

CHILDREN'S OUTINGS

Take the children to see the animals and birds at Franklin Park, Norumbega Park and Lexington Park and the fishes at Marine Park. These parks are beautiful, cool and safe for children.

GO TO THE WOODS

There are many beautiful tracts of woodland within a few miles of Boston famous for their charm, including Middlesex Fells, Stony Brook Reservation, Norumbega Park, Blue Hills, Dorchester Park and Lexington Park.

TYPICAL CARDS CARRIED IN BOSTON DAILY PAPERS

tures are done in poster style by Fred C. Sanborn, a well-known decorative artist of Boston, and are of a higher order of artistic excellence than is ordinarily found in advertising paintings. Out-of-door life and attractions, that make a strong appeal to most people during the summer months, furnish the theme for each of the paintings, and the work has been done with a few strong, harmonious colors that produce a highly decorative effect and compel attention.

Franklin Park, a city-owned recreation park, contains

The company is also using large 5-ft. x 7-ft. printed posters mounted upon upward of 150 billboards owned by the company on different parts of the system. These posters enumerate various points of interest on the company's and connecting lines and announce the attractions to be found at each place. The posters are changed monthly.

The newspaper and billboard advertising campaign was begun about June 1 and will be continued during the months of extensive pleasure riding.

ADVERTISING CAR USED IN BOSTON TO STIMULATE SUMMER TRAFFIC

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Director of Transportation McConaughy Gives Further Details Regarding Convention Trains — Manila Company Section Meeting—T. & T. Association Committee Discusses Uniform Definitions

CONVENTION TRAINS

In connection with the distribution of detailed information regarding the Red and Blue Specials (tour trains) and the White Special (one-way train) which will be given in circulars to be mailed on July 26, H. G. McConaughy, director of transportation, calls attention to the following points:

Each special is limited as to the number of passengers, consequently it is most important for those who intend joining any of the tours to make their reservations immediately upon receipt of the itineraries. The requests already received from railway officials assure the success of the convention. The fact that arrangements have been made in cities en route for meetings with officials of the local railway companies makes this an exceptional opportunity for Railway Association publicity and gives the manufacturer and his representatives an opportunity of making new friends and renewing old acquaintanceships.

The members of the Railway Association and those of the Manufacturers' Association should keep in mind that this is the first opportunity that these associations have had to visit, as associations, the member companies in the Far West.

The transportation committee hopes that the railway officials and manufacturers will divide the men whom they contemplate sending between the Red and the Blue special trains, and that the members of both associations will take their families with them. Special arrangements have been made for the comfort and convenience of ladies and children. For the convenience of the members hotel accommodations en route (but not including San Francisco) have been provided for and the cost included in the prices of the tours.

Members and guests living in cities and towns not shown in the itineraries can make transportation arrangements from and to their home towns on any of the tours.

Information regarding costs or routing can be obtained by addressing the director of transportation, Suite 1002, 165 Broadway, New York City.

MANILA COMPANY SECTION

The regular meeting of the joint A. E. R. A. and N. E. L. A. company section No. 5 was held in Manila on June 1.

W. A. Seten of the electrical department presented a paper entitled "How to Increase the Sale of Electric Appliances, or Getting Business for the Electric Department," and W. D. Calfee, night carhouse foreman, presented one on "Personal Efficiency." After the discussion of the papers, C. N. Duffy, vice-president Manila Electric Railroad & Light Company, announced that the company will award substantial cash prizes for the best three papers read before the company section during the calendar year 1915, under conditions to be determined by the section. Company officials and managers of departments are not eligible to compete. The secretary, W. A. Smith, announced the program for the July meeting, consisting of papers on "How a Claim Agent Earns His Salary," "The Electric Motor vs. All Comers," and "The Necessity of Shouldering Your Own Responsibility." The names of several leaders in the discussion of each paper were also announced.

In his paper Mr. Calfee first quoted Harrington Emerson's definition of personal efficiency as "the mental and physical ability to find and take the best, easiest and quickest way to the desirable things of life." He then proceeded to apply this to the practical work of the railway man, stating that exact knowledge, guesswork and efficiency will not pull together. "Precision," said he, "is impossible without prevision." The railway man should get the best papers and magazines on his particular business and see what is being done elsewhere, whether his own practice is up to standard or not. The personal efficiency of an individual is affected by his environment, his aptitude and his mental attitude. When men realize that efficiency never has to go begging for advancement, and that the man who masters his trade goes to the top, we will see more efficient men. Personal efficiency is also personal independence. Mr. Calfee's paper illustrated the principle of efficiency and it brought out a lively discussion.

T. & T. ASSOCIATION COMMITTEE ON UNIFORM DEFINITIONS

A meeting of the committee to develop uniform definitions of the American Electric Railway Transportation & Traffic Association was held in New York on July 13. Further consideration was given to the definitions in pursuance of the plans made at the meeting on June 25. H. C. Donecker, the chairman, and William C. Greenough were present. Additional work on the definitions will be done by the members of the committee by correspondence.

Pamphlet Issued by Secretaries' Society

The Society of Technical Associations' Secretaries, to the formation of which reference was made in earlier issues of the ELECTRIC RAILWAY JOURNAL, has issued a pamphlet containing the proceedings of the meeting held in New York on Feb. 27, 1915. Membership in this society is open only to individual secretaries of technical associations, but for all practical purposes the result is the same as if the associations were members, with the advantage that official action is not necessary in connection with the deliberations of the society. Harry D. Vought, secretary New York Railroad Club, is president; F. L. Bishop, secretary Society for the Promotion of Engineering Education, is first vice-president; Charles W. Hunt, secretary American Society of Civil Engineers, is second vice-president, and Bradley Stoughton, secretary American Institute of Mining Engineers, 33 West Thirty-ninth Street, New York, is secretary. The names of E. B. Burritt, secretary American Electric Railway Association; F. L. Hutchinson, secretary American Institute of Electrical Engineers; C. W. Rice, secretary American Society Mechanical Engineers, and Edgar Marburg, secretary American Society for Testing Materials, appear in the list of twenty-three charter members.

The Leuk-Leukerbad electric railway in Switzerland was put in operation on July 3. It is 6½ miles in length and construction was begun in 1912. The road cost \$600,000 to build.

COMMUNICATION

The Jitney vs. the Trolley

SARANAC LAKE, N. Y., July 7, 1915.

To the Editors:

James E. Hewes' paper "Jitney Bus Competition," an abstract of which appeared in your July 3 issue, will without doubt be taken by the jitney interests as sure proof that the bus is a cheaper method of city transportation than the trolley car. However, cost of operation per car-mile is not the only factor to be considered. Earning capacity is one of as great if not greater importance. Otherwise the Ford jitney would surely drive out the trolley and would as surely be driven out in turn by the jitney motorcycle or side car.

Even assuming Mr. Hewes' figure of 21.8 cents per bus-mile and his sixty-seat trolley car that operates at 27.3 cents per car-mile, including taxes and fixed charges (the average figure for the United States as obtained from the last census report) it can be shown that the bus is the more expensive to operate. Let N represent the number of car-miles operated on the system per hour for eighteen hours daily and three hours for the rush period when all the seats of the car will be required. Then for three hours a day the bus will have to operate three times as many car-miles as the trolley, due to its small seating capacity of twenty-two. For the whole day the bus operating charges in cents will be $21.8(60/22 \times 3N + 15N) = 505N$. For the trolley the costs will be $27.3 \times 18N = 492N$, which gives the trolley a saving of $13N$ cents a day. If during the rush period more car-miles an hour are run, as is usually the case, or if for more than three hours at least 37 per cent of the seating capacity of the trolley is used, then the saving will be still more marked, as I have used figures that give the bus every advantage.

As is so often the case, London has been cited as an illustration of the profitable operation of buses. Referring to the *ELECTRIC RAILWAY JOURNAL* for May 8, page 869, we find actual working figures as given by three British municipalities 32 cents, 25.4 cents and 28.8 cents per bus-mile. "Authentic figures lower than this are not available. The London bus company refuses to give its costs because of competition." These figures would not seem to indicate that bus operation in England was as profitable as supposed, although London, because of its narrow and congested streets, offers an exceptional field for the bus.

The estimate of 21.8 cents per bus-mile, as given in Mr. Hewes' paper, seems low in the light of English experience. Taking the figures given in the article on cost of bus operation in the *ELECTRIC RAILWAY JOURNAL* for Feb. 27, page 414, and changing them to conform with values given by Mr. Hewes for first cost of bus and for cost of gasoline, there is obtained an average of 24.9 cents per bus-mile for nineteen companies. Accordingly 21.8 cents per bus-mile seems very optimistic.

Likewise in taking \$35,200 as the cost of a trolley car ready to run a high figure has been used, except for interurban service. In the case of Massachusetts, where the percentage of interurbans is low, and where capitalization represents actual costs because of regulation, there appears a total cost of construction and real estate of \$194,677,690 for 7208 cars equipped with motors ready to run. This gives a cost of \$27,000 per car.

In the light of these facts the 5-cent motor-bus companies should have some difficulty in proving their case of more economical operation than the trolley. And since the several recent failures of motor-bus companies capital ought to require more than guess-work figures before investing.

F. DEWEY EVERETT.

Newark Terminal Cornerstone Laying

On July 20 the cornerstone of the \$5,000,000 terminal, which is under erection in Newark for the Public Service Corporation of New Jersey, was laid by President Thomas N. McCarter with appropriate ceremonies in the presence of a distinguished audience. The plan of this terminal was fully described in the issue of the *ELECTRIC RAILWAY JOURNAL* for Nov. 28, 1914, page 1190, and an illustrated progress report was given on page 793 of the issue for April 24, 1915. After depositing a dash of mortar with a silver trowel and rapping the great stone with a mason's mallet Mr. McCarter said: "I have truly laid the cornerstone of this building which, when completed, it is hoped will serve this community and others for years to come." Music for the occasion was furnished by a large band of trainmen of the Essex division of the Public Service Railway.

After the exercises at the building site the 200 or more guests were served with luncheon at a near-by restaurant and brief addresses were made by Mr. McCarter, Mayor Raymond, Senator Austen Colgate, ex-Senator James Smith and ex-Governor Franklin Murphy. At the luncheon were also other prominent public men and financiers, making a remarkable local civic gathering.

Portable Car Testing Set

BY D. D. EWING, ASSISTANT PROFESSOR OF ELECTRICAL
ENGINEERING, PURDUE UNIVERSITY

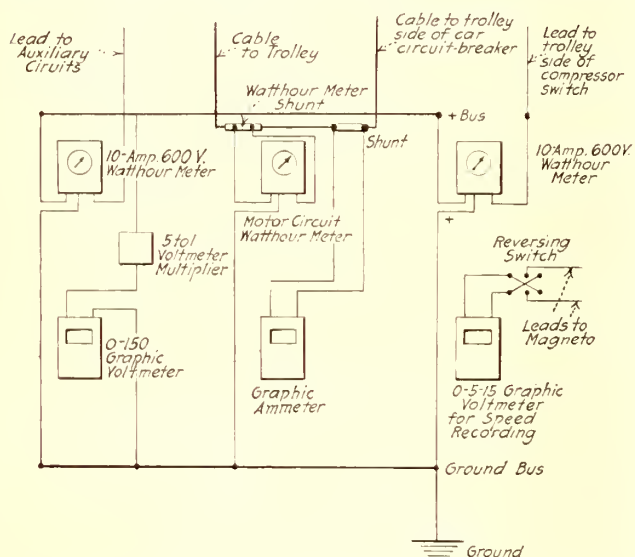

A convenient and compact car-testing set has been used at Purdue University in making a number of tests on electric cars within the last couple of years. This set, which was designed for compactness, portability and convenience of connection, consists of three graphic recording instruments and three watt-hour meters mounted on a suitable test stand. The wiring, a simplified diagram of which is given below, is placed on the back of the board upon which are mounted the watt-

By means of flexible couplings the chart-driving rolls of all three meters can be mechanically coupled together thus insuring synchronous chart movements. The ammeter is provided with several shunts, that shunt being selected for a given test which will give on the car starting current an indication over about three-fourths of the meter scale.

The magneto generator which forms part of the speed-recording apparatus is of the low voltage d.c. type. It is mounted on the truck and is chain-driven from a sprocket wheel mounted on an extension of one of the car axles. This method of magneto drive has proved successful for car speeds as high as 70 m.p.h. The speed-recording apparatus is also quite accurate. During tests the accuracy is occasionally checked by timing the distance between mile-posts with a stop watch. In all of the tests that have been made so far the two methods have given results that have agreed very closely.

Sangamo railway-type watt-hour meters with special reset dials are used. These dials have a high large-hand speed and the large hand may be reset at the end of each run without interfering with the small-hand dial records. The meter which is used to measure the energy input to the motor circuit is provided with several shunts, the shunt used in a given test depending on the capacity of the electrical equipment of the car under test. As shown in the wiring diagram, one of the 10-amp meters is used to measure the input to the air-compressor motor and the other the input to the remaining auxiliary circuits. Obviously the meter connected in the compressor circuit might be used to measure the energy input to any other auxiliary circuit.

Data taken with this set enable accurate conclusions to be drawn relative to the adequacy and efficiency of the electrical equipment of the cars and distribution system of an electric railway.

CAR-TESTING SET—DIAGRAM OF CONNECTIONS FOR METERS
AND SWITCHES

hour meters. The graphic meters are mounted on a spring-suspended shelf. Felt pads are fastened to the bottoms of the stand legs to further minimize vibration. The stand is of such size that it may readily be placed in the baggage compartment of an interurban passenger car, thus permitting tests to be made on the car while it is operating in regular service. When used in testing city cars, a section of the car in which the stand is placed is blocked off to prevent passengers from getting in the way of the test crew and to keep them away from the live circuits.

Esterline graphic meters are used. One graphic voltmeter is used to measure the voltage between trolley and ground, and another, in connection with a magneto generator, is used to measure the speed of the car. As usually connected the graphic ammeter measures the motor-circuit current only, although the connections can easily be arranged so that it measures the total car current. By means of a system of change gears in the chart drive, ten chart speeds, ranging from $\frac{3}{4}$ in. per hour to 12 in. per minute can be secured. While the timing with the higher speeds is not at all accurate these speeds are of particular value in studying "notching up" operations and starting-resistance adjustments.

An Inexpensive Method of Treating Boiler Feed Water

BY T. R. CRUMLEY, SUPERINTENDENT OF MOTIVE POWER
EVANSVILLE RAILWAYS

The Hatfield power house, which furnishes a part of the power used by the Evansville Railways, is equipped with a barometric type of condenser, an open type of feed-water heater and two 400-hp. Babcock & Wilcox water-tube boilers. The water for condensing purposes was originally secured from a small stream, but several months ago it became necessary to abandon this stream and to drive wells in order to secure an adequate supply of condensing water. Due to an increase in the station load, the feed-water heater became too small and it was possible to heat the boiler feed water to a temperature of only 170 deg. Fahr. A part of the exhaust steam entering the heater was not condensed.

Soon after the wells were placed in operation trouble was experienced from an excessive amount of scale deposited in the boilers. A chemical analysis of the water was made in order to determine the kinds and amounts of scale-forming impurities contained, and the amounts

and kinds of chemical reagents required to precipitate these impurities before the water entered the boilers. This analysis proved that the water was very hard, the principal impurities being the carbonates and sulphates of magnesium and lime. It was further determined that the necessary amounts of chemical reagents required to soften the water were as follows: 1.56 lb. hydrated lime per 1000 gal., and 0.2 lb. soda ash per 1000 gal.

As it was not considered advisable to install an expensive softening plant at this time, it was decided to build a tank in which to treat the water used for boiler purposes. This tank, shown in the accompanying diagram, was built of tongued-and-grooved cypress 2 in. thick. It is 14 ft. long, 6 ft. wide and 6 ft. deep. In order to utilize the surplus exhaust steam not condensed in the hot-water treater, it was also decided to build a small auxiliary heater, also shown in the diagram. This auxiliary heater serves the double purpose of increasing the temperature of the water at the time it receives chemical treatment, thereby making the treatment much more effective, and also raising the final temperature of the water entering the boilers.

The auxiliary heater was constructed of 1/4-in. x 2-in. x 2-in. angle iron and No. 12 gage galvanized sheet iron. The surplus steam from the main heater enters at the bottom of the auxiliary heater and circulates through and around perforated, removable trays. The water from the hot well is pumped by means of a small tank pump into the top of the auxiliary heater, where it is distributed over and filters through the perforated

HOME-MADE PLANT FOR TREATING BOILER FEED WATER

trays, thereby coming in contact with the steam. The water leaves the auxiliary heater at a temperature of 170 deg. Fahr., and falls by gravity into the treating tank. It is first caused to filter through a chamber packed with coke from which it passes into the main section of the tank. This chamber has a capacity equivalent to a two-hour supply for the boilers, so that the water is circulating very slowly at this point and time is secured to allow complete precipitation to take place. The water passes from this settling chamber through two small chambers packed with excelsior which catches the precipitated particles still suspended in the water. The water then falls by gravity into the main heater, where it is heated to a temperature of 205 deg. Fahr.

The soda ash is fed into the water as it enters the small tank pump, which pumps it into the auxiliary heater, and the lime is fed at the point where the water leaves the auxiliary heater. Both chemicals are fed by means of small pumps connected to the valve stem rocker arms of the boiler-feed pumps, so that the amount of chemicals used is proportioned to the amount of water fed into the boilers.

The work of building the treating tank, auxiliary

heater and chemical pumps was done by C. O. Maxwell, chief engineer, at a cost of approximately \$160. The temperature of the water entering the boilers has been raised from 170 deg. Fahr. to 205 deg. Fahr., which represents a saving of 3 1/2 per cent in fuel. A much greater saving has been effected, due to the decreased maintenance of pumps, piping and boilers. This treatment has almost eliminated the scale formed in boilers and is costing us less than 1 cent per 1000 gal.

Bearing-Babbitting Furnace

BY J. C. DONOVAN, MASTER MECHANIC UNION ELECTRIC COMPANY, DUBUQUE, IOWA

A gas bearing-babbitting furnace which has proved particularly valuable in reducing the costs of first quality bearings is being used in the shops of the Union Electric Company, of Dubuque, Ia. As shown in the accompanying illustration, the furnace consists of two parts. The upper surrounding shield contains a cylindrical burner over which old bearings are set to melt the babbitt. The melted babbitt falls into the lower

DUBUQUE RAILWAY—BEARING-BABBITTING FURNACE

pot, which is heated by a circular gas burner. The usual method of pouring the babbitt into the bearing mold is followed.

As is also shown in the illustration, air and gas are fed through mixers to each burner, insuring a quick, hot flame. The hot flame in direct contact with the babbitt metal in the old bearing consumes all combustible foreign matter and insures that only clean babbitt falls into the melting pot below. In addition to the foregoing advantage the hot flame insures a minimum loss in babbitt through oxidation.

The Union Railway, which operates street surface cars in the Bronx, New York City, has notified the Public Service Commission for the First District that it has completed the standardization of bumpers on its cars. The improvement was made at the request of the commission after a collision on the 149th Street line in September, 1914, when some persons were injured. The seriousness of the accident was due to a difference in the height of the bumpers on each car, permitting one car to crush the dashboard of the other.

A New Type of Catenary Hanger

BY W. H. CREVISTON, ILLINOIS TRACTION SYSTEM

Recently the Illinois Traction System tested a new type of catenary trolley hanger invented by C. H. Robertson, one of the oldest motormen on this road. The claim is made that this hanger, which is shown in

SAFETY TROLLEY
HANGER

one of the accompanying illustrations, will catch or lock the broken ends of the trolley wire to the messenger. This prevents the rest of the hangers from sliding along the messenger, a condition which frequently results in wrenching the mast-arms from the poles or in tearing down the trolley-wire suspension. As shown in one of the illustrations, the top of the hanger is an arc with teeth which grip the messenger when the angle of the hanger is changed from the vertical. The trolley ear is pivoted to the hanger, thus when the wire breaks the hanger swings from the vertical position and brings the clamp into play.

Where an ear is not pivoted to the hanger it is held in a vertical position, and a strain on the trolley wire slips the hangers along the messenger.

The halftone illustrations show a test made on one of the lines of the railway. In this test the trolley wire was cut at an ascending grade in the track so that the pull on the wire would be greater than that exerted by the weight of the wire only. Approximately $\frac{1}{2}$ mile of five-point catenary construction was equipped with the new type of hangers and the trolley wire was cut between the third and fourth hangers between mast-arms. As will be noted in one of the halftone illustrations, when the ends of the trolley wire were again raised approximately to their original position, they were only about 12 in. apart. In another of the illustrations the cut wire is shown swinging, while the trolley beyond the first two hangers each side of the cut is approximately at normal position. In other words, the first hanger on each side of the break took practically all of the strain, while the second hangers beyond were found

SAFETY TROLLEY HANGER—BROKEN TROLLEY WIRE HELD IN ORIGINAL POSITION

to be very little, if any, out of their normal position. Aside from the effect of the hangers retaining about their normal position on the messenger, the swinging position of the trolley wire is such as to eliminate a ground and also permits trains to operate under the break. Line repairs may also be easily made since there is no damage to the rest of the catenary construction, and the ends of the broken wire when restored to their normal position are only a short distance apart. These clinch hangers are manufactured by McConkie & Robertson of Peoria, Ill.

Novel Contact Rail Installation in England

There will shortly be placed in commission on the division between Manchester and Bury, Lancashire & Yorkshire Railway, a novel form of 1200-volt third-rail contact system which is the invention of the general manager of the company, J. A. F. Aspinall of Liverpool. The distance between Manchester and Bury is $9\frac{1}{2}$ miles. A reference to this installation, noted on page 62 of the issue of the ELECTRIC RAILWAY JOURNAL for July 10, was made by H. M. Hobart in connection with the discussion of contact systems at the recent Deer Park convention of the American Institute of Electrical Engineers.

The essential features of the invention are clearly shown in the accompanying illustrations, the most novel

SAFETY TROLLEY HANGER—CUT TROLLEY WIRE HELD BY HANGER

NOVEL CONTACT RAIL SYSTEM—ASPINALL PROTECTED THIRD-RAIL, MANCHESTER & BURY RAILWAY

ones having to do with the side bearing of the contact device upon the rail and the method of surrounding the rail with wood guards.

Referring to the cross-sectional view, which shows the preferred form of contact rail, it will be noted that a channel form of rail is used with a head sufficiently thick to provide a wide contact surface on the side. The form of rail was selected to provide a low center of gravity to prevent overturning even when the rail is not fastened down. While any form of rail can be used, this one is also well adapted to inclosing with protecting wood guards.

The contact rail is set upon insulators provided with lugs to prevent lateral movement. It is almost entirely inclosed with boards of Australian Karri timber which cannot be set on fire. The only openings around the rail are a slot at one side of the cover for the accommodation of the current collector, and drainage holes, as *G*, are provided to prevent accumulation of water in the groove formed between the guard and the collector rail. There is not a nail or bolt anywhere in the protecting guards.

The angle-shaped guard, *B* in the illustration, rests directly against the rail surface, but the invention covers insulation therefrom if such be found necessary. The guard on the slot side is spaced away from the rail by means of a wooden filler block, termed by Mr. Aspinall a packing or distance piece. Over the rail base is a bent metal distance piece, *F*, secured in place as shown. The guards are attached to the collector rails without bolts by means of detachable metal clamps, *D*, placed between insulators. In connection with these are used wooden keys, *E*, preferably similar to those used in fastening the running rails in their chairs. In the diagram one of the running rails is shown at *H*,

NOVEL CONTACT RAIL SYSTEM—FORM OF SHOE FOR ASPINALL PROTECTED THIRD-RAIL

with the wedge holding it in its chair. The relation of the running and conductor rails, in regard to heights and spacing, are incidentally brought out in this figure.

The contact device, which with its mounting is shown in the accompanying halftones, is hinged and is pressed against the contact rail by means of a coiled spring. The method of mounting upon an insulating support is clearly shown. The halftones also show details of the protected rail with approaches, and an unprotected fourth-rail used for the return, as in standard British practice.

The advantages of this novel construction over the usual one appear to be that very complete protection can be furnished and provision can easily be made for considerable vertical variations in the relative positions of rail and collector. Under the climatic conditions found in England difficulties with sleet ac-

NOVEL CONTACT RAIL SYSTEM—CROSS-SECTIONS OF PROTECTED THIRD-RAIL, "A," AND RUNNING RAIL, "H"

NOVEL CONTACT RAIL SYSTEM—ASPINALL PROTECTED THIRD-RAIL WITH ENTERING RAMP FOR SHOE AND THE RETURN FOURTH-RAIL CONSISTING OF A PLAIN RECTANGULAR BAR

cumulations are not anticipated. The simplicity of the construction is such that the ordinary trackman or "plate layer" can keep the contact rail in order, with the exception of the bonding.

The Lancashire & Yorkshire Railway was the earliest main line in England to be electrified. Third-rail, with 600 volts, was used on the original installation between Liverpool and Southport where a very heavy service was operated. The average distance between stops is 1.32 miles and the schedule speed 30 m.p.h. This section has been operated electrically for many years. Mr. Aspinall has long been interested in the employment of higher voltages and in 1913 put into operation an experimental 4-mile, 3500-volt, d.c. line with overhead conductor, between Bury and Holcombe Brook. The operation was satisfactory but problems connected with tunnels and bridges prevented the extension of the experimental line and the 1200-volt third-rail was selected for the present electrification. These facts are mentioned to indicate that the chosen construction was adopted after long experience with electrical operation under local conditions.

Inexpensive Drinking-Fountain Guard

In the new shop of the Holyoke (Mass.) Street Railway a sanitary drinking fountain is located in the repair shop between doors leading into the stockroom and the forge department. To guard the "bubbler" from injury in the handling of material, two $\frac{3}{8}$ -in. x 2-in. straps of wrought iron have been installed, as shown

DRINKING FOUNTAIN GUARD AT HOLYOKE (MASS.) STREET RAILWAY SHOPS

in the accompanying illustration. The straps are $6\frac{1}{2}$ in. apart on centers, which gives ample room for manipulating the spring valve controlling the fountain. They are bolted through the shop wall and protect the piping as well as the fountain, besides safeguarding the clothing of the men passing through the busy aisle in which the fountain is located.

Paste Filler for Commutator Slots

Commutator life on the lines of the Indianapolis & Cincinnati Traction Company has been materially increased by applying an insulating-paste filler in the commutator slots of the single-phase motors the company uses. Before a motor is returned to service and after it has undergone repairs the grooves between the commutator segments made by the slotting machine are filled with a mixture of dental plaster of paris and hard-

cooked starch in parts one-half each by weight. This is made into a paste by adding gum shellac and stirring to a uniform consistency, after which it is spread over the commutator bars, particular attention being given to fill the slots. Experience of the last four years has shown that this paste filler prevents carbon and copper dust from collecting in the slots. The paste is a fair insulator, hence eliminates the destruction of the edges of the commutator bars caused by arcing, a condition which occurs after a motor has long been in service and copper dust has collected in the slots.

Improvements in Des Moines Interurban Cars

Recent improvement in the cars of the Inter-Urban Railway Company of Des Moines, Iowa, have done much to eliminate difficulties experienced in the past. Perhaps the most important of these, made principally for the comfort of patrons, is the provision of a separate baggage compartment. In the past the baggage and express was loaded in the smoking compartment. When baggage shipments were heavy this entailed discomfort to the passengers, and at the same time the baggage and express matter was under the control of no one. This was also true of mail bags which were transported in this compartment. When the full capacity of the baggage compartment was not required, folding seats which were placed along the sides of the car were lowered for the use of passengers. When baggage and express

VIEW OF DES MOINES INTERURBAN CAR, SHOWING AIR-OPERATED LOCOMOTIVE BELL

haulage was heavy these seats were not available and passengers were required to stand or to use the baggage for seats.

The Inter-Urban Railway passenger cars are 54 ft. 5 in. in length. A space 23 ft. 9 in. long serves as the main passenger compartment, and on the original cars the baggage and smoking compartment was 13 ft. 10 in. long. In the remodeled car the main compartment has been maintained at approximately the same length, while 8 ft. $\frac{1}{2}$ in. has been allotted to the baggage and 8 ft. 2 in. to the smoking compartment. The extra length was obtained by eliminating the motorman's compartment, the front end of the car serving as a cab as well as a baggage compartment. By this arrangement baggage, express matter and mail is put under the control of the motorman.

The electrical equipment of these cars includes GE-73-C motors with a 2.12 to 1 gear ratio obtained by

using a twenty-four-tooth pinion and a fifty-one-tooth gear. These motors are rated at 55 m.p.h. at 600 volts and they are controlled through GE Type M control. To make the removal of dust which collected on the reversers and contactors of this equipment an easy task, they were varnished with a mixture of orange shellac and oxalic acid. This provided a smooth, hard surface which was much more easily cleaned than the bare metal.

During the Iowa winters considerable trouble has been experienced with snow collecting in the contactor boxes. This was obviated by providing an asbestos-board bottom in the boxes with an opening across the end away from the motorman's position. This arrangement permitted the snow which collected in the contact boxes to be drawn from them by the air suction created when the car was in motion.

A setting and tripping switch in the motormen's cabs has been substituted for the relay. This has been found to be a more dependable device and furnishes better protection to the motors. Solid fingers on the reversers have been replaced by split fingers and more satisfactory results have been obtained. Also, a piece of fiber inserted between the forward and reverse segments has been found advantageous because it permits the fingers to slide more easily when the reverser is being used.

The laws of Iowa provide that a bell must be sounded continuously whenever a train passes a highway crossing. To conform to this meant to place a burden on the motorman, which this company believed diverted his attention from his other duties. In order to relieve him, all cars have been provided with air-operated standard locomotive bells. As shown in the accompanying illustration, these bells are mounted above the motorman's cab, and they weigh, complete with air ringer, approximately 29 lb. A rather interesting feature in connection with the bells is the use of windshields in front of them. This was found necessary to reduce the air pressure required to ring the bell, and it has also been found that the shield tends to diffuse the sound to better advantage.

Rear Wheel Fenders for New York Buses

Long wooden safety fenders have been hung beneath the bodies of all motor buses operated by the Fifth Avenue Coach Company, New York City. These are located on either side of the buses, between the front and rear wheels, and curve outward toward the rear, so that rear wheels of each vehicle are thoroughly protected. Oddly enough, the majority of accidents to pedestrians in the streets of both New York and London on account of the motor bus have been rear-wheel accidents. People have a way of waiting for the front wheels of the bus to pass them and then heedlessly walking into the path of the rear wheels. In New York all classes of bus accidents are surprisingly few, the record last year being on the basis of one pedestrian injured to more than 1,500,000 miles of service. This excellent showing is largely due to the fact that the company is exceedingly careful in the selection and training of its chauffeurs, so that avoidable accidents to pedestrians have been almost wholly eliminated. With the installation of the fenders it is believed that mishaps to persons in the streets will be practically a thing of the past. These fenders, it may be said, were provided on the company's own initiative, its safety record having been such that its equipment has never been unfavorably criticised by the public authorities. The new fender is of the same type as that recently adopted by the London bus company with successful results.

Oil Knife Switches

An extensive line of oil switches for voltages up to 7500 has recently been brought out by the Westinghouse Electric & Manufacturing Company. These are non-automatic and are suited for a wide range of application, being made for indoor service in switchboard-mounting, direct wall-mounting, and remote-control styles, and for outdoor service on poles or in subway.

The direct wall-mounting style is particularly adaptable to motor installations on account of the facility with which it may be mounted on any support convenient to the motor operator. The lever and handle extend outward over the oil tank so that the switch may readily be mounted against a wall, post or other vertical support. The remote-control wall or pipe-mounting style allows the switch to be mounted at a convenient point away from the switchboard and operated from the switchboard or other point.

The outdoor oil switch is particularly adapted for controlling lines entering buildings, branch feeders from the main lines, sectionalizing feeders, or any of the numerous purposes for which an outdoor type of switch

INDOOR TYPE OF OIL KNIFE SWITCH WITH TANK REMOVED, AND OUTDOOR SWITCH FOR POLE MOUNTING

may be utilized on distribution systems. The subway-type oil switch is for mounting in places where a switch may be required to be operated submerged. It is made with two, three or four poles, and either single or double throw, and is designed for voltages up to 4500 and capacities up to 200 amp.

Characteristic features of this type of switch are: Knife-blade contacts submerged in oil; live parts carried on insulating supports, affording a high quality of permanent insulation between adjacent poles and between the frame and live parts; small space required for mounting; accessibility of parts for purpose of inspection and repair; inclosure of all live metal parts, and low first cost. Knife-blade contacts are used because they insure the best contact for low temperature rise in a non-automatic switch. Each contact jaw has attached to it an arcing piece which takes the final break, thus preventing any burning of jaws. These arcing pieces are inexpensive and readily replaced when worn or burnt away.

With the exception of the 1500-volt switches, the contacts are mounted on all-porcelain insulation. In switches for 7500 volts and above the insulation is of the pillar porcelain type, similar to that of the best accepted standard form of circuit-breaker construction. In the 4500-volt type up to 200 amp. the contacts are mounted on a sturdy horizontal porcelain base, with molded porcelain barriers between all live parts. In general this form of construction gives these switches the same characteristics ordinarily looked for only in the highest grades of oil circuit-breaker construction, but these are obtained at a more moderate price than could apply to the non-automatic form of oil circuit-breaker.

Prepayment Car Apparatus

Since the United States Circuit Court of Appeals for the Second Circuit rendered an adverse decision on certain patents of the Prepayment Car Sales Company and the Supreme Court of the United States declined to review this decision, there has been considerable interest about the future plans of the company. An announcement on this point has now been made by Thomas W. Casey, president of the Prepayment Car Sales Company. According to Mr. Casey, while this decision was unfavorable, it was on two patents only and in one district only. The company believes these patents still valid, and it is expecting to have them adjudicated in other districts.

The Prepayment Car Sales Company will make certain changes in its organization, and in future will devote itself to the patent features of its business only, and after Sept. 1 the manufacture and sale of door and step operating mechanism will be carried on by the National Pneumatic Company.

The company's business began, of course, with the development of the "pay-as-you-enter" car in Montreal some ten years ago. The idea was introduced in the United States shortly after. At first it met with considerable opposition but soon proved very popular. Later, other patents were secured, notably those of the Pay-Within Car Company and rights for prepayment cars under the door and step mechanism patents of the National Pneumatic Company. During late years, therefore, the company's business has consisted in the issue of licenses to use its basic patents covering the location arranged for the conductor in relation to the entry and exit of passengers and also in the sale of mechanism for controlling the operation of the doors and steps, etc.

According to Mr. Casey, the only patents so far litigated have been those covering the location arranged for the conductor in relation to the entry and exit of passengers. The many advantages of the prepayment car have been evidenced by its almost universal adoption in one form or another, and while many companies feel that the electric railway industry owes a heavy debt to those who originated and introduced the idea, whether the basic patents will stand all the tests of legal validity or not, in justice to all, it will be the policy of the company not to accept royalties under these patents on any cars hereinafter put in service until the basic patents have been finally declared valid. In the meantime the mechanism, which has heretofore been manufactured for the Prepayment Car Sales Company by the National Pneumatic Company will be sold direct by the National Pneumatic Company for prepayment cars of all types, just as that company has sold mechanism in the past for elevated, subway and interurban cars. While the company has no right to guarantee against the basic prepayment patents which are still owned by the Prepayment Car Sales Company, its customers will be on the same basis, so far as this fact is concerned, as customers of competitors.

The National Pneumatic Company is well known as manufacturer of pneumatic door devices used so largely on subway, elevated and interurban railways, as well as manual door and step operating mechanism for electric railway cars, and it is said that the company is in a position to continue this work on a very large scale. The development of the prepayment car opened a new field for door mechanisms, and these will now be available on the conditions already described.

To carry out the new plan, which will be put in effect on Sept. 1, Mr. Casey will be elected a director and also vice-president and manager of sales of the National Pneumatic Company. Harold Rowntree will

continue as president of the company and P. R. Forman as general manager and engineer.

Ground-Wire Disconnecter

A new ground-wire disconnecter is being manufactured by the Electric Service Supplies Company, Philadelphia, Pa., which eliminates the element of danger to linemen involved by grounded connections on a pole line. It is well known that lightning disturbances, owing to their relatively high frequency, will not travel far along a line in order to reach a lightning arrester and so be dissipated to earth. It is, therefore, self-evident that in order to afford maximum protection to apparatus lightning arresters should be installed as close to the apparatus as possible. This has been advocated for years. With transformers it is usually done by installing arresters to protect every transformer, or to protect every transformer whose capacity is above a certain minimum, arresters being installed on the transformer

GROUND-WIRE DISCONNECTER IN CONNECTED AND DISCONNECTED POSITIONS

pole and grounded at this pole. In such cases the ground wire presents an element of danger for a lineman, who must, for example, climb the pole on a wet night to replace a blown transformer fuse, because he may accidentally cross himself with the lightning-arrester ground wire and with a live wire or live piece of apparatus.

To avoid this danger the Garton-Daniels ground-wire disconnecter has been designed. It consists of a brass casting that is screwed to the side of the pole. At the top a lug is provided into which a No. 4 or No. 6 solid wire running from the lightning arrester may be soldered. At the bottom another lug is provided into which a split brass plug slides. This plug is furnished with 12 in. of No. 6 flexible copper cable, the free end being soldered into a standard brass cap screwed to the end of the lightning-arrester ground pipe. With this method the ground pipe, as shown, is usually extended 8 ft. or 10 ft. up the pole to prevent the plug being withdrawn by any unauthorized person. A lineman who desires to work on the pole top for any reason simply pulls out the plug as he ascends, thereby disconnecting the upper wire and lightning arresters from ground, and so rendering work on the pole comparatively safe.

These ground-wire disconnectors are very useful where lightning arresters are tested by connecting them between opposite phase wires. The pulling of the plug disconnects the ground terminals of the arrester from earth, making unnecessary the removal of the ground wire from the ground binding post to prevent momentarily grounding one phase of the system while making the test.

News of Electric Railways

WILKES-BARRE ARBITRATORS REPORT FINDING

Employees Receive Increase of 9½ Per Cent—Sliding Scale Based on Profit Sharing Adopted for Two Years

The Wilkes-Barre board of arbitrators, Samuel D. Warrier for the Wilkes-Barre (Pa.) Railway, Thomas D. Shea for the Street Car Men's Union, and Dr. John Price Jackson of the State Department of Labor, as umpire, made public its findings on July 10. The previous history of this case was published in the *ELECTRIC RAILWAY JOURNAL* of April 10. Under the award the men have secured an increase in wages of about 9.5 per cent and a sliding scale based on a profit-sharing plan during the fiscal years of 1916 and 1917. If, instead of resorting to a strike last April to enforce impossible demands, the men had accepted the compromise offer of 26 cents per hour, they could have avoided the loss of nine days' work, besides the loss of revenue to the company and the inconvenience experienced by the general public. The award seems clearly to establish the fact that the claims of the company were fully sustained by the majority of the arbitration board.

The wages to be paid for a period of the three years beginning with Jan. 1, 1915, to motormen and conductors, in lieu of the present flat rate of 24 cents per hour, are to be: First-year men, 24 cents per hour; second-year men, 25 cents per hour; third-year men, 26 cents per hour; fourth-year men, 26½ cents per hour, and fifth-year men, 26¾ cents per hour. Moreover, the motormen and conductors are to participate in the increased passenger revenue received by the Wilkes-Barre Railway per car-hour in 1916 and 1917 in the following manner: The passenger revenue per car-hour for the fiscal year ended Dec. 31, 1914, which was \$2.78, is to be the basis. For each 2½ cents of passenger revenue per car-hour in excess of this basis received by the company during the current fiscal year, each motorman and conductor shall receive an additional compensation of one-fourth of 1 cent per hour for his services during the next fiscal year.

The arbitrators state that the wages paid to trolley employees in the region adjacent to Wilkes-Barre show many conflicting discrepancies. An effort was made to adjust the wages of the Wilkes-Barre Railway employees in such a manner as to take into consideration the averages of the wages paid to employees of other companies of the same class and operating under the same conditions, and to award a reasonable increase over and above these averages. The testimony regarding the increase in living conditions was of so conflicting a nature as to be of little value, but it is felt the proportional increase awarded fairly not only represents comparative conditions of labor, but also gives weight to the increased cost of living reasonably to be expected during the period of the present contract.

RAILROADS FILE MAIL PAY CLAIMS

New England Roads Seek to Recover from Government Large Losses Caused by Acts of Postal Department

Alleging that they have lost large sums through carrying the mails under the present system of weights and that their compensation at the present rate fixed per mile is unreasonable, unjust and confiscatory and hence unconstitutional and void, seven New England roads filed printed petitions on July 17 in the Court of Claims in Washington in an effort to obtain from the government the sums of money which they contend they have lost in the last six years by reason of the postmaster-general's alleged arbitrary mandates and the operation of the present system.

The roads filing these petitions and the amounts claimed from the government are as follows: New York, New Haven & Hartford, \$4,524,713; Boston & Maine, \$3,676,823; Maine Central, \$1,839,740; Bangor & Aroostook, \$490,194; New York, Ontario & Western, \$305,000; Sandy River & Rangeley Lakes, \$30,968, and Bridgeton & Saco River, \$13,425; total, \$10,880,865. This is an average annual loss of \$1,813,477 for the last six years.

The petitions filed by these New England railroads claim: (1) That the annual increase of mail has not been paid for at all; (2) that the carrying of the parcel post has been without adequate compensation, and (3) that the deficiency created by loss of mail compensation must be made up from the freight, passenger and express receipts. Two causes of action are set up in the petitions filed, one with respect to the system of quadrennial weighing, declared to be illegal, and the other with respect to the rate of pay per mile and the increasingly expensive demands made from time to time by the postmaster-general upon the railroads for facilities, for which no adequate compensation has been made.

With respect to the weighing of the mails every four years as a basis for the mail payments to them, the railroads assert that such weighing has been done exclusively by the post-office department and that they have been prohibited from fully inspecting and verifying such weighing. They repeatedly requested and demanded of the postmaster-general that the mails carried be weighed annually or that the weights be taken at the beginning and end of the four-year period and averaged, but such demands were "ignored and refused." With regard to the effect of the parcel post law on them, these railroads point out that the increased mail resulting from these packages has not been included in any weights ascertained by the department and no compensation has been paid them for it upon any basis of weight. Regarding the acts of the postmaster-general by which they allege that their burdens have been increased, the railroads allege that he has from time to time during the existence of outstanding quadrennial contracts made large additions thereto and increased requirements therein; he has made greater and more expensive demands for rooms and equipment for handling the mails and carrying them to post-offices, and he has made other illegal and onerous exactions.

SAFETY CONDITIONS IN BOSTON SUBWAYS

An Interesting Report Just Rendered to the Public Service Commission by William L. Puffer

In accordance with a vote of the Massachusetts Public Service Commission resulting from the accident to the electrical distribution system of the New York subway on Jan. 6, 1915, an investigation of the conditions of safety on the subway and rapid transit lines of the Boston Elevated Railway has been completed by William L. Puffer, consulting engineer, Boston, who has addressed an extended report to the board on the subject.

At the outset of his report the author states that early in his investigation he was informed by M. C. Brush, second vice-president, that a conference of officials was held immediately after the New York accident as to the possibility of a similar accident in the Boston subways and tunnels. As a result of the studies then made and also of certain suggestions made by Mr. Puffer during his examination a number of the recommendations in his report have been adopted and others are under advisement. In acknowledging this, Mr. Puffer says: "A report of this kind must necessarily appear critical and perhaps unfriendly because it cannot go into all details of the good things so self-evident in the service and equipment which continuously and safely transports thousands of passengers." After contrasting the conditions in New York and Boston, the report points out that in the latter city the liability of the system to derangement is diminished by the radial character of the service, the shorter distance between stations, and the fact that there are several power houses feeding energy toward the city from different directions, and generally over more than one route.

Regular inspections bearing upon the prompt elimination of combustible materials and rubbish are recommended, with the storage of such combustibles as may be absolutely necessary for operation at stated places where thorough automatic fire protection can be had. All permanent

construction should be fireproof, and combustible rubbish from construction or repair work removed at once.

The author commends the block signal installations in the Cambridge and Boylston Street subways and states that that of the Washington Street tunnel, while not the equal of the two former, was fully up to date at the time of its installation and able to give a fair degree of safety. The automatic train stop is used in these tunnels and is desirable. In place of the simple home signals used in the East Boston tunnel, Mr. Puffer recommends the installation of a system similar to that in the Boylston Street subway, extending through all stations from portal to portal. The report states that all of the apparatus relating to signals and train stops on the rapid transit lines appears to be of the best kind, well installed and carefully maintained.

The report recommends the reconstruction of the lighting distribution center at Boylston Street, in the Tremont Street subway, which contains three large transformers for the supply of emergency lighting in a large portion of the subways and tunnels of the city, the transformers being placed in an air-tight fireproof room with the exception of an outdoor smoke vent. Transformer oil drains and the inclosing of all high-voltage circuits in ducts are advised, with abandonment of the chamber as a workroom and storeroom, and the removal of all combustibles to a special room provided with automatic sprinklers or otherwise protected against fire.

The report recommends that efforts be made to devise a scheme whereby the third-rail can be provided with a suitable insulating and protecting cover. The author holds that the location of the bare third-rail about 19 in. to one side of and 6 in. above the running rail constitutes a dangerous obstruction in case of a hurried exit of a carload of passengers from a train, even assuming the tunnel lights were of full brilliancy. Experience at New York with the covered third-rail is cited as proof of its success, although the author realizes the difficulties of designing a covering and contact shoe suitable for all engineering and operating requirements. He believes it possible to lower the third-rail 2 in. and set it about 3 in. farther away from the running rail. Then the present walks if raised a few inches would become a very efficient cover for the rail and at the same time serve as a walkway. Should it be found too costly to provide a covering for the third-rail, the report recommends that all woodwork in the floors of all cars to be operated by third-rail power be replaced with non-combustible materials until such time as all-metal cars can be used. It also recommends that all third-rail section switches not now situated at stations be provided with remote-control from the same point or points where the switches are located for the sections adjacent to the stations.

In connection with the other conductors, the report emphasizes the undesirability of grouping lead-covered cables, on account of the susceptibility of such coverings to melting at relatively low temperature in case of breakdown. Such breakdowns are not serious when they occur in a properly constructed duct line, but are serious as well as more liable in manholes where the unprotected cables may be injured when resting on sharp corners, or by careless handling. In future installations it is desirable that no power cables be placed in subways other than actual connections to third-rails, trolley wires and switches, but much can be done in the way of prevention, such as separation of the different types of service by considerable distances, much greater use of concrete or earthen barriers, better protection and support where there is a change of level of cables, removal of pipes or other conductors from the vicinity of cables. The mechanical protection of all splices and exposed cables by wrappings and split tiles is recommended. It also favors a separation of ground return cables from feeders and highly commends the practice of the Boston company in making but slight cross-connections between the lead sheathings. Small rubber-covered wires used in signal, lighting and telephone service need classified separation for service continuity, but are not factors that are to be considered of moment in relation to safety.

The continuous use of the ventilating fans originally installed for subway service at Boston has been found unnecessary, except in the East Boston tunnel, which passes

beneath Boston Harbor. The report recommends the reversal of the direction of air flow in the latter tunnel so that air will be forced in emergencies from stalled cars toward the stations, and the provision of remote-control for fan motors. Distant control from one or more points on each side of the fan and a reserve source of power are advised.

The frequent installation of telephone stations with blue-light markers and duplicate circuits placed near the subway roofs is also advised, the lamps to burn constantly. The report also recommends the clearer marking of exits and the use of fastenings at the gratings and doors of emergency exits which can be opened without any special skill, knowledge or strength. The present provision for emergency lighting of subways and tunnels is commended, but it is suggested that some of the older installations can be improved, both as to the location of lighting cables and safety from interruption by accidents. Two red tail lights are recommended for all cars and trains entering subways, with the exception of certain short loops. Special oil or storage-battery lighting in the cars has been carefully considered, but where the distances are so short seem unnecessary, provided the emergency lights and the blue-light markers are intelligently planned and installed. The clearer indication of the location of fire protection apparatus is favored, with the use of entirely fireproof car construction in the East Boston tunnel and in all new rolling stock equipment for tunnel service, with the provision of non-combustible flooring for wooden or partly wooden cars in the Washington Street tunnel, together with the use of automatic stops in the East Boston tunnel and other minor improvements.

BOARD REPORTS ON GRADE CROSSINGS

Interurban Line in Los Angeles Should Elevate or Depress Tracks—City Line Should Use Viaducts or Subways in Business Districts

The Board of Public Utilities of Los Angeles, Cal., has issued a report dealing with grade crossing elimination, transportation and congestion. The report concludes that the problem as it concerns electric carriers is brought down to this: (1) Interurban railway to be elevated or depressed, as the particular locality requires, and to be removed from the street surface, such elevated or depressed tracks to lead to suitable terminals or to a loop subway with no terminal; (2) viaducts at all principal thoroughfares across the industrial district to accommodate vehicles and street cars, and (3) street railways to use viaducts across the industrial district, subways through the congested retail district and rerouting. The conditions necessitating such expenditures are said to be not chargeable to any one party and the costs should be distributed among the interests affected.

In regard to the interurban system of the Pacific Electric Railway, the report states that as long as the company is occupying the city streets, it would seem that the public right for such use could, on demand, require that all cars should accept local passengers and stop at all intersecting streets in order to provide for the fullest accommodation of the local public.

Continuing, it says: "This would inconvenience and seriously interfere with the interurban traffic for which this road is primarily designed. The province of the interurban lines is to connect the interurban population and freight with the city. Cars of 35 to 40 tons, geared for high speed, cannot be operated economically or safely on the surface of the streets, calling for stops at every corner; they should reach the city limits in the shortest space of time and with as few stops as possible. This can never be accomplished while interurban lines occupy the surface of the city streets, alone or jointly with the local city lines, at least in the congested parts of the city. They should be required to elevate or depress all lines, above or below the street surface, throughout the congested district, with liberal allowance for increase in the area of this district, or, better still, to the city limits; or to use a private right-of-way involving few grade crossings of streets or other

railroads. There are no serious difficulties presented as to physical construction, and the money saved in the operation of these cars through the congested district, the economy in operation and maintenance—especially in the renewals to the surface of streets, cheaper roadbed construction and freedom from accidents due to surface conditions—would pay a fair rental and interest on the cost of construction.”

Many of the troubles of the local Los Angeles Railway are said to be due to the blocking and congestion of traffic by the interurban cars in the congested district and to the numerous railroad crossings that have to be flagged. It is believed that studies now under way for rerouting and subways would solve the remaining congestion.

MINNEAPOLIS LINE WANTS NEW FRANCHISE

Street Railway Takes Initiative—Asks for Valuation and Proposes Transportation at Cost

On June 8 C. G. Goodrich, president Minneapolis (Minn.) Street Railway, addressed a letter to the City Council of Minneapolis asking that steps be taken for the renewal of its franchise, which still has eight years to run. The request was referred to the special committee on street railway matters, which was instructed to negotiate with the railway for the purpose of drawing up a franchise ordinance to be submitted to the people.

The committee met on July 14 for its first formal session, at which time a letter was submitted from Mr. Goodrich briefly outlining the franchise features which he deemed fundamental. In general outline the plan closely resembles the one which has been in operation in Cleveland for four years and is known as the “transportation at cost” plan. Though not worked out in detail, the suggested plan contemplates: 1. A fair valuation upon the company's property. 2. Assurance of a fair and reasonable return to the company upon this valuation. 3. The turning over to the city of the net surplus earnings after this charge has been taken out; the city's portion to be used, after it has sufficiently accumulated, in the reduction of fares or for other transportation purposes as the city may determine.

The plan also embodied the following statements relative to purchase, improvements and depreciation:

“The enabling act which was passed by the last Legislature permits the city to enter into an agreement that will give it the right to purchase at the end of any five or ten-year period. This company has no objection to giving the city this right to purchase at any time upon reasonable notice and on a fair basis to be agreed upon.

“At the present time there is a strong demand for the building of new lines and the extension of old lines to keep pace with the city's growth. Such new lines and extensions will require additional cars and power-house equipment, and this demand will continue naturally every year. The money expended for such necessary improvements can be added to the value agreed upon.

“Funds should be set aside for depreciation and renewals, as this is as much to the interest of the city as it is to the company, for the highest state of efficiency can only be obtained by maintaining the property in the best possible physical condition.”

RHODE ISLAND MEN TO ARBITRATE

The strike inaugurated at midnight on July 14 by the Street Car Men's Union against the Rhode Island Company, Providence, R. I., when the officers of the latter corporation refused to accept as arbitrators three men named by the union, was ended at 1.15 a. m. on July 17, when an arbitration agreement was signed by both parties to the controversy and the men were ordered back to work. All the cars were in operation on the morning of July 17 after the two-day tie-up of practically all service in Rhode Island.

On July 15 Mayor Gainer offered his services to both parties in an endeavor to bring them together in the matter of arbitrators. After a series of conferences with the Mayor the union men withdrew their ultimatum regarding arbitrators, and, adopting as their own the proposal made by the trustees of the Rhode Island Company on July 14, suggested that the board of arbitration be made up of one

man appointed by the union, one man appointed by the Rhode Island Company, and Mayor Gainer, who should be the chairman.

On July 20 the board of arbitration was agreed upon as follows: Mayor Gainer, chairman; Michael J. Houlihan, representative for the company, and Henry T. Baldwin, representative for the union. Public hearings will begin on July 26. When all evidence is in, the board must report within thirty days.

The questions to be arbitrated are the rate of wages to be paid by the company to all members of the association and the determination of the number of hours, if any, to be guaranteed extra men for a minimum day's work. It is specifically provided in the agreement that the arbitrators shall have no right to fix any scale of wages made conditional upon any co-operative plan or upon any plan based upon future earnings of the company, and that the wage scale, as fixed by the board, shall date back and become effective as of June 1, 1915.

The board of directors of the company met on July 17 and passed a resolution approving the action of President A. E. Potter during the events leading up to the declaration and the ending of the strike.

ELECTROLYSIS TESTS IN LORAIN, OHIO

The suit of the Cleveland, Southwestern & Columbus Railway against the city of Lorain, Ohio, filed some time ago in Common Pleas Court at Elyria to prevent the enforcement of an electrolysis ordinance passed by the City Council, was recently withdrawn, since extensive tests showed that its road was now being operated well within the ordinance requirements. When the ordinance was passed it seemed likely that changes entailing the expenditure of a large amount of money would be necessary to put the equipment in shape to comply with all the requirements. Later the company concluded that such changes as were shown to be necessary would result in a saving to itself as well as a benefit to the city. The changes were, therefore, made, and the real outlay proved to be comparatively small in the end.

The tests, covering a period from April 19 to April 27, 1915, were made by A. P. Lewis, representing the Cleveland, Southwestern & Columbus Railway; Albert F. Ganz of Stevens Institute of Technology, representing the Logan Natural Gas & Fuel Company; Samuel S. Wyer, consulting engineer of Columbus, Ohio; Elam Miller and H. S. Warren, New York, representing the American Telephone & Telegraph Company, and E. S. True, Chicago, representing the general group of Bell Telephone Companies. Mr. Herrick represented the Lake Shore Electric Railway in the tests and E. W. Moore, F. W. Coen and Mr. Herrick were present at a number of the conferences. The interests indicated above joined in making the tests.

The ordinance requires among other things that all metallic conductors forming parts of current-carrying circuits be insulated from the ground wherever it was practical to so insulate them; that the average potential difference during any ten consecutive minutes between any two points 1000 ft. apart on such metallic conductors should not exceed 1 volt, and that the average potential difference between any two points more than 1000 ft. apart should not exceed 7 volts; that insulated potential wires be installed from an adequate number of points on the insulated metallic conductors, together with voltmeters, so arranged that the potential differences between these points on the metallic conductors could be readily and accurately measured. Very careful tests were made with respect to these points and the voltage drop of the tracks was noted for various distances on all the lines in the city. The data were all gathered in a report that was submitted to the interested parties.

NEW FRANCHISE GRANTED IN CLEVELAND

The franchise granted the Cleveland & Youngstown Railroad by the city of Cleveland last week provides specifically for the entrance of any interurban railways whose tracks may be crossed by the tracks of the new company. It is understood that this means that any interurban road that desires access to the central part of the city by means of its tracks may build to it for that purpose. The company

is required to co-operate with such roads in every way possible when they wish to use its tracks for this purpose, or make any change that may be found necessary. It is said to be the purpose of the company to provide a double track to be operated at high speed for the accommodation of the interurban lines. If terms for this service cannot be agreed upon between the interested companies it is provided that the matter shall be submitted to a board of arbitration.

The city reserves the right to use a strip of land approximately 50 ft. wide at the present location of East Twenty-third Street for a subway for street railway traffic, but the company may build over it and use it as may be necessary for its own benefit above the point required by this reservation.

It is the intention of the company to build a joint steam and interurban passenger station at a point near the business district where land has already been acquired for the purpose, but the amended franchise passed has little to say about this. In fact the greater part of it applies to the freight terminal, over which there was rather bitter contention.

The Citizens' Referendum League, an organization recently formed, is preparing petitions for a referendum vote on both this franchise and the one granted at the same time to the Cleveland, Akron & Canton Terminal Railroad, which is planning to build a four-track electrically operated freight subway under East Fifty-fifth Street from the lake to the southern city limits. Friends of the referendum movement claim both companies have been allowed too much liberty in the franchises and that the city has failed to provide for proper supervision of operation, especially as respects the Cleveland, Akron & Canton Terminal Railroad. They also oppose the franchise to the Cleveland & Youngstown Railroad on the ground that it is closing too many streets where its freight terminal is to be established.

COURT REFUSES TRANSIT DELAY

Judge Sulzberger on July 17, after a hearing in Common Pleas Court, refused an injunction asked by David E. Dallam, a real estate dealer, to restrain the city of Philadelphia from issuing bonds for \$6,000,000 authorized for the Broad Street subway and Frankford elevated systems. The court, however, issued a cautionary order holding the litigation *in statu quo* until after a decision of the State Public Service Commission, which will hold a special meeting on the project at Harrisburg on July 26.

City Solicitor Ryan said no actual work would be commenced under Director Taylor's plans until a decision was obtained from the commission. Judge Sulzberger, however, ruled that the Department of Transit may proceed with its advertisement for bids, Mr. Ryan asking that these preliminaries be not interfered with, as such a condition would deter bidders and tend to raise prices because of a suggestion of uncertainty.

As the preliminary step incident to the construction of the Broad Street subway, Director Taylor on July 14 awarded the contract for the building of a sewer under Buttonwood Street, between Thirteenth and Broad Streets. The work is to begin on Aug. 4 and must be completed in two months. The building of the sewer was said to be in no way affected by the taxpayer's bill in equity attacking the legality of the \$6,000,000 loan. Separate proceedings would be necessary to stop the construction of the sewer.

TOLEDO FRANCHISE CONFERENCE CONTINUED

In the discussion of the proposed Toledo Railways & Light Company franchise at Toledo, Ohio, Henry L. Doherty, chairman of the board of directors, told the special franchise committee of the City Council on July 16 that the two points in the present draft which will make it difficult to secure funds for improvements, are the time for making a valuation and the requirement that the company accept bonds as part payment for the property. He said that conditions are bad at this time and he doubted whether it would be possible to raise \$2,000,000 for that purpose under the conditions proposed in the franchise. When questioned for his reason for objecting to the acceptance of bonds in part payment for the property, Mr. Doherty suggested that the committee consult with some of the

local brokers for a reply. He proposed that the clause giving the city an option to purchase the property be eliminated from the draft altogether. Members of the committee agreed to consider this. Mr. Doherty said further that he could not see how the company could be termed a "going concern" unless some value is placed on the franchise. The committee objects to allowing anything for the franchise in case the city decides to purchase the property.

At a conference on the day previous clauses in which changes are to be made were discussed and in some cases agreements were reached. Mr. Doherty insisted that the question of valuation of the property should be settled before going any further, but some of the members argued that this should be among the last things to be considered. Mr. Doherty objected to extending the 3-cent fare privilege which is now allowed for the benefit of workers. Member Dotson conceded the point that the city should make good any losses the company might suffer from an unreasonably low fare during the try-out periods. Mr. Doherty then suggested that these periods should not be too long, as the company might be bankrupted before their termination, when a settlement with the city could be made.

OLD ALBANY CONTRACT RENEWED

On July 20 C. F. Hewitt, general manager United Traction Company, Albany, N. Y., renewed the old working and wage agreement with the employees, under the same terms as to working conditions and wages, for a period of one year from July 1, 1915.

The demand of the United Traction Company employees that they receive the runs of the members of the Brotherhood of Locomotive Engineers operating Hudson Valley Railway cars over United Traction Company's rails between Waterford and Troy, N. Y., has been deferred until after the annual convention of the Amalgamated Association to be held in Rochester, N. Y., commencing on Sept. 13. At this time it is expected that the convention will appoint a committee to confer with a committee from the Brotherhood of Locomotive Engineers to adjust the situation satisfactorily between the two unions and relieve the United Traction Company of responsibility in the matter.

The settlement of the matter in this manner is considered a complete victory for the company, as it won all of the points at issue in the recent controversy.

NO CONSENTS NEEDED IN CLEVELAND

According to a decision of the Ohio Supreme Court, rendered on July 20, the Cleveland (Ohio) Railway may now build tracks on any street in Cleveland on which Council may authorize it to do so, without the consents of owners of abutting property. Under this decision the provision of the city's new charter, conferring this power on the City Council, supersedes the State law as far as Cleveland is concerned, although it does not change matters in cities and towns which have no charters or whose charters do not contain this provision. This was the case of Charles F. Brush and others against the city and the Cleveland Railway to prevent the invasion of a section of Euclid Avenue, locally known as "Millionaires' Row." The case of residents of Reading Road, Cincinnati, against the city of Cincinnati and the Cincinnati Traction Company, resulted in a decision in their favor, since Cincinnati has no charter.

The Cleveland Railway began the construction of tracks on Euclid Avenue, between East Twenty-second and East Fortieth Streets, at 4 a. m. on July 21. About three weeks will be required to complete the track. The company has not announced details of car routing when this section is placed in operation, but it is probable that all regular Euclid Avenue cars will be routed over it, while Wade Park cars and some others may continue to go over the Prospect Avenue track. Euclid Avenue cars will save about five minutes in running time by going over the new track, it is estimated. There is a possibility that the Prospect Avenue track may be extended from East Fortieth Street over Carnegie Avenue to East Fifty-fifth Street, but this has not yet been definitely decided.

New Electrification Project Reported.—It is reported that it is proposed to electrify the Schomburg & Aurora Railway, which extends from near Bond Lake to near Lloydtown, Ont. Part of the material has been ordered.

Rehearing Denied in Ulster & Delaware Case.—The first step in the appeal from the recent decision of the Public Service Commission for the Second District of New York denying the Ulster & Delaware Railroad permission to raise its mileage rate above the 2-cent maximum set by the Legislature, as noted in the *ELECTRIC RAILWAY JOURNAL* of July 17, was taken on July 16 when the commission formally denied the company's application for rehearing.

Commissioner Disfavors Civic Car Line Shops.—In reply to a request for an estimate of cost, Works Commissioner Harris on July 16 reported to the Board of Control that in his opinion it would be unwise to proceed with the establishment of civic car line shops in Toronto. He did not think the city could build cars as economically as a private company serving the whole of Canada. The reply was not considered satisfactory and the matter was referred for more details.

Change in Name of Oregon Commission.—On July 1 the name of the Railroad Commission of Oregon was officially changed to the Oregon Public Service Commission. Recognizing that the name "Public Service Commission" more correctly defines the powers possessed by this branch of the State service, the Legislature last winter passed an act providing for a change of name on July 1. There is no change in the jurisdiction of the commission. The commission has established an office in Portland.

Company Presents New Franchise in Waukegan.—The Chicago & Milwaukee Electric Railroad, Highwood, Ill., has presented a new franchise to the city of Waukegan, Ill. In this franchise it agrees to pay all back taxes but asks to be relieved of building the loop in the North Side residence districts within a period of one year. According to the franchise there must be at least three through cars in each direction. The company asks to be allowed to assume the franchise of the Waukegan, Fox Lake & Western Railway on certain streets until its expiration.

Iowa Section of N. E. L. A. to Meet at Dubuque.—The 1916 convention of the Iowa section of the National Electric Light Association is to be held in Dubuque instead of Ames, as previously announced. The former selection has been declared void on account of the illegal inclusion of votes by class "C" members, the choice of Dubuque being later made by a mail canvass among the qualified voters. It is considered probable that the Iowa District Gas Association and the Iowa Street and Interurban Association will hold their conventions at the same time and place.

Car Tax Proposed in Kansas City.—An ordinance has been introduced in the City Council taxing street cars of the Metropolitan Street Railway, Kansas City, Mo., \$60 each a year. The measure is intended to become operative in case the reorganization of the street car system is effected, in which event the income to the city under the present "peace agreement" would cease. The city now receives 8 per cent of the company's gross income. Last year this amounted to \$430,000, which paid the company's taxes, \$274,000 and left about \$160,000. Under the new franchise the city would receive no cash from the car fares until all revenue above 6 per cent, by being put into extensions and improvements, had raised the physical value of the property to \$30,000,000.

Company Appeals Against Forced Extensions.—Counsel J. B. Howe of the Puget Sound Traction, Light & Power Company, Seattle, Wash., has filed in the Federal Court a formal appeal from a decision recently rendered by Federal Judge Frank H. Rudkin upon the company's application for an injunction against the Public Service Commission enforcing its order to extend its Alki Point, Fauntleroy Park and Ballard Beach lines beyond the termini provided by the company's charter. The company contends that the order violates the provision of the federal constitution forbidding the impairment of contract obligations, and also that it deprives it of vested rights without due process of law, for the reason that to comply with the order will mean a large financial loss upon these lines that cannot be offset by the operation of its other lines.

Financial and Corporate

ANNUAL REPORT

American Railways

The board of directors of the American Railways, Philadelphia, Pa., has changed the end of the fiscal year from June 30 to Dec. 31. For this reason the annual report recently issued shows only the operations for the six months to Dec. 31, 1914, as compared to the similar six months of the preceding year.

The total number of passengers carried was 54,461,989, a decrease of 837,941, or 1.51 per cent. The gross receipts of the subsidiary companies were \$2,881,875.21, a decrease of \$5,523.80, or 0.19 per cent. After payment of all operating expenses, interest and taxes, the net income was \$294,087. Dividends were paid amounting to \$254,615, leaving a balance of \$39,472 to be added to surplus.

The subsidiary companies spent on maintenance of track, roadway and equipment, including sums set apart to cover depreciation, an amount equal to 18.81 per cent of the gross receipts. There was charged out of earnings to payments into sinking funds \$19,554 and also paid and retired \$15,000 of maturing car trust certificates, series A. Taxes accruing to state and federal governments amounted to \$134,813, or 4.67 per cent of the gross receipts. An amount of \$997,875 was expended for new capital purposes during the period.

In discussing individual companies the report notes that the Altoona & Logan Valley Electric Railway, Altoona, Pa., secured gross receipts of \$319,335, a decrease of \$16,119, or 5 per cent. Net receipts were \$118,208, a decrease of only \$5,285, a saving of \$10,834 having been effected in operating expenses. The receipts of the Bridgeton & Millville Traction Company, Bridgeton, N. J., were reduced more than 7 per cent by the curtailment in general business. The gross receipts of the Chicago & Joliet Electric Railway, Joliet, Ill., were \$306,181, a gain of \$2,007, while the net receipts decreased \$5,338. There was a slight falling off in the gross receipts of the railway, electric light and gas departments of the Lynchburg Traction & Light Company, Lynchburg, Va. Altogether it was but \$2,088, or less than 1 per cent. The operating expenses in all three departments increased \$24,817. There was set aside for reserve for depreciation of way and structures and equipment an additional sum of about 5.5 per cent of the gross receipts.

The Ohio Valley Electric Railway, Huntington, W. Va., reports gross receipts of \$358,848, an increase of \$30,356, or about 8.5 per cent. The railway earnings increased \$12,222 and the lighting earnings \$18,134. The gross receipts of the Peoples Railway, Dayton, Ohio, were \$221,819, as compared to \$243,681 in the prior period, a loss of 10 per cent. The net receipts increased \$4,886. This reduction in operating cost was brought about largely by reason of improvement made in the operation of the power house. The Roanoke Railway & Electric Company, Roanoke, Va., had gross business of \$321,977, an increase of \$8,812, or about 2.75 per cent. There was a net increase in lighting customers of 421 and a gain of 125 hp. in motors. The gross receipts of the Scranton (Pa.) Railway were \$760,274, an increase of \$18,395, or about 2.5 per cent. The Springfield (Ohio) Railway reported gross receipts of \$178,405, a loss of \$17,682, or 9 per cent.

LUMP VALUATION CRITICISED

The Missouri Public Utilities Commission was temporarily enjoined by Judge A. S. Van Valkenburgh of the United States District Court on July 7 from lowering the rates of the Springfield Gas & Electric Company, a subsidiary of the Federal Light & Traction Company. The practice of state commissions in making a lump valuation of a public utility property, and fixing a rate on this valuation without going into details, received a blow from the decision.

As reported in the *ELECTRIC RAILWAY JOURNAL* of July 11, 1914, page 87, the commission placed a valuation of \$300,000 on the property of the company used in electric service, ordered a reduction of 30 per cent in rates and

held that 7 per cent was an adequate return on the investment as fixed. The restraining order is now granted evidently on the assumption that the valuation made by the commission was not in all respects a fair one, and the findings of the commission not made as required by law. An indemnifying bond is required of the company to protect consumers in case the courts finally uphold the rates as made by the commission.

In its decision granting the temporary injunction the court said: "The court has been embarrassed in its review by the form of the decision of the commission and its findings, which enumerate in general terms the items included but fail to specify the amount allowed for each. It may be doubted whether a decision and findings which state nothing but the total valuation fixed by the commission, without showing the amount allowed for each item included, would be a compliance with the manifest purpose of the law to permit the parties to test in court the questions involved." A determination of the merits of the case will be reserved for final hearing.

TAX VALUES SET IN WEST VIRGINIA

The announcement of the State Board of Public Works of West Virginia, made on July 19, showing the valuation of public properties for tax purposes, indicates an increase of \$1,135,000 in the valuation of electric railway and power lines over the figures for 1914. The list of roads, with the valuations that have been fixed by the State board for 1915, follow:

Appalachian Power Company.....	\$240,000
Charleston Interurban Railroad.....	1,150,000
City Railway (Wheeling).....	400,000
Charleston-Dunbar Traction Company.....	160,000
East Liverpool Traction & Light Company.....	210,000
Elkins Electric Railway.....	25,000
Fairmont & Mannington Railroad.....	400,000
Grafton Light & Power Company.....	130,000
Lewisburg & Ronceverte Electric Railway.....	40,000
Monongahela Valley Traction Company.....	5,000,000
Morgantown & Pittsburgh Railway.....	6,000
Morgantown & Wheeling Railway.....	175,000
Newell Bridge & Railway Company.....	125,000
Ohio Valley Electric Railway.....	1,075,000
Panhandle Traction Company.....	650,000
Parkersburg & Marietta Interurban Railway.....	1,000,000
Princeton Power Company.....	100,000
Stebenville, Wellsburg & Weirton Railway.....	350,000
South Morgantown Traction Company.....	35,000
Tyler Traction Company.....	225,000
Union Traction Company.....	110,000
Wheeling Traction Company.....	2,000,000
Wellsburg, Bethany & Washington Railway.....	40,000
West Virginia Traction & Electric Company (Wheeling).....	1,100,000
West Virginia Traction & Electric Company (Morgantown).....	425,000
Total assessments.....	\$15,171,000

LOSS IN INDIANA VALUATIONS

The report of the Indiana State Board of Tax Commissioners shows a loss in electric railroad valuations of \$188,347 over the 1914 totals. A large part of the decrease, however, resulted from changes in classification of the mileage reports of Indianapolis properties because of conditions made necessary by State regulation. The following shows the increase of values placed on electric railroad properties in Indiana for the past seven years: 1909, \$21,536,041; 1910, \$22,376,238; 1911, \$23,524,951; 1912, \$24,703,253; 1913, \$25,701,134; 1914, \$27,173,747; 1915, \$26,985,400. The losses and gains in the trackage of the interurban roads are published in detail in the following table:

	1914, Miles	1915, Miles	Loss, Miles	Gain, Miles
Main track.....	2,137.25	2,087.20	50.05	
Second main.....	191.65	148.02	56.37
Side track.....	108.50	109.77	1.27
Rolling stock.....	2,214.98	2,164.93	50.05
Totals.....	4,552.38	4,509.92	100.10	57.64

Some of the tax officials believed that some of the decrease in the electric railroad valuations might be attributed to jitney bus service in some of the cities, but it is probable that this is more or less a negligible consideration this year.

Chatham, Wallaceburg & Lake Erie Railway, Chatham, Ont.—The Hydro-Electric Power Commission of Ontario is negotiating with the Canadian Northern Railway for the purchase of the Chatham, Wallaceburg & Lake Erie Railway, which runs from Erie Beach to Wallaceburg.

Chicago (Ill.) Surface Lines.—The Illinois Public Utilities Commission has granted the application of the Chicago City Railway for permission to issue first mortgage 5 per cent gold bonds to the amount of \$1,492,000. Permission has also been granted to the Calumet & South Chicago Railway to issue bonds of a similar character to a total amount of \$500,000.

Detroit, Almont & Northern Railroad, Detroit, Mich.—An amount of \$400,000 of first mortgage 6 per cent gold bonds of the Detroit, Almont & Northern Railroad, dated Feb. 1, 1915, is being offered by Eversz & Company, Chicago, at par and interest. The bonds are guaranteed and assumed as a direct obligation, by endorsement, by the Detroit United Railway.

Gary & Interurban Railroad, Gary, Ind.—Plans are being worked out for the financial relief of the Gary & Interurban Railroad. The City Council has refused to allow the line a straight 5-cent fare and insists that the 3-cent rate be maintained. It is said that the refusal of the Council to allow the increase will be brought to the attention of the Indiana Public Service Commission. There is some probability that the road will go before the commission and give up its Gary franchise. The company defaulted on its interest payments Jan. 1. Previous references to the condition of this company were made in the *ELECTRIC RAILWAY JOURNAL* of Jan. 9 and March 6.

Kansas City Railway & Light Company, Kansas City, Mo.—The committee of which John B. Dennis is chairman, has notified holders of certificates of deposit representing the 6 per cent five-year collateral gold notes of the Kansas City Railway & Light Company, due on Sept. 1, 1912, that the time in which depositors of such notes will be entitled to receive new securities or cash pursuant to a sale or a plan of reorganization of the company, or have the deposited notes or the proceeds thereof returned to them, has been extended for one year from Aug. 15, 1915.

Lancaster & York Furnace Street Railway, Millersville, Pa.—The Lancaster & York Furnace Street Railway has defaulted the July 1 interest payment of \$2,750 on its \$150,000 of first mortgage 5 per cent twenty-year gold bonds. It is reported that the failure of the company's bankers, Woelpper, Crawford & Company, Philadelphia, was the cause of the default.

London & Port Stanley Railway, London, Ont.—The lease of the London & Port Stanley Railway to the Père Marquette Railway terminated on June 30, on which date the property passed under the control of the Port Stanley Railway Commission. This is now operating the line as part of the proposed system of radial railways to be controlled and operated under the jurisdiction of the Hydro-Electric Power Commission of Ontario. The formal opening of the road as an electric carrier was set for July 22.

Merrill Railway & Lighting Company, Merrill, Wis.—The Merrill Railway & Lighting Company has announced that it will surrender its charter on account of not being able to operate except as a losing proposition. No cars are at present running.

Montreal (Que.) Tramways.—It is reported that the Montreal Tramways will issue \$1,000,000 of new common stock which will be offered for sale to present stockholders at the par value thereof.

Rock Island Southern Railway, Rock Island, Ill.—The Rock Island Southern Railway, which operates the electric line from Monmouth to Rock Island, is to be reorganized and have its bonded indebtedness readjusted. On July 1 the "north line" was unable to pay interest due and also faced necessary repairs and extensions. A meeting of a number of bondholders was held and a plan of adjustment decided upon, request for approval being sent to other bondholders. In an interview, A. Walsh, president of the line, said: "I am confident that the plan of readjustment will be of great advantage to Monmouth. It will put the north line in excellent financial condition and in a position where it can give even better service than heretofore. Every bondholder is fully protected in the full amount of his holdings. For each \$1,000 bond he receives a new first mortgage bond for \$400, first preferred stock for \$600 and \$100 of bonus common stock. This common stock is given from that

held by the present stockholders. The value to Monmouth which is to come from this readjustment will be in many added improvements to the property, especially to the terminals at Rock Island. There will be added some electric locomotives to take the place of the present steam locomotives, thus increasing freight facilities and the general service." A complaint by minority stockholders was noted in the *ELECTRIC RAILWAY JOURNAL* of May 1.

San Joaquin Light & Power Corporation, Bakersville, Cal.—The San Joaquin Light & Power Corporation has filed a supplemental application with the California Railroad Commission, asking for authority to pledge a portion of the \$1,582,000 of 6 per cent bonds which it was recently authorized to sell. The corporation proposes to pledge a portion of these bonds as collateral security for short-term notes of \$809,000. It is proposed by the corporation that the new notes shall run for a period not to exceed two years, and that the money received therefrom shall be used to pay off the two-year collateral trust notes of the company which mature on Aug. 1, 1915.

Springfield (Mass.) Street Railway.—It is reported that plans for merging the Springfield Street Railway and the Worcester Consolidated Street Railway, which according to reports have been under consideration for the last five months, will probably materialize this year. It is believed that the plan under consideration is to consolidate the two companies into one large system with one set of officers and to establish a large general office in either Springfield or Worcester. These two companies are now owned and controlled by the New England Investment & Security Company, which is the holding company for nearly all the trolley lines formerly owned and operated by the New York, New Haven & Hartford Railroad in Massachusetts.

Tidewater Southern Railway, Stockton, Cal.—It is reported that the Tidewater Southern Railway has sold \$100,000 of bonds to banks at Modesta and others, which has enabled it to commence construction to Turlock. In November, 1914, the company was operating 33.5 miles of single track between Stockton and Modesta.

Toledo, Ann Arbor & Jackson Railroad, Toledo, Ohio.—Application has been made to the Public Utilities Commission of both Ohio and Michigan by the Toledo, Ann Arbor & Jackson Railroad for permission to issue \$385,000 of bonds. The company is laying track between Deerfield and Dundee and it is reported that a freight service may be established between Toledo and Detroit, as well as an inter-urban passenger business.

Tri-State Railway & Electric Company, East Liverpool, Ohio.—The Tri-State Railway & Electric Company has received permission from the Ohio Public Utilities Commission to sell its property in Ohio, a section of track in Steubenville, to the Steubenville Railway for \$9,000. The latter company has been authorized to issue capital stock for that amount to pay for the track.

United Gas & Electric Corporation, New York, N. Y.—Through the purchase of \$1,000,000 of its \$5,500,000 of three-year 6 per cent notes, the sale of which was noted in the *ELECTRIC RAILWAY JOURNAL* of March 6, the United Gas & Electric Corporation has anticipated the retirement of \$500,000 of the notes on July 1, 1916, and \$500,000 on Jan. 1, 1917, as provided in the indenture covering the notes.

United Railways of St. Louis, St. Louis, Mo.—The quarterly report of the United Railways of St. Louis for the three months ending June 30, filed on July 15 with City Register Witter, shows the street cars carried about 2,160,000 more passengers in that quarter than in the previous three months. The statement also shows that the cars carried about 5,000,000 less than in the corresponding three months of last year, which was before the jitneys began to operate in St. Louis. Officials familiar with the conditions assert that a portion of the 5,000,000 decrease in passengers was due to the operation of jitneys and the remainder was due to business conditions. The increase in the last quarter indicates that the business of the jitneys is decreasing and that general business is becoming more active. The cars made a total of 1,535,366 trips and traveled 9,699,118 miles in the last three months. A total of 54,522,328 full-fare passengers were carried and 1,112,985 half-fare, making a total of 55,635,313 passengers. The total num-

ber of passengers transported in the preceding three months was 53,475,810. The number in the corresponding three months last year was 61,959,691.

DIVIDENDS DECLARED

American Railways, Philadelphia, Pa., quarterly, 1¼ per cent, preferred.

Columbus Railway, Power & Light Company, Columbus, Ohio, quarterly, 1¼ per cent, preferred and common.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich., quarterly, 1½ per cent, preferred; quarterly, 1 per cent, common.

Grand Rapids (Mich.) Railway, quarterly, 1¼ per cent, preferred.

Lewiston, Augusta & Waterville Street Railway, Lewiston, Maine, quarterly, 1½ per cent, preferred.

Montreal (Que.) Tramways, quarterly, 2½ per cent.

Philadelphia Company, Pittsburgh, Pa., 5 per cent, preferred.

West Penn Railways, Pittsburgh, Pa., quarterly, 1¼ per cent, preferred.

Traffic and Transportation

TRAVELS WITH THE JITNEY

Philadelphia Ordinance Enjoined—Union Men in Norwalk Petition for Jitney Control—Jackson Company Affected by Competition

A preliminary injunction restraining the Mayor, Councils and other city authorities of Philadelphia from enforcing the jitney ordinance was granted on July 15 by Judge Sulzberger. The injunction holds until Sept. 20, when the Court of Common Pleas No. 1 may be applied to for a further hearing by either the city or the jitney operators. In the meanwhile, the court decrees, both sides may gather further evidence which will aid in arriving at a just decision on the whole question. Judge Sulzberger stated that the operation of the ordinance involves serious danger to the jitney, and would at least cut the business from 100 to 40 per cent, but that if the ordinance is declared valid, the delay will not have caused the city any pecuniary loss. A committee of three has been appointed to confer with Director Porter and agree on a set of temporary traffic regulations during the term of the temporary injunction.

Two of Philadelphia's jitney organizations, representing more than 700 operators, have decided to issue strip tickets at six for a quarter. They will be accepted in lieu of 5-cent fares by drivers of all cars operated by members of the Auto Service Association and the South Philadelphia Jitney Owners' Association. The only organization which has not signified its intention to issue strip tickets is the Jitney Association, whose president has announced that he would put the question up to his associates.

A committee representing the Norwalk Division of the Amalgamated Association of Street and Electric Railway Employees of America has petitioned the Council on behalf of the union that favorable action be taken on an ordinance presented by them to control and regulate the jitney business in Norwalk, Conn. The ordinance is strict and provides for annual fees of \$100 and \$200, fixed routes with transfers and indemnity bonds of \$10,000. The ordinance was tabled for consideration at a future meeting of representatives of the union, jitney drivers and Council.

The draft of a jitney ordinance, submitted by Commissioner Arthur R. Denman to the Board of Works of New-ark, N. J., on July 15 and laid over for further discussion, provides that car owners or licensees must report to the board the route and hours of service of each jitney, seating capacity, and what other facts may be required, as often as the board may so demand. The board receives the power to designate routes and hours of service, which shall not be less than ten hours daily; terminal points and the fixing of regulations for turning at the terminal.

B. W. Arnold, superintendent of traffic Chicago, Ottawa & Peoria Railway, Ottawa, Ill., has presented a copy of the Joliet ordinance to the La Salle City Council, with the request that they adopt it or some similar measure to regulate jitney buses. Mr. Arnold gave a short talk to the Council, in which he said that the interurban company had spent almost \$25,000 for paving in the twin cities, La Salle and Peru, in two years. He also said the company had an annual payroll of \$24,000 in La Salle and Peru. He asked that the jitney buses be licensed, forced to pay a fee of \$200 per year and compelled to publish and maintain a regular schedule. The petition was referred to a committee for investigation.

H. H. Davell, chairman of the board of governors of the Maryland Autobus Protective Association, formed to adopt some method of perfecting the jitney system in Baltimore, states that the association aims to amalgamate all the jitney service into one large corporation. It is stated that 300 buses can be put on the streets. Immediate steps are to be taken in the courts to test the validity of the ordinance just passed whereby each jitney owner will be required to pay an annual license of \$25 a seat.

One hundred and twenty-six jitneys have succeeded in passing municipal inspection in Portland, Ore., according to Municipal Jitney Inspector Gallup. Cars are being examined at the rate of twenty-five per day. The State Supreme Court has taken under advisement the suit instigated

by A. A. Thielke against Mayor Albee of Portland, to restrain enforcement of an ordinance regulating jitney buses in Portland. The ordinance was attacked in the Circuit Court on the ground that it was submitted to the people under a city ordinance, instead of under a State law; that it was discriminatory, gave the Public Utilities Commission arbitrary power, and violated the federal constitution, in that it would permit property to be taken without due process of law.

According to the report of L. H. Bean, general manager Tacoma Railway & Power Company, the jitney buses operating in Tacoma, Wash., have cut down the company's revenues \$70,000 for the first half of 1915. The city of Tacoma will lose \$1,500 in its share of gross receipts for this period. The police department in Tacoma has been instructed by Commissioner of Public Utilities Mills to arrest jitney passengers and drivers who violate the anti-smoking ordinance recently passed by the Council. This ordinance affects street cars and jitney buses alike and is being rigidly enforced on the cars.

The Jackson Light & Traction Company, Jackson, Miss., has filed with the City Commission an earnest protest against the insufficient character of ordinances regulating jitney traffic, and the unfair competition it has been forced to meet since the jitney became popular. In a letter to the commission Manager Raymond H. Smith insists that all jitneys should be placed under bond, in order to guarantee damages in case of accidents, and offers to furnish bonds for each street car operated by his system.

Some time since the commission passed an ordinance regulating jitney traffic, but Manager Smith says that it is not in any sense a regulation; that jitneys are not required to carry signs showing the routes they cover; they do not cover regular routes, it being their custom to traverse the busiest sections of the streets, turning around directly in front of trolley cars where people are waiting to pick up passengers, withdrawing the jitneys from service whenever they feel like it and otherwise avoiding the responsibilities of a common carrier.

Manager Smith admits that the jitneys have cut heavily into the revenues of the street railway and advises the commission that the company has been compelled to ship some of its larger cars out of town, to cut down the number of cars operated and to discontinue the services of a number of employees.

Automobile owners operating a jitney line between Texas City and Galveston, Tex., have filed two suits in the Fifty-fifth District Court at Galveston asking for an injunction to prevent city officials of Galveston from enforcing an ordinance adopted on April 9, regulating the operation of motor buses in that city. It is claimed by the plaintiffs that they are immune from provisions of the ordinance because their buses are not operated between points in Galveston or to any designated point within Galveston.

A petition for an election to recall Mayor Tyra and Police Commissioner Hudleston of Fort Worth, Tex., has been prepared by the jitney men of Fort Worth and will be presented to the City Commissioners within a few days. The petition, signed by about 3000 voters, is a result of the jitney ordinance now being enforced.

The Savannah AutoBus Company, with an authorized capital of \$250,000, has been incorporated by Savannah men for the purpose of operating autobuses on Savannah streets. The company has asked for a charter and will begin operations in August with ten buses of a capacity of thirty-five passengers each. There will be definite routes and schedules for the vehicles.

An ordinance has been passed by the Minneapolis (Minn.) City Council for the purpose of regulating jitneys in that city and signed by Mayor Nye. The ordinance provides for a license fee of \$15 a year for each car, indemnity bonds from \$5,000 to \$10,000, regular routes and schedules, with a limit of two passengers above seating capacity, inspection of cars and other regulations. It will take effect on Aug. 1.

Jitney bus owners in Flint, Mich., have obtained a temporary injunction restraining the city from enforcing the new jitney ordinance. It was asserted that the \$5,000 to \$20,000 bond and \$25 license fee were excessive. There are 151 jitney buses in Flint, sixty in service continually. The others operate only during rush hours.

HALT FOR KANSAS CITY JITNEYS

Buses of Jitney Corporation Seized on Note—Touring Cars Decreasing—One Line Raises Fare to 10 Cents

The jitney transportation situation is rapidly coming to a head in Kansas City, Mo. The Studebaker Corporation on July 18 took possession of fifteen buses furnished by it on a forty-bus order from the Kansas City Jitney Transportation Company, for failure of the company to meet a note due on a first mortgage. The National Jitney Association is quiescent, the offices are closed and no definite plans in hand. The White Star line of buses, embracing thirteen cars, individually owned and co-operating on schedules, began on the night of July 19 at the rush hour to charge 10 cents instead of the previous 5 cents a trip. Many individual buses have been eliminated, and the touring cars now in service on routes number only about sixty.

The embarrassment of the Kansas City Jitney Transportation Company is a serious blow to the industry. Its president is W. H. Miller, the leader of the movement in the West. Mr. Miller said of the situation: "We are now working on a plan of reorganization, and hope to get the buses back soon. We are compiling statistics of operation and management which will show where we have fallen short of the profitable operating plan."

It is said that the trouble was caused by large overhead expenses, as well as by the obvious difficulties encountered where a transportation company must hire men to collect money and handle expensive machinery. An officer of the Studebaker branch at Kansas City said that the buses were in good condition, showing 14,000 to 15,000 miles in the three months since they were put in service. He expressed confidence that jitney buses would pay at 5-cent fares when individually owned and carefully handled.

The White Star line owners have had a smaller overhead than the organized company, but they were glad of the chance to increase the fare to 10 cents. Their cars are mostly of the more expensive types. They confine themselves to routes to the southeastern part of the city. They admit only buses to their organization, contending that the touring cars are profitable only for popular priced livery service.

One local livery service, the outgrowth of the split between the private owners and the company organized by Mr. Miller, is said to be making good profits. It now has the stand and the telephones vacated when the Kansas City Jitney Transportation Company gave up its downtown headquarters.

The national association seems falling to pieces because of the failure of the local associations to pay dues for the support of the offices and to carry on the organization work. The National Indemnity Exchange, an insurance organization formed to protect jitneys, has not yet qualified, but may get its license soon.

JITNEY MOVEMENT IN OHIO

Jitneys Used in Many Ohio Cities—Meeting Ordinance and Regulatory Restrictions

The operation of jitney buses in Ohio is perhaps more extensive than might be anticipated. They have made little headway, however, in the largest cities.

In Columbus their operation seems to have been fairly successful. There operators have provided themselves with large cars with longitudinal seats. They operate over certain streets on regular schedules and sell tickets at the rate of six for 25 cents.

Toledo bus owners have asked the City Council to allow them to receive and discharge passengers at the same points at which the street cars stop. Up to the present time they have been compelled to observe the traffic rules and make stops at the safety zones, which are about 100 ft. from the street crossings.

Twenty-two bus operators paid the license fee required by the ordinance recently passed by Council at Youngstown, although the payment was made under protest. Operators in that city must obey the traffic ordinance.

In Lorain the bus operators have formed the Lorain Jitney Association and are now endeavoring to establish

a schedule on the streets occupied by car lines, so they may have a five-minute headway. The street railway company recently inaugurated a ten-minute service and found that a gain of patronage was the result.

At Ashtabula thirty buses were put out of business on July 13 by the decision of Common Pleas Judge A. G. Reynold sustaining the regulatory ordinance passed by the City Council some time ago. The ordinance fixed an annual tax of \$25 and required a bond of from \$3,000 to \$5,000, depending upon the size of the car. The jitney owners consider the ordinance prohibitive.

For a time quite a number of buses were operated in Cleveland, but for the most part they consisted of disreputable cars that people would not patronize. Since no one came forward with money to furnish the right kind of cars, it must appear to be a losing proposition in the face of the low street railway fare. Little comment is now heard in regard to the matter.

The Mahoning & Shenango Railway & Light Company brought matters to a climax at Youngstown on July 18 by refusing all jitneys entrance to Idora Park, which is owned and controlled by railway interests. An admission fee was also charged all visitors who entered the park in vehicles other than street cars. Those who paid, however, received street railway tickets for the return home. Owners of jitney buses retaliated by having three park employees arrested on the charge of violating Sunday closing laws. Vice-President Randall Montgomery of the company signed bonds for the employees and then announced that every jitney bus would be stopped and every store closed in Youngstown next Sunday unless the suits against the men are dropped. The fight between the railway and the jitneys promises interesting developments in the enforcement of the blue laws.

On July 19 the Ohio Electric Railway requested the city of Lima to return \$5,000 which it had deposited for the right to transport passengers to intercity points. The company says its business has shown a decline of 50 per cent at that point since jitney buses began operation within the city limits, and that as a consequence there must be reduced service until regulatory ordinances are adopted.

BRIDGE TRAFFIC IN NEW YORK

The Public Service Commission for the First District of New York has received from the bridge department the result of the annual count of passengers using the East River bridges in one period of twenty-four hours. The count was made on Nov. 5, 1914, from midnight to midnight. It shows a total traffic in both directions over all bridges of 763,982, which is an increase of 20,090 over the previous year. This is a gain of about 3 per cent, and much smaller than the gain of 1913 over 1912, which was more than 12 per cent. The Williamsburg Bridge still continues in the lead, carrying more passengers than the old Brooklyn Bridge. The latter is the only one of the four bridges which shows a positive falling off in the number of passengers using it. The figures include passengers in surface and elevated cars, in all kinds of vehicles, and pedestrians using the promenades. The following table shows the number of passengers passing in each direction over the four bridges:

	Williamsburg	Brooklyn	Queensboro	Manhattan
Eastbound	162,859	151,334	45,915	26,591
Westbound	164,275	142,372	43,932	25,804
Totals	327,134	293,706	89,847	52,395

Total traffic: 1912, 659,591; 1913, 742,992; 1914, 763,082.

The Brooklyn Bridge led all other bridges in traffic until the Center Street loop subway was opened in August, 1913, and connected with the elevated lines passing over the Williamsburg Bridge. This resulted in a large increase of the traffic over the Williamsburg Bridge.

Rockland Transfer Petition Granted.—The petition of the selectmen of Rockland for free transfer privilege on the Bay State Street Railway, Boston, Mass., has been granted by the Public Service Commission, with the understanding the company may soon ask for a readjustment of fares.

Near-Side Stop Approved for New Bedford.—The Massachusetts Public Service Commission has approved a regulation, passed by the Board of Aldermen on Oct. 22, 1914, that

near-side stops be used in New Bedford after Aug. 1. The commission also approved the clause requiring a safety stop to be installed on all street cars passing Bedford and County Streets.

Wage Increase Granted in Waterville.—It was announced on July 16 by Manager Patterson of the Waterville, Fairfield & Oakland Street Railway that a general advance of 1 cent per hour had been made in the pay of all men employed on the system. Bonuses for efficiency make a possible increase beyond this of about \$1 per week.

Petition for Fare Increase Withdrawn.—The Berkshire (Mass.) Street Railway has withdrawn its petition for a 6-cent fare over certain of its lines and a readjustment of its fare limits. The company is studying some other systems of fare arrangements and needed more than the three remaining months of life of the petition to complete its investigations. Ultimately another petition will be filed with the commission.

Good June Record in Louisville.—The Louisville (Ky.) Railway is holding up before its trainmen for their emulation in future months the excellent June record, in which only two collisions between cars were reported. These collisions were inconsequential and concerned bumping together of empties in the carhouses. During the same month the mileage was 963,939 car-miles for the city lines and 210,156 car-miles for the interurban lines, or a total of 1,173,095 car-miles.

Teaching Patrons in Elgin.—Patrons are being taught how to board street cars properly in Elgin, Ill., an experiment having been inaugurated on the Grove Avenue line. A white line has been painted a few feet from the track, and the patrons are asked to stay within this space and to line up in the same orderly way in which they approach a ticket window. There has been successful regulation of taxis and other motor vehicles in Elgin by the City Council, and the street railway wishes to carry the safety campaign further.

Tariff Supplement Issued to Cover Cummins' Amendment.—The baggage committee of the Central Electric Traffic Association at its recent meeting in Fort Wayne, Ind., decided to issue a supplement to the tariff in compliance with the Cummins' amendment to the interstate commerce act. Under the new system persons desiring to check for interstate movement baggage that is valued at more than \$100, will be required to pay an insurance fee. Persons who refuse to sign the slip giving the valuation cannot check their baggage.

Railroad Asks for Rescission of Service Order.—The Hocking Valley Railroad, Columbus, Ohio, filed a petition with the Ohio Public Utilities Commission on July 7, asking that the order requiring electric car service between Jackson and Hamden be rescinded. The following day the original complainants filed charges to the effect that the company is not now complying with the order, that steam cars are being used instead of electric cars and that they stop at the stations instead of in the center of the towns, as in the past. Previous reference to this order was made in the *ELECTRIC RAILWAY JOURNAL* of April 17.

New Summer Car Being Tried in Toronto.—The Toronto (Ont.) Railway is trying out a new type of summer car in compliance with the order of the Ontario Railway Board to place fifty new cars, which are to be approved by the board, the Toronto Railway and the city engineer. The new car is fitted with longitudinal seats on the devil-strip side and cross-seats on the open side. Instead of the side steps there is a wire grilling to protect the public. Passengers enter at the rear platform and leave by the front door as in the winter cars. Of the fifty cars included in the board's order, twenty have already been built on the plan previously in use, except that they are 3 in. wider. These cars, which are the widest that it is possible to operate on the present lines, will have to be changed if this test car meets with approval.

Accidents Have Decreased in Detroit.—W. E. Cann, chairman of the general safety board of the Detroit (Mich.) United Railway, in reporting the progress of the safety campaign to the safety committeemen, stated recently that

since the organization of the movement there has been a continual decrease in the number of accidents. The number of collisions has decreased more than 40 per cent; running over steam and street railway crossings, nearly 50 per cent; derailments, more than 10 per cent, and platform accidents to passengers, nearly 40 per cent. The only marked increase in accidents are those where automobiles have been struck, and Mr. Cann takes the position that it is entirely reasonable to lay the burden of this increase upon the increased number of automobiles and the carelessness of the drivers.

Fillmore Street Hill Operation for the "Movies."—Moving pictures have been made illustrating the operation of two-car trains on the United Railroads of San Francisco Fillmore Street hill line and are being shown with a popular "News of the Week" series in Pacific Coast cities. The reels start out with the diagrams of the cable connection details and safety devices, and show in proper order the methods of coupling, signaling and operating the trains. The most striking feature is the operation over the hill of two two-car trains coupled together and counterbalanced by a single two-car train. The four cars are stopped and held stationary on the 25.4 per cent grade. The underlying idea of the film is the advertisement of the absolute safety of the hill line since the recent installation of new safety devices.

Mr. Harmon Reports Accident Decrease.—James Harmon, general claim agent of the Insull lines in Indiana, while in New Albany on July 16 gave out a statement to the effect that the accident roll of the Louisville & Northern Railway & Lighting Company, the Louisville & Southern Indiana Traction Company and the Interstate Public Service Company, altogether making about 120 miles, and the Columbus (Ind.) city lines as well, showed a decrease of seventy accidents for the first six months of 1915, as compared with the last half of 1914. This decrease in casualties is attributed practically altogether to the safety-first efforts which have been made by the companies listed. The list for the last six months contains two fatalities resulting from an accident on the Louisville & Southern line, an accident, however, which was caused by reckless driving of the victim's automobile.

Skip-Stop to Be Tried in Chicago.—Plans have been carefully perfected by the Chicago (Ill.) Surface Lines for the installation of an experimental skip-stop line on North Clark Street, one of the heavy trunk lines out of the loop district to the north side of the city. This line is 10.7 miles in length, and the skip-stop schedule will begin about 0.5 mile outside of the loop district. The Chicago plan differs from that adopted in Cleveland and Kansas City in that the stops were designated as a result of a traffic survey. The total number of 120 stops on this line will be reduced to seventy, and it is contemplated that the skip-stop schedule will reduce the running time fifteen minutes for each round trip. All stops will be designated by a white band painted around the company's tubular-steel poles. If the experiment proves satisfactory, the skip-stop idea will be extended to other lines.

Pension System Established for Third Avenue Employees.—Frederick W. Whitridge, president Third Avenue Railway, New York, has announced the establishment of a pension scheme for the employees of the company and its subsidiaries. Pensions to be granted will range from \$20 to \$40 a month, the amount being based in part on the length of service and in part on the monthly pay received by the employee. Only those employees will be eligible who become members of the Third Avenue Railway Employees' Association and whose membership is continuous up to the time of the granting of the pension. The money for the payment of the pensions will be obtained by applying the interest of funds of the benefit association, and from the treasury of the Third Avenue system, which will pay whatever additional sum may be necessary. Any employee who has reached the age of seventy years, whether incapacitated or not, and who has been in continuous service of the system for at least twenty years will be entitled to a pension. Provision also is made for pensions for employees who have reached the age of sixty-five who have been incapacitated after being in the service for twenty years.

Personal Mention

Mr. Thomas Lynch, formerly superintendent of employment of the Detroit (Mich.) United Railway, has been appointed superintendent of trainmen's records. Mr. Lynch has been employed by the company continuously for thirty-five years.

Mr. Francis X. Disney, Elmira, N. Y., has been named secretary of the Public Service Commission for the Second District of New York, to succeed Mr. Frank H. Mott, whose selection for the counselship is elsewhere noted. Mr. Disney has been assistant secretary for the last two years.

Mr. Ledyard P. Hale, counsel for the Public Service Commission for the Second District of New York since its organization, has received a leave of absence without pay until Sept. 1 on account of the press of his duties as chairman of the public utility committee of the constitutional convention.

Mr. E. R. Giaque, formerly carhouse foreman at the Fourteenth carhouse of the Detroit (Mich.) United Railway, has been made assistant superintendent of the Fourteenth, Crosstown and West Warren lines to succeed Mr. Albert Bath, who has been appointed superintendent of these lines.

Mr. Arthur F. Brown has been appointed superintendent of employment of the Detroit (Mich.) United Railway. He has been in the company's employ for twenty years in various capacities, serving as inspector, carhouse foreman, chief inspector, assistant superintendent of both city and interurban divisions, and for the last twelve years as superintendent of various city lines.

Mr. Frank H. Mott, Jamestown, N. Y., formerly a deputy attorney-general and for the last two years secretary of the Public Service Commission for the Second District of New York, has been named counsel of the commission during the leave of absence until Sept. 1 of Ledyard P. Hale, noted elsewhere in this column. It is understood that upon Mr. Hale's return Mr. Mott will resume his private practice of law.

Mr. Albert Bath has been appointed superintendent of the Fourteenth, Crosstown and West Warren lines of the Detroit (Mich.) United Railway, to succeed Mr. Arthur F. Brown, whose appointment as superintendent of employment is elsewhere noted. Mr. Bath had been assistant superintendent of these lines for the last five years, previously for three years being employed as night and day carhouse foreman at various carhouses.

Mr. J. D. Cornell has been appointed traffic manager of the Joplin & Pittsburgh Railway, with headquarters at Kansas City, Mo. Mr. Cornell in 1904 was attached to the Southwestern Tariff Committee at St. Louis, and later as an adjuster traveled over much of the territory. Five years ago he took up electric railway traffic specialization, when he went to the Rock Island Southern Railroad as general freight and traffic agent to develop the traffic industry of that composite line, which handled freight chiefly by steam trains and passengers by electric.

Mr. Walter Jackson, associate editor *ELECTRIC RAILWAY JOURNAL*, has been appointed business manager of this publication. Mr. Jackson was born in 1882. He left public school at the age of thirteen, but entered the Cooper Union Night Schools within the following year, graduating therefrom as bachelor of science. In 1903, following service with several machinery companies, he joined the editorial staff of this paper. In connection with his editorial work, Mr. Jackson has traveled extensively, including several trips abroad. He has also acted as consulting editor with the McGraw-Hill Book Company in addition to preparing for that firm a "Handbook of Electrical Methods" and "Electric Car Maintenance."

Mr. G. R. G. Conway, for the last four years chief engineer of the British Columbia Electric Railway, Vancouver, B. C., has resigned that position to take up work as general consulting engineer, with offices in Toronto. In connection with his new engineering work Mr. Conway has been appointed consulting engineer for the British Colum-

bia Electric Railway. Mr. Conway's term of service with this company covered a period of very rapid development, during which he carried out for the company many large undertakings. Among these were the construction of the great dam at the outlet of Lake Coquitlam; the enlargement of the company's existing power house on the North Arm of the Inlet, and the construction of the new No. 2 power house, increasing the output of the Coquitlam-Buntzen hydraulic project to more than 85,000 hp.; the construction of a 130-ft. dam on the Jordan River, Vancouver Island, and the consequent enlargement of the Jordan River power plant to a capacity of 20,000 hp.; the construction of a steam auxiliary plant at Brentwood Bay; the enlargement of the Vancouver steam auxiliary plant, and the laying of many extensions of lines on both the mainland and the island. Mr. Conway received his early training in Great Britain. There he was connected with many large engineering projects and performed important work for the cities of Birmingham and Aberdeen. Later he went to Mexico, where he carried out engineering projects for the Monterey Railway, Light & Power Company. Mr. Conway is a member of numerous engineering organizations in Europe and America, and has contributed many valuable addresses and papers for the records of these societies. The retirement of Mr. Conway was marked by a dinner tendered him by officials of the company at the Hotel Vancouver, Vancouver, on June 26. Mr. George Kidd, general manager, presided and read a cablegram from the London board expressing regret at the retirement of Mr. Conway and appreciation of his work for the company. The office staff presented Mr. Conway with a mounted solid silver rose bowl.

Mr. William A. Del Mar has resigned from the electrical engineering department of the New York Central & Hudson River Railroad to accept a position on Aug. 2 as assistant electrical engineer of the Interborough Rapid Transit Company of New York. Mr. Del Mar has been connected with the New York Central Railroad since 1904, engaged in technical problems connected with the electrification. He has also taken a prominent part in committee work with various technical associations, particularly in connection with standardization, being a member of the A. I. E. E. standard committee in 1914 and 1915, chairman of the 1914 railway standard committee which prepared the Institute's present railway standards, chairman of the 1915 wire and cable committee which is engaged in the standardization of cable stranding, and a member of the 1914 wire and cable sub-committee which prepared the wire and cable standards. He has also been chairman for the past three years of the wire and cable committee of the Association of Railway Electrical Engineers. The specifications of this committee have been adopted largely by the American Electric Railway Association and the American Society for Testing Materials. He has also been secretary of the joint rubber insulation committee and has contributed papers on the question of standardization, as well as upon other subjects, to the columns of this paper and to those of the *Electrical World*. Mr. Del Mar is a native of San Francisco, where he was born on Dec. 15, 1880. He went to Europe in 1887 owing to the desire of his father, who is the author of numerous historical books, to be near the libraries and archaeological collections of Europe. He was educated in France and England, and was graduated in 1900 from the City and Guilds' College of London. After coming to this country he joined the testing department of the General Electric Company in 1900, and in 1902 entered the engineering forces of the Manhattan Railway, where he remained until he became associated with the engineering force of the New York Central Railroad. He is the author of "Electric Power Conductors" and of some of the sections in Penders' "American Electrical Engineers' Handbook" and is a member of the A. I. E. E., the A. E. R. A. and the A. R. E. E., and is an associate member of the I. E. E. of England.

OBITUARY

Louis F. Beckert, a salesman with the Westinghouse Electric & Manufacturing Company, died on July 7 in Pittsburgh. Mr. Beckert was born in Pittsburgh in 1886, and he was graduated from Pennsylvania State College in 1907.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Peoria & Chillicothe Electric Railway, Peoria, Ill.—Incorporated in Illinois to build an interurban railway from Peoria to Chillicothe, 18 miles. Incorporators: E. A. Mitchell, E. V. Mattice, John F. Lynch, Chillicothe, and A. C. Black, Peoria.

***South Brownsville Street Railway, South Brownsville, Pa.**—Application will be made by this company for a charter to construct an electric railway from Brownsville to South Brownsville. Among those interested are W. E. Moore, J. S. Jenks, H. L. Mitchell, D. I. McCahill and E. T. Brashear.

***Mitchell Street Car & Interurban Railway, Mitchell, S. D.**—Incorporated in North Dakota to construct an electric railway. Plans are being made to construct three miles of city line this year. Capital stock, \$200,000. Incorporators: O. F. Cassem and A. N. Hill, Mitchell, and D. N. Hill, Lake Hills, Iowa.

FRANCHISES

Los Angeles, Cal.—The Pacific Electric Railway has received an ordinance from the Council of Los Angeles granting permission to discontinue service and remove the tracks on its Colgrove Line on Santa Monica Boulevard approximately 150 ft. east of the center line on Avery Street; thence northwesterly over private property and intersecting streets, to a point in Vermont Avenue north of Sunset Boulevard; thence northerly along Vermont Avenue to a connection with its Hollywood Line at Vermont Avenue and Hollywood Boulevard.

Bridgeport, Conn.—The Connecticut Company has asked the Council for a franchise to relocate its tracks on North Avenue from North Main Street to Trumbull Road, Bridgeport.

Amherst, Mass.—The Holyoke Street Railway has asked the Council of Amherst for a franchise to extend its tracks on South Pleasant Street to land which the company bought last year for the erection of a new power house and carhouse.

Wakefield, Mass.—The Bay State Street Railway has asked the Council for a franchise to alter and relocate its tracks on Main Street, Wakefield.

Pontiac, Mich.—The Detroit, Pontiac & Owosso Railway has received a franchise from the Council to construct a railway in Pontiac, with the choice of Oakland Street, Baldwin Street, Elizabeth Lake Avenue and Huron Street. [June 19, '15.]

Buffalo, N. Y.—The International Railway has asked the Council for a franchise to lay special tracks on Ohio Street, Buffalo, for the accommodation of travelers on lake boats.

Cleveland, Ohio.—The Cleveland, Akron & Canton Terminal Railway has received a franchise from the Council to construct a subway under East Fifty-fifth Street from the lake to the southerly limits of the city. This is part of a plan to construct a railway from Cleveland along the old Ohio Canal to Dresden. [May 8, '15.]

Columbus, Ohio.—The East Linden Electric Railway has asked the Council for a twenty-five-year franchise for the construction of its line over two sections of the city. The first begins at Hayes Avenue and Leonard Avenue and extends via Hayes Avenue, Mount Vernon Avenue and Champion Avenue to Long Street. The second begins at the corporation line where it cuts Hudson Street, extending west on Hudson Street to Neil Avenue, North on Neil Avenue to Dodridge Street and thence west to the Olen-tangy River. [June 12, '15.]

St. Clair, Pa.—The Eastern Pennsylvania Railways and the Schuylkill Electric Railway have received a franchise to construct an electric railway in St. Clair, which will connect the southern part with the northern part of Schuylkill County.

TRACK AND ROADWAY

Little Rock Railway & Electric Company, Little Rock, Ark.—Plans are being made to widen and strengthen the bridge across the Arkansas River so as to enable it to carry street car traffic. The cost of reconstruction will be about \$290,000, of which the county will pay \$100,000, the railway \$100,000 and the Main Street property owners \$90,000.

Eureka, Cal.—Surveys have been begun on the proposed railway from Eureka to Klamath Falls, Ore., and it is expected that construction will be begun soon. [Feb. 27, '15.]

Pacific Electric Railway, Los Angeles, Cal.—Work has been begun by this company reconstructing its track on American Avenue, Long Beach, from Sixth Street to Anaheim Street.

San Francisco-Oakland Terminal Railways, San Francisco, Cal.—This company will be asked by the West Berkeley Improvement Club to extend its Sixth Street line from University Avenue north to the town line.

Santa Barbara & Suburban Railroad, Santa Barbara, Cal.—Work has been begun on the 2600-ft. extension planned by this company on the "Riviera." The Municipal Improvement Company has been awarded the contract, which includes the first 900 ft.

Connecticut Company, New Haven, Conn.—Work will be begun at once by this company laying new track on East Main Street from Broad Street to the city line and on West Main Street from Maple Street to the city line in Meriden. The company will use 80-lb. rail on East Main Street and 95-lb. rail on West Main Street.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—Material has been received and work will soon be begun on the extension of this company's Washington Street line to Concord Avenue and the Boulevard.

Idaho Railway, Light & Power Company, Boise, Idaho.—The properties of this company have been purchased by the Electric Investment Company.

Urbana & Champaign Railway, Gas & Electric Company, Champaign, Ill.—This company is improving its park and fair ground line, lowering the tracks to a new street pavement level, placing a modern curve at the east end of the park and building a new bridge over a small stream.

East St. Louis & Suburban Railway, East St. Louis, Ill.—Operation has been begun on the extension of this company's Lansdowne Avenue line from Twenty-fifth Street and Lynch Avenue to Jones Park, St. Louis.

Pekin (Ill.) Municipal Railway.—Operation has been begun on the Court Street line of this railway. [Nov. 21, '15.]

Evansville (Ind.) Railways.—Operation was begun on July 4 on the Bellemeade extension of this company's line.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—This company will lay new track on State Boulevard, Fort Wayne, and will move the track in front of the Indiana Home for Feeble Minded Youth from the north side to the south side of the street. Preparations are being made for the paving of State Boulevard. The company will expend \$20,000 on these improvements.

Fort Dodge, Des Moines & Southern Railroads, Boone, Iowa.—This company has purchased its own right-of-way into Des Moines and construction will be begun at once. The company has acquired a strip of land from Swanwood, 1 mile north of the city limits, to Brooks Street, East Des Moines.

Worcester & Warren Street Railway, Worcester, Mass.—The Council of West Brookfield has ordered this company to relocate its tracks on West Main Street to meet the requirements of the town.

Hannibal Railway & Electric Company, Hannibal, Mo.—Work has been begun by this company relaying its tracks on South Maple Avenue from Broadway to Lyon Street, Hannibal, with 70-lb. rails.

Reno (Nev.) Traction Company.—Work has been begun by this company on an extension of its line from Fourth Street to the race track. The branch will not be a permanent line but will be constructed to take care of the heavy traffic during the race meet.

International Railway, Buffalo, N. Y.—Announcement has been made that work on the tracks of this company in Allen Street and Virginia Street for the Connecticut Belt and Hoyt Street car service will be completed within a short time. New rails have been laid, switches installed and the pavement repaired. About \$10,000 is being spent on this undertaking. New track is also to be laid in various parts of the city and a considerable amount of paving work is being done.

New York State Railway, Rochester, N. Y.—The Public Service Commission for the second district of New York has approved the extension of this company's lines from Rochester to Greece to connect the company's tracks with a loop crossing Dewey Avenue, Greece, and crossing the tracks of the Kodak branch of the New York Central Railroad. The tracks will be built for about 1800 ft. from the present terminus of the lines to Little Ridge Road, connect with the Dewey Avenue extension and thence extend by a loop back to the south-bound tracks as now existing. The tracks will run through the center of Dewey Avenue, and will cross at grade Knickerbocker Avenue, Avis Avenue, Pullman Avenue, Steko Street and Palm Street and the tracks of the Kodak branch of the New York Central Railroad.

New York State Railways, Syracuse, N. Y.—This company plans to expend \$200,000 for trackage improvements in Syracuse.

Black River Traction Company, Watertown, N. Y.—This company will lay new double track on its line on lower State Street, Watertown. Wooden ties and stone ballast will be used.

Piedmont Railway & Electric Company, Burlington, N. C.—It is reported that this company may extend its lines to Elon College.

East Village & Harbor Traction Company, Ashtabula, Ohio.—Surveys will be begun at once of this company's proposed line in Ashtabula. In connection with the road a steel and concrete bridge will be constructed across the Ashtabula River at the foot of Main Street. Mark E. Copeland, Cleveland, is interested. [Sept. 19, '14.]

***Cincinnati, Ohio.**—Plans are being considered for the formation of a new interurban traction corporation, its object being to furnish an entrance into Cincinnati for the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad. The distance between Anderson's Ferry, the present terminus of the interurban line, and Third and Walnut Streets is about six miles and it is estimated that the cost of the road will be about \$700,000.

Lake Shore Electric Railway, Cleveland, Ohio.—Work has been begun by this company reconstructing its tracks from the Big Four Railway tracks in Urbana to Crystal Lake Park. The tracks will be lowered from 2 ft. to 3 ft. and a more modern curve put in entering the park.

Oakwood Street Railway, Dayton, Ohio.—One of the tracks being constructed by this company has been completed and work is being begun on the other. The line extends about $\frac{3}{4}$ mile beyond the present Oakwood railway terminus. It is expected that the road will be completed and ready for operation about Aug. 1.

Springfield (Ohio) Railway.—This company has agreed to remove its feed wires from the trolley poles in Main Street between Grape Alley and Wittenberg Avenue so as to free the street from overhead obstruction. The feed wires will be placed in the alleys and across the streets in conduits.

***Henryetta, Okla.**—Plans are being considered to construct an electric railway from Henryetta to Dewar, 3 miles. Gen. Z. T. Sweeney, Columbus, Ind., is interested.

***Ephrata, Pa.**—A movement is being agitated for an electric railway from Sinking Spring via Denver, to Ephrata, where it will connect with lines operating to Lancaster and Lebanon, and at Sinking Spring with a line to Reading. Many landowners are willing to give the right-of-way.

Cleveland & Erie Railway, Girard, Pa.—A report from this company states that it is installing a sample lot of welded splice bars purchased from the Indianapolis Switch & Frog Company to be used in connection with 60-lb. A.S.C.E. rail in paved streets.

Houston, Richmond & Western Traction Company, Houston, Tex.—This company has awarded a contract to the Federal Bridge Company, Des Moines, Iowa, at \$56,000 to construct a bridge over the Brazos River. This is in connection with the company's proposed 30-mile railway from Houston to Richmond. E. Kennedy, Houston, is interested. [June 12, '15.]

Ogden, Logan & Idaho Railway, Ogden, Utah.—Announcement has been made that this company will build a new line from Ogden to Brigham City, taking a shorter route than the present one and tapping a new territory. Surveys have been completed and right-of-way is being secured. Construction has been practically completed on the company's extension to Huntsville.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—A report from this company states that the contract has been awarded for grading and material purchased for an extension of its lines from Springville to Spanish Fork, 6 miles. Work has been begun.

Ohio Valley Electric Railway, Huntington, W. Va.—A contract has been awarded to the Brubaker Construction Company for the construction of an extension of this company's line on Twelfth Avenue, Huntington.

SHOPS AND BUILDINGS

Aurora, Elgin & Chicago Railroad, Wheaton, Ill.—This company announces that about Aug. 1 it will move its general offices from Wheaton to the Hotel Arthur Building, Aurora, Ill. The general offices will occupy the sixth floor and a part of the fifth floor, and the first floor of the building will be used as an interurban passenger station. All the interurban cars entering Aurora will receive and discharge their passengers at this point. These include the Aurora, Elgin & Chicago Railroad, the Joliet, Plainfield & Aurora Railway and the Chicago, Aurora & DeKalb Railroad.

Cleveland (Ohio) Railway.—Application has been made by this company to the building department for a permit to construct three buildings and a reservoir at Denison Avenue. W. I. Thompson & Son Company has the contract. An office building two stories high and a repair shop are included in the improvements, as well as a boiler and pump house. The cost is estimated at \$84,500.

Corpus Christi Railway & Light Company, Corpus Christi, Tex.—This company reports that plans are being made to construct a new carhouse at Corpus Christi with a capacity for fourteen cars.

Milwaukee Northern Railway, Milwaukee, Wis.—This company has completed its new \$25,000 station on Fifth Street between Wells Street and Cedar Street, Milwaukee. The structure is 70 ft. x 40 ft., one story with basement. The building is of brick, concrete and tile and the interior is finished in tile and quarter-sawn oak.

POWER HOUSES AND SUBSTATIONS

Pacific Electric Railway, Los Angeles, Cal.—This company advises that it is installing two 200-kw. motor-generator sets in its new substation at Corona, which is the terminus of a short line running from Riverside to Corona. It is estimated that the cost of the plant will be about \$20,000.

Hutchinson (Kan.)—Interurban Railway.—This company has purchased a double equipment of Westinghouse 35-hp. railway motors.

Vicksburg Light & Traction Company, Vicksburg, Miss.—A report from this company states that it has recently purchased a new 500-hp. Heine boiler to be equipped with Green chain grate stoker to replace two 250-hp. Stirling boilers equipped with Murphy stokers. The installation will be made about Sept. 1, at its plant in Vicksburg.

St. Louis, Mo.—Morrison & McCall, purchasing agents, Chemical Building, report that they have ordered five 125-kw. Allis-Chalmers oil engines complete with exciters and d.c. generators for use on various electric railway properties controlled by them.

Toledo Railways & Light Company, Toledo, Ohio.—Plans are being made by this company to build an addition to its power plant at Water Street. It is estimated that the cost will be \$2,700.

Manufactures and Supplies

ROLLING STOCK

Dayton & Troy Electric Railway, Dayton, Ohio, is rebuilding a car in its shops.

Toledo & Western Railroad, Toledo, Ohio, has ordered one 60-ton electric locomotive and one steel-body package freight car.

Boston (Mass.) Elevated Railway has ordered three two-way dump cars from the Universal Car & Manufacturing Company, New York, N. Y.

Morrison & McCall, St. Louis, Mo., purchasing agents, located in the Chemical Building, expect to purchase possibly five extremely light cars for their various properties.

Fort Dodge, Des Moines & Southern Railway, Boone, Iowa, will receive two new passenger cars on July 31. One car, which has a side entrance, is for the Boone-Ames line; the other, a larger car, is for the main line traffic between Fort Dodge and Des Moines.

Ogden, Logan & Idaho Railway, Ogden, Utah, noted in the *ELECTRIC RAILWAY JOURNAL* of March 20 as having ordered one 50-ton Baldwin-Westinghouse electric locomotive, is reported as having ordered an additional locomotive of the same type, to be put into service on Nov. 1.

TRADE NOTES

Standard Paint Company, New York, N. Y., has received a gold medal at the Panama-Pacific Exposition for its cement waterproofing compound, "Impervite."

I. R. Nelson's Electrical Manufacturing & Repair Works, Newark, N. J., has appointed A. M. Leacock to represent this company in the electric railway field. Mr. Leacock has had extensive experience in the manufacture of field and armature coils, both in electric railway repair shops and with manufacturing concerns. He recently resigned as superintendent of the Electric Operations Company, Inc., where he had complete charge of the field coil department.

Electric Specialties Company, North East, Pa., has been formed for the purpose of manufacturing electric machinery and repair parts, such as commutators, trolley wheels, line material, copper, bronze and brass castings, and drop forgings in copper and steel. The plant at North East is of brick and steel construction and occupies 15,000 sq. ft. of floor space. The officers of the company are: President, G. E. Pierce; vice-president, F. B. Moorhead; treasurer, O. C. Hirtzel; secretary, N. P. Fuller.

O. T. Hirtzel, who severed his connections with the Westinghouse Electric & Manufacturing Company on Feb. 1 has been appointed treasurer of the Electric Specialties Company, North East, Pa., a new corporation described elsewhere on this page. Mr. Hirtzel has been with the Westinghouse Company since 1912 as railway supply specialist of the detail and supply department at East Pittsburgh. Prior to that he was treasurer and manager of the Eureka Company, formerly the Eureka Tempered Copper Works, since the formation of that corporation nearly twenty years ago.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has received an order to equip with No. 307-V four-motor equipments and control the six cars recently ordered by the New York & Long Island Traction Company. Except for the fact that the new motors will be of the ventilated type they will be duplicates of the No. 307 motors now in service and therefore will enable the mechanical department of this company to benefit by the interchangeability of parts of the new with the old motors. The Westinghouse company has also received an order for ten a.c. two-motor equipments which are duplicates of the present No. 409 motors.

Archbold-Brady Company, Syracuse, N. Y., reports the sale of structural-steel towers for 28 miles of transmission line to be built by the Iowa Railway & Light Company, Cedar Rapids, Iowa, between Blairstown and Tama, Iowa. This will be a 66,000-volt, single-circuit, three-phase transmission line on suspension-type insulators. 48-ft. A-frame towers constructed on 440-ft. standard spans with lace-chan-

nel poles at special locations and square towers for anchoring line ends and at heavy angles will be used. The transmission line will be steel-reinforced aluminum with steel ground wires. This order was placed by S. C. Dows, purchasing agent, and J. M. Drabelle, electrical engineer.

ADVERTISING LITERATURE

Drew Electric & Manufacturing Company, Indianapolis, Ind., has issued a folder describing its new cable insulator and splicing sleeve for underground cables. When used as an insulator in the cable sheath, this insulator, it is said, will destroy the conductivity of the sheath by dividing it into short sections and prevent it from collecting current from earth and underground structures. When used as a splicing sleeve it eliminates the danger of leakage at the splice, as the insulator will stand up against any voltage.

Lincoln Electric Company, Cleveland, Ohio, has issued a booklet on the subject of electric arc welding. This gives an excellent description of the principles involved in welding of all kinds and devotes special attention to autogenous welding with the electric arc, an analysis being made of the cost involved, both for labor and for power to produce the arc. Detailed accounts of the methods of welding various pieces of apparatus are included, together with a description of the Lincoln arc welder which is manufactured by this company.

Mitchell-Rand Manufacturing Company, New York, N. Y., manufacturer of all kinds of wax, pitch and asphalt compositions, has issued a folder describing the Columbia or "drop" method and the Kraemer and Sarnow method for testing the melting point of these substances. The difficulty in taking the melting point of such materials as mentioned above, which do not crystallize on solidifying, is the fact that there is no line of demarcation between its solid state and its liquid state. This company has endeavored, therefore, to standardize its tests so that a desirable uniformity on the various products is maintained and the user will have a standard on which to base comparisons. The folder illustrates the apparatus and describes the methods for ascertaining melting points in a way which would make recourse to a chemist or a technical expert unnecessary.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has just issued a booklet entitled "Results of Electrification" in which the history of electric operation on steam railroads is outlined briefly, descriptions of a number of the more important electrified lines being given. These descriptions are grouped under general headings covering installations for tunnels, terminals, trunk lines, mountain grades, switching service and for railroads having relatively light traffic, such as is found on the larger interurban systems. The booklet is elaborately illustrated and contains a number of tables covering important data upon the various systems described. It concludes with an interesting diagram showing the cumulative shipments of electric locomotives on a tonnage basis by the Westinghouse Electric & Manufacturing Company from 1905 to 1914, the curve showing a comparatively steady increase from an insignificant total in 1905 to approximately 24,000 tons in 1914.

COMPANY MAY NOT ABANDON LINE

The Public Service Commission for the Second District of New York has refused to permit the Empire United Railways to abandon its line from Oswego to Seneca Hill on the east side of the Oswego River. The application is the second which the company has made to the commission since it constructed its line through Minetto to Oswego on the west side of the river. Though Commissioner Irvine finds that the population along the east side of the river is not sufficient to make the operation of the line pay, it is decided that the road should be operated for the accommodation of the residents of Seneca Hill until the proposed bridge across the river from Seneca Hill to Minetto is completed. The order of the commission suggests that the cars might be operated at a forty-minute headway or less the year round. The company receives permission to renew the application as soon as the new Minetto bridge is completed, as at that time the residents of Seneca Hill can be as readily accommodated on the west side line as on the present east side line.

No. 5

WHY RUSH-HOUR ENERGY COSTS MORE

The rather disappointing increase in energy unit cost in Chicago, noted in a reference to the recent report of the Board of Supervising Engineers on page 138 of last week's issue of this paper, emphasizes the unfortunate effect of rush-hour traffic on the power station load factor. In Chicago between 1909 and 1913 the cost of energy rose from 0.711 cent to 0.742 cent per kilowatt-hour, although the consumption increased more than 68 per cent. In the same period, however, the statistics show that the average load factor for the year decreased from about 55 per cent to about 45 per cent. It costs more to generate energy for rush-hour service for the same reason that rolling stock and labor cost more per car-mile when used in intermittent service. Power plant equipment must be provided for the maximum demand no matter how short the duration of the demand may be. A typical load-duration curve printed on page 422 of the issue of the *ELECTRIC RAILWAY JOURNAL* for Sept. 5, 1914, shows that with a 30,000-kw. plant installed in Rochester, N. Y., the load is above 20,000 kw. for but 450 hours per year; it is above 16,000 kw. for but 3000 hours, and above 12,000 kw. for but 5500 hours, while only 4000 kw. of load continues throughout the year. J. C. Parker, electrical engineer of this plant, estimates the annual cost of the extra generating and distribution equipment needed to supply the short-duration load at \$750,000, or about 50 cents a kilowatt-hour, with no allowance for fuel, labor, etc. This is worse than the relative cost of the traditional amateur gardener's cabbages.

ENERGY COST AND LOAD FACTOR

The purchaser of electrical energy is apt to think of it as a commodity to be purchased at a more or less uniform price per kilowatt-hour in given quantities. Of course, he ordinarily expects to, and does, get the energy more cheaply in large quantities, but as has been seen this is not a necessary result. Whether a company generates its own power or buys it, the cost will be determined partly by the "when" factor and partly by the "how much" factor. This is true of the small customer's demand, as well as of the demand by the large customer, although the principle with small customers is still being but grudgingly accepted. The Chicago Surface Lines' contract, involving as it does such enormous monthly charges, about a quarter of a million dollars, is undoubtedly as scientifically drawn a contract as is possible. While its application to such an extreme case was not contemplated, it is interesting to inquire what it would show if the load were of 100

per cent load factor. By the method outlined in last week's abstract a simple calculation shows that if the present annual consumption, divided according to the relative requirements of the surface line companies in the proportion given in the report, could be used at a uniform rate the cost would be about 0.57 cent per kilowatt-hour. The difference from the actual cost of 0.74 cent, 0.17 cent, or nearly 30 per cent increase over the theoretical minimum, is due to the poor load factor and measures the cost, to the railway company, so far as power is concerned, of the irregularity of its traffic. In Chicago the demand charge is determined from the average of six hours' load taken from the morning and evening peaks on three successive days, provided that this is not less than previous demands similarly determined and that it is the maximum average which can be obtained by the given method during the month. For each extra kilowatt of demand the price averages about \$1 per month and the price of the corresponding kilowatt-hour is very high because the load peaks are of short duration.

ELECTRIC ROADS RANK HIGH IN PUNCTUALITY

An appropriate obituary of the old joke about the chronic irregularity of trains appeared recently in the editorial columns of the *New York Evening World*. In order to show the improvement made by the railroads in running trains on time the editorial quotes figures issued by the Public Service Commission of New York, Second District, which show that of 67,080 passenger trains running on the railroads included by this district during June, 1915, 93 per cent arrived at their division terminals on time, *i.e.*, not more than five minutes late, the New York, Westchester & Boston Railway holding the highest percentage for any one railway of the group, namely, 99.4 per cent. While we agree heartily with the closing recommendation of our contemporary's editorial to "give modern railroading its due" for the high standard of punctuality attained, we think it only fair to add also, "give heavy electric traction its due!" That the Westchester percentage is not a chance figure is shown by the fact that this line averaged 99.2 per cent for twelve months ending June 30, 1915. The high standard of punctuality for electrified roads is not confined to the Westchester alone. The electric divisions of the other lines included by the same Second District territory, *i.e.*, the Hudson and Harlem divisions of the New York Central lines, and those of the New York, New Haven and Hartford Railroad show in the recent reports excellent figures for promptness, the figures in every case being above and

sometimes well above the average for that month. The average number of minutes late per train run by these same lines is also proportionately low, the New York, Westchester & Boston Railway even averaging for the last year under one-tenth of a minute late per train.

THE PUBLIC'S INTEREST IN SKIP-STOP

Time saved for the traveling public may have a rather nebulous value when calculated in dollars and cents. Nevertheless, experience with the jitney has shown beyond a doubt that the average rider considers his minutes spent en route to be no insignificant factor, and on that basis the recently proposed skip-stop plans in Chicago and St. Louis stand as an impressive public benefit. A simple calculation will determine what the latter is. Taking St. Louis, for example, the proposed plan involves the abolition on the routes in question of 720 stopping points, each one of which necessitates a roughly approximate loss of fifteen seconds in acceleration and retardation and in the stop itself whenever a car passes. Upon the assumption that the average stopping point is passed by a car at least 200 times during the course of a day and that the average car contains some thirty passengers, there is a daily saving of 20,000 passenger-hours. Even under a time value for passengers of only 10 cents per hour (a figure that might be otherwise expressed as equivalent to a willingness on the part of the average passenger to pay 5 cents for a ride that could be made in fifteen minutes, although he could get to his destination without expense in three-quarters of an hour) the time-saving value to the public of the St. Louis skip-stop plan would be \$2,000 daily, or \$600,000 per annum. Here is an indirect return to the community that is roughly equal to the amount now paid in taxes to the city by the railway. It seems impossible to imagine that a proposal to increase the tax payments by 100 per cent could meet with public disapproval, yet this attitude, or its equivalent, seems invariably to follow any plan to eliminate stops. Is not this a good subject for a campaign of popular education?

LABOR AND ARBITRATION

Undoubtedly one of the most serious problems now before the electric railway companies of the country is the labor problem. The jitneys have been making inroads into the gross receipts of the companies, but this trouble is generally considered to be temporary. Labor will always be necessary to operate the cars, and labor will have to be paid, and the rate of wages will have to be determined either by mutual consent or by some outside authority, like an arbitration board. But, as we said last week, the whole tendency of arbitration boards in labor disputes is to compromise. Either the board exactly "splits the difference" between the rates proposed by either side or it declares in favor of some intermediate scale between the two schedules presented to it for consideration. The practical result of the action is serious because the company rarely, if ever, goes before the arbitration board with an offer of less

than the existing wages while the demands of the men are always for a large increase over the existing wages, undoubtedly with the expectation of a compromise decision. The consequence is that the rate of wages is constantly going up. Where is it to stop?

Recent decisions of arbitration boards avowedly ignore as essential factors in establishing a reasonable wage both the financial ability of the company to pay higher wages and the existing conditions of the labor market. The former principle was distinctly stated in the Bay State Street Railway award as published in our issue of June 26, and in the Chicago decision, testimony that plenty of labor could be secured at the existing wages and that they were 50 per cent higher than those paid in many of the skilled trades in Chicago, as well as higher than those paid for the same work in other American cities where the cost of living was greater, made no difference in that award. Even if one should admit, for the sake of discussion, that the increase given in Chicago was warranted, what is to prevent the use of the same arguments (or lack of arguments) to justify another increase of the same amount at the end of the contract period provided arbitration is followed and a compromise verdict only is rendered. This *reductio ad absurdum* of the situation only emphasizes the importance in all arbitration cases of some method which will secure a decision on the merits of the case.

Some suggestions may be obtained from the experience of the steam railroads which have been through a somewhat similar experience in their wage adjustments with the various brotherhoods, but as they are interstate corporations, federal influence and legislation have been important factors in the methods employed and the results obtained. The first most important federal legislation on the subject was the Erdman act. This act provided for two permanent mediators, the commissioner of labor and the chairman of the Interstate Commerce Commission, who were empowered to settle the matter by mediation if possible, but if they found this beyond their ability, they had authority to appoint the third member of an arbitration board if the contending parties could not agree on one. This general plan was duplicated in 1913 by the Newlands act, which also provides for mediation by a federal government board but with three members, or, if the board is not successful in settling the controversy, of an arbitration board selected much like that under the Erdman act, except that if both sides prefer it can consist of six members, two representing each side and two to be impartial.

The practical workings of all of these methods, as well as of the Canadian Industrial Disputes Board and of compulsory arbitration in New Zealand, were discussed in a paper at the last meeting of the American Economic Association by Professor Dixon of Dartmouth, who gives his preference to a permanent federal mediation board acting somewhat under the procedure followed by the Canadian Industrial Disputes Board. The method of selecting "arbitrators" will be mentioned later. According to Professor Dixon, mediators and arbitrators in wage disputes should be experts not only

in the questions involved, but with experience in the proper procedure in the cases which come before them. From such men mere compromises should not be expected. Moreover, from the successful experience with mediation, as administered by Judge Knapp and Dr. Neill under the Erdman act, he expects more successful results than if there was entire dependence upon arbitration.

Of course with any permanent board everything depends upon the personality of the officials engaged. The chief objection to a permanent board, according to Professor Dixon, is the fear of the employers that it will "get into politics" and of the employees that it would fall into the hands of the employing class. He admits that it is natural to expect that any permanent body of arbitrators would quickly become unacceptable to one side or the other or both, but mentions with seeming approval the suggestion of Professor Shortt of the Canadian Civil Service Commission, who has served as chairman of a number of railway arbitration boards, that three or four persons be named by the government as constituting a panel of eligible persons from which the chairman of each board must be selected. Nevertheless he hopes, also from the experience of Canada, that the "investigators" could often bring about a settlement without resort to arbitration. They should, as under the Canadian plan, have the power to forbid strikes and lockouts during the period of investigation, and the publication of their findings should be an important influence on public opinion. In conclusion, he emphasizes the importance of some sort of co-ordination between such a board and the Interstate Commerce Commission so that rates, if necessary, could be increased to compensate for increased wages.

It is obvious that a plan such as outlined is much more easily adapted to interstate roads and a federal form of government than to intrastate roads and a number of state governments. Nevertheless it is helpful to know the evolution through which steam railroad arbitration has passed as well as the directions in which it has broken down and in which developments may be pending. It would probably be unwise to attempt to add the duties of wage regulation to the state public service commissions, but in an industry in which the amount paid for salaries and wages is 60 per cent of the total operating expenses, as in the electric railway business, there should certainly be a very close connection between the wage schedule and the rates permitted to be charged, and increases in the former should be reflected in the latter. Finally any way in which the merits of wage disputes can be brought before the public and in which the responsibility for excessive wages can be transferred in part to the public would be a step in the right direction. We believe that with a properly educated public opinion in regard to the merits of such a case there would be much greater willingness on the part of the public to put up temporarily with the inconveniences of a strike provided there was general conviction that the railway company was right in its contention and that the wages paid were adequate for the work performed.

WHY NOT FIX RAIL-WEAR LIMITS?

In our study of the economics of girder and high T-rail renewals, printed elsewhere in this issue, we were led to conclude that to put this problem on a scientific basis, wear limits for the various rail sections must be arbitrarily fixed. While most engineers will agree with this conclusion, difficulty is certain to be experienced in arriving at the allowable per cent of head reduction. Misapprehension regarding the effect of this probably will exist because many will construe the fixed limit of wear as the amount all rail must be worn before it is economical to renew it. Such a conclusion is incorrect, however, since the only purpose of suggesting a limit of wear is to put the economics of rail renewals on a definite basis. Reference to the empirical formula in the article on rail renewals printed elsewhere in this issue, as well as to the curves comparing the annual cost of renewals on a fifteen and thirty year maximum life basis, should indicate the urgent need of fixed wear limits. This formula was designed to test the economy of making rail renewals, and unless rail-wear limits have been fixed, the remaining wear life of any section under investigation cannot be determined.

Some engineers may think that the limits of wear suggested for the three general types of rail sections are excessive, but computations, on both the fifteen-year and thirty-year bases, show that if the limit was 50 per cent, rail renewals would be economical at 33 1/3 per cent head reduction, and if the limit was 60 per cent, renewals should be made when the head has been reduced 40 per cent. Certainly this amount of wear is not excessive, in fact some engineers have adopted these percentages as the limits of rail wear. On the other hand, one must not lose sight of the fact that these curves do not take into account all the factors which may affect the economy of rail renewals. In other words, the conclusion should not be drawn that rails must be renewed when a certain percentage of the head is worn away. Track maintenance may not increase, joint renewals may be unnecessary after the periods assumed, and, finally, heavier and more expensive new rail may be used. If any or all of these factors are present, the curve representing the annual cost of the old rail would not intersect that for new rail at the point indicated. Moreover, limits of rail wear even greater than those suggested seem warranted since the girder strength certainly is not impaired by the amount of head reduction in percentage which this formula would permit.

In summing up we believe that rail-wear limits can and should be arbitrarily fixed for all rail sections and that such limits should only be governed by two factors, safety and economy. Rail-wear limits determined on this basis will permit the economy of renewals to be calculated within reasonable limits. This is all the more important because the present small margin of profit in the street railway business demands scientific management of the strictest kind and the magnitude of the rail investment warrants special attention to its economical use.

Monroe (Tex.) Maintenance Shops

The Southern Traction Company's Shops at Monroe Handle Both 600-Volt City and 1200-Volt Interurban Cars—
The Equipment Permits Much Manufacture to Be Carried On

The new Monroe shops of the Southern Traction Company are up to the high standard of this road, a general description of which was published in the *ELECTRIC RAILWAY JOURNAL* of July 4, 1914. They are modern in every respect. The best engineering practice has been used throughout, and a number of original ideas have been incorporated in their design.

LOCATION

The shops are healthfully situated 4 miles south of Dallas on Trinity Heights. The pleasant location of the shops has helped draw to them some of the most desirable workmen in the community. The prevailing southern breezes blow directly through the main aisle, which runs north and south. Shower baths, wash basins, toilets and lockers are provided for the workmen. Most of the men live in Oak Cliff, a suburb of Dallas,

fifteen minutes' ride from the shops, on the Southern Traction line. Though Oak Cliff is a very desirable place, with cheap rent and low cost of living, several of the workmen have built homes at Trinity Heights, within walking distance of the shops.

The Monroe shops are situated at the meeting point of the Dallas-Waco and Dallas-Corsicana divisions, so that disabled cars may be brought in quickly for repairs. It is also conveniently located with respect to the Texas Traction Company line, which has a terminus in Dallas and which, together with the Southern Traction Company, are under the control of the Strickland-Goodwin Management Association. All heavy repair work to Texas Traction cars is done at the Monroe shops.

Before passing on to a general description of the shops themselves, the protection of the main line and work tracks may be considered. One loop track connects all shop tracks with the main line, which is protected by a switch and short track which would send a runaway car up a slight incline and stop it against a pile of soil. All of the work tracks are protected by Hayes' derails.

GENERAL CONSTRUCTION AND LAYOUT

The shop building is 275 ft. long by 105 ft. wide. The main bay, as stated above, runs north and south. Built of red brick with white concrete cappings and trimmings, the edifice presents a pleasing appearance. The main division walls are of brick, and expanded metal lathing makes the other walls nearly flameproof. All ground floors are of cement. The wooden roof, with tar and gravel covering, and the inflammable contents of the building are well protected by numerous fire hydrants (with hose) located in the building, while a 50,000-gal. steel water tank furnishes water at 70-ft. head.

The west wing of the building, as shown on an accompanying drawing, has two stories. On the upper floor are three general offices, a lecture hall 40 ft. x 62 ft., and a dispatcher's office—the last being located in

Scale 1" = 45 Ft.

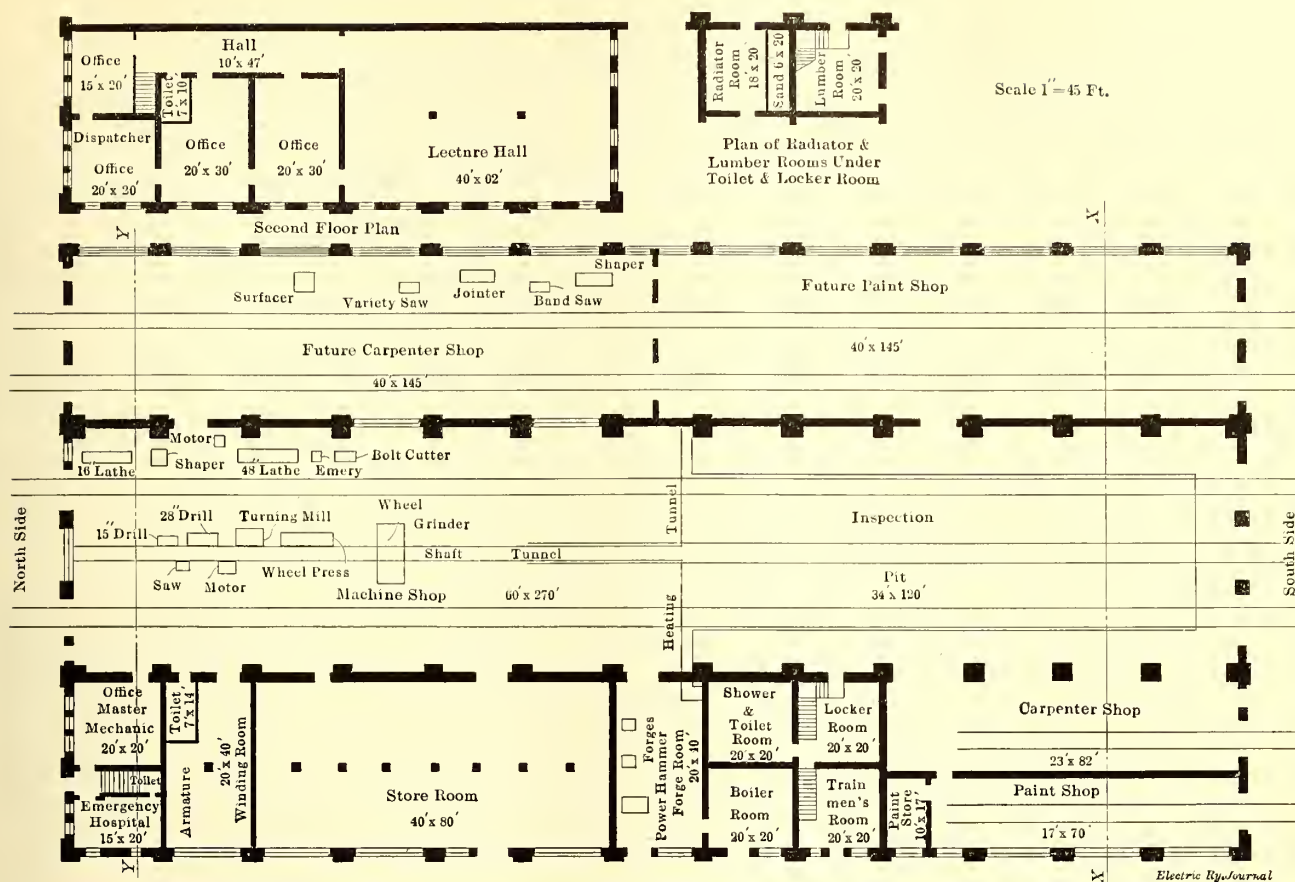

Transverse Section
Y-Y

MONROE SHOPS—CROSS-SECTIONS OF SHOP

MONROE SHOPS—LINE OF MACHINE TOOLS IN MAINTENANCE SECTION

MONROE SHOPS—GENERAL PLAN WITH MACHINE TOOL LAYOUT

the southwest corner where a full view of the main tracks is obtainable.

On the lower floor are the offices of the shop foreman and of the superintendent of equipment. Situated also on the lower floor of this wing are the storeroom, the armature winders' room, the blacksmith shop, the boiler room, a trainmen's room, the carpenter shop and the paint shop. Each shop is separated from the others and from the main bay by brick walls and Durand's tin-clad fire doors.

The storeroom is 40 ft. wide by 80 ft. long, and contains 1000 bins arranged in six double tiers. The black-

smith shop contains two Buffalo forges, fitted with forced draft and suction hoods, the centrifugal fans being electrically driven. The blacksmith shop also contains a 400-lb. Chambersburg hammer operated with air at 90-lb. pressure. The illustration on this page shows a home-made axle straightener and a home-made jib crane, the latter fitted with a 1½-ton Yale & Towne hoist.

The carpenter shop is fitted with a 12-in. patent column hand planing and jointing machine, one variety saw with boxing and hollow chisel mortising attachment and with arbor arranged to receive gaining head, one

MONROE SHOPS—WHEEL GRINDING OUTFIT

MONROE SHOPS—STRAIGHTENING AXLE IN FORGE ROOM

single-cylinder surfer, one 36-in. band saw, one double-spindle shaper, one swing cutoff saw, and one knife grinder and knife balancing machine. Group belt drive is employed. The entire carpenter shop machinery comprising equipment from the J. A. Fay & Egan Company, is run by one 50-hp, three-phase, 2300-volt motor. Natural overhead light is supplied by three wire-glass skylights, each 4 ft. 2 in. wide by 15 ft. long.

In the paint shop, light from above is furnished by two skylights, similar to those in the carpenter shop; and the shop is further lighted on the west side by fourteen windows, each 3 ft. 4 in. x 11 ft. 2 in. Twelve similar windows light the storeroom.

The main aisle or bay is 273 ft. long, 60 ft. wide by 31 ft. from the cement floor to the bottom members of the structural steel trusses which support the roof. These trusses are a combination of the Warren and Pratt types with the top cord slanting to accommodate the roof which slopes from the center toward the sides; these trusses are spaced 21 ft. throughout the length of the aisle. To prevent the trusses from bulging sideways, there are provided three lines of cross bracing,

cars is necessary. The artificial illumination of the shop has been found satisfactory.

INSPECTION PIT AND MACHINE SHOP

Three tracks run the entire length of the main bay. The southern half of the aisle is given over to an inspection pit, 34 ft. wide by 120 ft. long. All rails passing over this pit are supported by 12-in. x 12-in. wooden joists, which rest on concrete posts, spaced every 10 ft. The pit is 4 ft. 10 in. deep; the floor is of concrete 12 in. thick. Two sets of concrete steps, one at each end, afford entrance to the pit. Wooden floors have been put in between tracks and on a level with the rails.

The northern end of the bay is occupied by the machine shop. This contains one 16-in. Lodge & Shipley lathe with patent head and 11-ft. bed, one McCabe 2-in. 26-in.-46-in. lathe with 8-ft. centers used chiefly for turning axles and large commutators and occasionally for wheel work; one 22-in. Ohio machine tool shaper, one single-head bolt threader, one grindstone and an emery wheel. These machines are run as a group, through jackshaft and belts, by a 15-hp. d.c. motor. In

MONROE SHOPS—BABBITTING JOURNAL BRASSES; INTERIOR VIEW OF MACHINE SHOP, SHOWING CRANE

running the entire length of the bay. The high winds that frequently occur in northern Texas make necessary this extra strong roof support.

LIGHTING

The main aisle is lighted by a row of 8 ft. x 3-ft. 8-in. windows, 22 ft. from the floor. These windows extend almost completely around the aisle, there being 103 in all. A few 3-ft. 4-in. x 11-ft. 2-in. windows, 4 ft. 2 in. from the floor, are also provided in the bay near the lathes and mechanics' benches. The aisle is lighted from directly above by five 6-ft. 5-in. x 15-ft. 6-in. wire-glass skylights. The system of natural lighting is found very effective and satisfactory.

Illumination of the main aisle by night is accomplished with ten inclosed arc lamps, hung staggered, in two rows; the globes are on a level with the lower members of the roof trusses to put the arcs out of the direct range of vision for the workmen. Condulet sockets to accommodate incandescent lamps with extension cords are provided wherever close work or inspection under

another group are one 15-in. and one 36-in. Barnes drill press, one 11½-in. Higley cold metal saw with automatic adjustable feed, one 40-in. Bullard boring mill, and a 260-ton Caldwell wheel press. This group is run by a 15-hp, 110-volt, a.c. motor, the jackshaft and motor being located in a concrete pit which is covered by concrete flags. The machine shop also contains one German-made combination splitting shear and punch sold by Henry Pels & Company, New York, and is provided with a riveting hammer and air drill. A Norton wheel grinder driven by a 35-hp, 550-volt, d.c. motor forms an important part of the machine shop equipment.

A 15-ton Box crane, driven by three d.c. motors, serves the entire main aisle, running on rails located 21 ft. 8 in. above the floor. A system of pipes and valves serves all the shops with air at 90-lb. pressure, from a 48-in. x 12-ft. air tank and a 100-cu. ft. air compressor driven by a 20-hp, 550-volt, d.c., series-wound motor. A pipe has also been run over to the Monroe substation, 300 ft. away, where the air is very effectively used in cleaning the machines.

Girder and High T-Rail Renewals

A Summary and Discussion of Existing Practice, the Factors Influencing the Rate of Wear and the Wear Limits, and the Derivation of a Formula to Test the Economics of the Problem

BY EXUM M. HAAS, ASSOCIATE EDITOR ELECTRIC RAILWAY JOURNAL

A wide diversity exists in the practice of making renewals of girder and high T-rail in paved streets. Some railways insist upon strict economy in this regard, while others are grossly extravagant. The diminishing profits of the industry make scientific economy in all departments of utmost importance, but especially in track work, since it represents about 40 per cent of the total plant cost. Traffic conditions obviously will govern the period of renewals, but it is a moot question as to when rail is worn out. This uncertainty is due largely to the fact that wear limits for the different rail sections have not been adopted, although there is no practical reason why one cannot be fixed arbitrarily for each rail section. It may be that this limit would never be reached in service, because of the many other factors entering into the problem, but the mere fixing of a wear limit would place the economics of rail renewals on a definite basis.

Whenever a track appraisal is undertaken the engineer is confronted with the problem of determining the percentage of depreciation. At best, most of these determinations are guesses, based either on the experience of the engineer who makes the appraisal or on precedents set by previous valuations. On some appraisals as large a figure as 8 per cent per annum has conservatively been assumed as the rate of track depreciation, and records indicate that the minimum rate used in any valuation is about $4\frac{1}{2}$ per cent. Information recently obtained after an exhaustive analysis of rail wear in one of the large cities in this country tends to show that an average of thirty-one years of wear life could be obtained. This average wear life, however, was based upon a conservative limit of rail wear which has in some cases been exceeded without affecting track economy.

EXISTING PRACTICE

There is little or no standard practice regarding the limits of wear for the various types of girder and high T-rail. Most engineers who have a definite rule believe that with grooved-girder and tram-girder rails, the limit of wear has been reached when the wheel flanges ride on the floor of the groove or tram. Limits of wear fixed for T-rails are usually based on steam-road practice, or on limits adopted in some important valuation. Perhaps the Boston Elevated Railway has gone as far toward fixing a definite limit of wear for T-rails as any other electric road in the country. Conditions governing the life of T-rail on open elevated structures with high-speed trains, however, are not analogous to the conditions in paved streets where speeds are comparatively slow. The application of steam-road practice to electric railway tracks in paved streets is also in utter disregard of the economics of the problem at hand and results in most extravagant track-maintenance methods. Generally speaking, street railways cannot afford to use relay rails, except in temporary work, on account of the expensive construction employed and the difficulty experienced in making repairs. Some relay rails, however, have been taken from heavy trunk lines and laid in extensions of light traffic lines. Usually such practice is economical only if undertaken at the time of pavement renewals.

Perhaps present-day practice in making appraisals of tracks and in calculating their depreciation is nowhere more typically set forth than in the 1906 report of the Chicago Traction Valuation Commission. In this, track was divided into two parts: the rail and the substructure. Rail depreciation was determined by three principal factors: the wearing life in the head of the rail, the condition of the tram and the condition of the joints. Joints were depreciated on the basis that to obtain the full value in the head of the rail, joint renewals would be necessary. Where the tram was broken the rail wear-life limit was considered as reached regardless of the remaining life in the head of the rail. The wear limit of the rail head was considered as reached when it had been worn away so that the height of the head above the floor of the groove or tram was $\frac{5}{8}$ in. or less. With this wear limit fixed, the remaining wear value of the rail was readily determined. Enough measurements of the worn rail head were taken to obtain an average. The $\frac{5}{8}$ -in. limiting dimension was governed by the depth of the standard wheel flange. In other words, the wear limit was fixed at the point where the standard wheel flanges rode on the floor of the groove or tram.

CHANGES IN RAIL SECTIONS INCREASE WEAR LIFE

Since that time new rail sections have been developed in which metal has been added at points where it was needed to prolong the life of the rail. In some cases the limiting factor of the life of the rail has been railway traffic, in others vehicular traffic, in still others corrosion. Provision has been made for these and other factors which might influence the serviceability of the rail in the later sections. The general adoption of the girder-grooved rail as a substitute for the old tram rail with the horizontal wagon-wheel tread is certain, except under extraordinary conditions, to eliminate vehicular traffic as a life-determining factor. The shape of the groove also makes flange riding less hazardous, and the depth of the groove, in many sections, insures a liberal wear value in the head of the rail.

Grooves, correctly designed, should be of sufficient depth to permit maximum head wear before the standard wheel flanges ride on the groove floor. The introduction of rolled-steel wheels, however, has obviated flange riding as a limiting condition. Comparatively few wheels in service are new, and even a short period of wear increases the wheel-flange depth appreciably. As a result of this, even if the groove depth were correctly designed, one could conceive of rails worn so that all wheels except the new ones would be flange riding. Obviously, wheels worn to the extreme allowable flange depth would ride before the others.

The latest types of girder-groove sections provide a liberal groove width and an angle so that they are self-cleaning. The tendency of one wheel of a pair to wear to a thick flange and the other to a thin flange, as well as for both wheels to wear to thin flanges, results in more or less flange cutting on the lips of the rail groove. Accordingly, the lips of the groove have been made heavier to provide against excessive wear of this kind. Likewise, provision has been made for wear on the gage side of the head due to wheel conditions and the

nosing of the trucks by moving the center of the head more nearly over the center of the web, thereby increasing the horizontal thickness of the head. Some companies (Chicago, for instance) have designed a rail section with additional metal under the head opposite the gage line. This insures a maximum horizontal as well as vertical head reduction before the rail is ready to be scrapped.

Other provisions against the factors which may limit the life of rails include a liberal bevel on the pavement side of the rail head. This not only avoids false treads when narrow wheels run on the track but allows a head area above the normal pavement surface. Some engineers have claimed that the limit of wear will be reached when head of the rail is worn below the original grade of the pavement, and that, consequently, a wear limit based upon any greater percentage than this would allow would be impracticable. Experience seems to indicate, however, that where railway traffic is dense, vehicular traffic also is sufficiently dense to wear down the pavement in advance of the rail. On the other hand, this extra rail-head area above the surface of the pavement insures that at least until the first pavement renewal is made the surface of the rail head will not be below that of the pavement.

In some localities the rapid deterioration of the rail web and base, due to corrosion, determines the life of the rail. Rail corrosion advances very rapidly in some districts, particularly where the drainage conditions are good and the tracks are laid on streets with rather steep grades. This is due principally to oxidization of the steel caused by frequent changes from wet to dry, conditions such as would occur where good track drainage obtains. Here, of course, the life of the rail is not determined by the head, and an increase of the metal in the webs and bases offers the only recourse.

Undoubtedly changes in the chemical composition of rails and in the methods of manufacturing them have improved their wearing qualities. Experience has shown that open-hearth steel rails wear longer than those manufactured by the Bessemer process, and in addition the former have a higher resistance against corrosion. Improvements in the methods of manufacture which have resulted in a more uniform quality and a finer grain have also had a tendency to lengthen the wear-life of rails. On the other hand, modern methods of production under pressure have to a certain extent offset the benefits which should have been derived from improvements in manufacture and changes in chemical composition. An increase in the carbon content has tended to lengthen the wear life of rails. Perhaps the best evidence that changes in chemical composition do improve the quality of the rails is to be found in the service records of titanium-treated rails. While it is possible that other alloy steel rails may produce the same results, actual service data are not available. Apparently rail corrugation which was introduced with the more rigid types of track construction has been eliminated or at least greatly delayed by the titanium treatment. In addition the structural properties, as well as the wearing qualities of the rail, have been improved.

EFFECT OF JOINTS, TIES AND FOUNDATIONS

Although the introduction of the welded and riveted joints has had a tendency to reduce joint difficulties in track, the old adage, "The life of the joint is the life of the rail," still holds, but to a greatly reduced degree. The additional support given to mechanical joints by the modern foundation construction also has made them less of a determining factor than in the earlier types of track laid in paved streets or in open-track ballasted construction. As long, however, as rail is not made

continuous across the joint and a line is perceptible where the rails butt together, it will be impossible to eliminate cupping at that joint. The application of the grinder to insure perfect rail surface on new track and to eliminate evidences of cupping at joints as soon as they appear, is certain to reduce the importance of the joint as a determining factor.

The type of tie used has little effect on the life of rails, although it undoubtedly has some bearing on the problem. Some engineers are of the opinion that the wooden tie, being more resilient than the steel tie, decreases the rate of rail wear, particularly where both are laid in solid concrete. Where soft wood ties are used without tie plates, they may affect the character of wear on the rail. Instances may be cited where rail has canted on soft ties to such an extent as to change the angle of wear on the head. Moreover, mechanical wear on the soft ties may force rehabilitation, which in turn might make rail renewals necessary in advance of the time dictated by rail wear or other track conditions.

If one may draw a conclusion from the rate of rail wear as found in ballasted open-track construction and in paved streets, it would be that the rate of wear on resilient construction is much less than that on rigid construction. If that is a test, then ballasted construction in paved streets should make rails wear longer than solid-concrete foundations. This is a point, however, upon which opinions differ, and strong evidence can be submitted in support of both sides of the question. On the other hand, the permanent types of track foundations have given added importance to the problem of making rail renewals. If there is any economy in the expensive permanent types of construction, and undoubtedly there is, it ought to be practicable to renew rails without any change in the foundations except with possibly some slight repairs. If no more life is to be obtained from foundations of this expensive construction than from those of cheaper construction their use should be discontinued. Experience with the improved types of foundation construction, however, indicates that they will outlive one set of rails. Renewals on old permanent foundations have been made, and will continue to be made, if the foundations have been properly designed and installed.

CHARACTER OF PAVEMENT

Probably no other factor is more important in considering the economics of rail renewals than the character of pavement. In districts where vehicular traffic is reasonably heavy, it is probably safe to say that the modern permanent types of track construction will outwear the pavement. Accordingly, when pavement renewals are contemplated the engineer must determine the remaining life of the rail and whether it will be economical to permit the rail to remain in service. With the large investment in the plant and the small margin of return allowed to railway companies at the present time, this question should be decided on a strictly engineering basis. In other words, if the pavement is to be renewed and the remaining wear value of the rail is such as to make it economical to leave the rail in the track until it is worn out, mere sentiment should not govern the final decision.

GRADES AND DRAINAGE

Single track laid on heavy grades wears more rapidly than single track on the level. Similarly, track on ascending grades in double-track construction wears more rapidly than track on descending grades. This is largely due to the unusual tractive effort necessary which may be accompanied by spinning wheels on sanded track. Drainage on grades is not so important, but on level track it is of vital moment and will deter-

mine the life of track foundations. Manifestly, failure in the track foundation has an important bearing on the rail-renewal problem.

FACTORS AFFECTING THE RATE OF RAIL WEAR

Obviously the density of traffic, both railway and vehicular, determines rate of rail-head wear. Closely related to these two are the type and weight of the rolling stock, whether single or double truck, light weight or heavy. The total weight of the car is not so im-

portant, but the weight per wheel is of moment, the rate of wear being directly proportional to the weight per wheel. The kind of wheels, whether rolled steel or chilled iron, as well as the wheel contour, determine the character of wear. When wheel flanges ride on the floors of the groove or tram, some engineers consider that the wear-life limit of the rail has been reached. Others go so far as to permit the wheel flanges to shear the lip off completely before the rail is considered worn out.

If the track is otherwise in serviceable condition, the

9-in. 145-lb. guard rail on curve in Chicago. Original section installed in 1908 and removed March, 1915. Head reduction 46.9 per cent.

9-in. 129-lb. rail from tangent in Chicago. Original section installed in 1908. Templet taken March, 1915. Note vehicular wear on lip. Head reduction 12.8 per cent.

9-in. 129-lb. rail from tangent track in Chicago. Original section installed in 1908 and templet taken April, 1915. Note wear due to canted trucks. Head reduction 29.0 per cent.

6-in. 97-lb. guard rail laid on a slight grade on a 100-ft. radius curve; 22 lb. per yard worn off or head reduced 56.0 per cent.

6-in. 97-lb. guard rail on curve; 0.0 grade; 23.7 lb. per yard worn off or head reduced 76.6 per cent.

6-in. 97-lb. guard rail on a 60-ft. radius curve; 0.0 per cent grade; laid 1902, measured 1910. 49.4 lb. per yard worn off or head reduced 66.1 per cent.

7-in. 80-lb. tram girder rail from Milwaukee laid in 1898 and removed in 1914. Note head and tram wear. Reduction due to corrosion, causing renewal. Head reduction 28.5 per cent.

L.S.—93—206. 9-in. rail removed after twelve years of service. Joints showed same head reduction. Head reduction 49.3 per cent.

L.S.—90—206. Taken out of track in Toledo, Ohio. This rail was laid on a sand foundation twenty-one years ago. In good condition except reduction in web due to corrosion. Head reduction 38.2 per cent.

Inside guard rail L.S.—398—7 in. 108 lb. per yard. Head reduction 50.6 per cent.

L.S.—6—398, 7-in. 108-lb. rail. Same rail as shown in the cut at the left. Section taken by sawing rail from end. Head reduction 39.2 per cent.

L.S.—78—225. 6-in. rail removed after fourteen years' service. Joint failure cause of removal. Head reduction 19.7 per cent.

L.S.—100—239, worn out guard rail taken from 40-ft. radius curve, which carried 150 cars daily for twenty-one years. Head reduction 40.7 per cent.

tremendous investment in the modern types of track as compared with the small investment in wheels, should dictate the turning down of the wheel flanges to eliminate them from the realm of limiting factors. From the standpoint of safety there is no objection to the practice where rolled-steel wheels are used, because their flanges do not chip, and when these wheels begin to become flange bearing, the deep flanges wear off so that the wheels are soon equally flange and tread-bearing. Experience in the past with chilled-iron wheels seems to indicate that it would not be good practice to allow them to ride on the flanges. However, a change in the shape of the wheel flange might permit this practice so that the mere fact that chilled-iron wheels were used would not make them a limiting factor in the rail-wear life. Even with chilled-iron wheels, the problem should be determined on a safety-of-operation basis rather than simply because the flanges are riding. In cases of this kind it might be economical even to change the shape of the wheel contour to permit the rail head to wear to its limit.

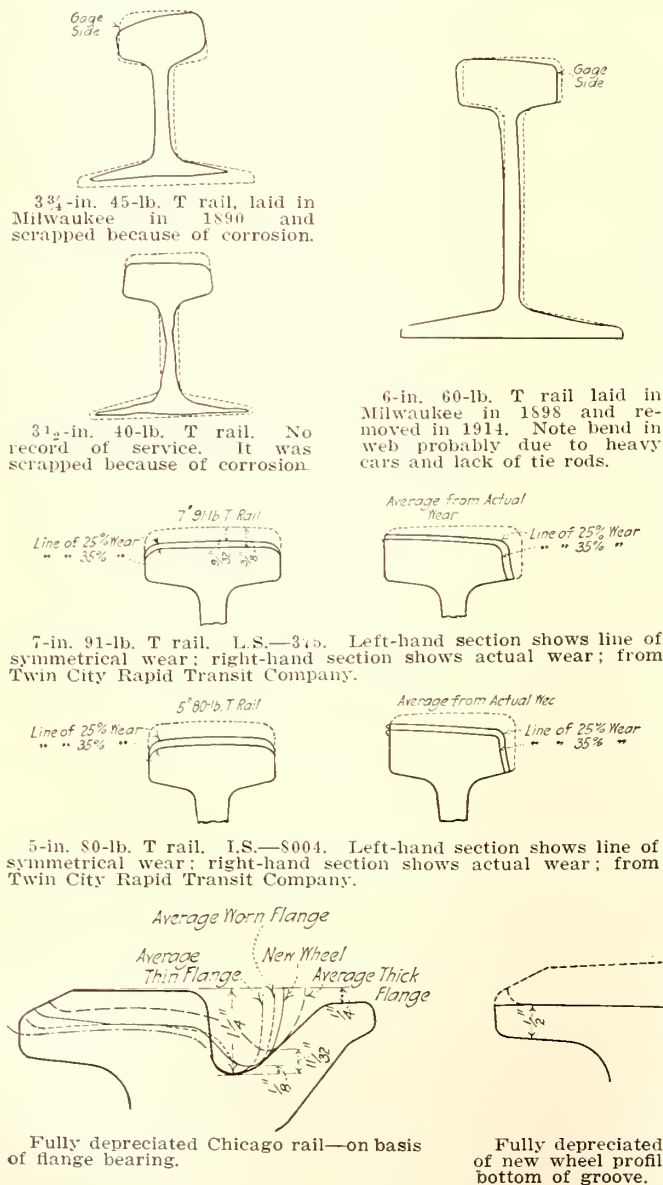

The rate of speed is of vital moment, and for track in paved streets it is safe to assume that the speeds are comparatively low. In other words, they are not comparable with open track on an elevated structure, nor with track on a private right-of-way. But as low

speeds reduce the stresses in the rail it appears reasonable to draw the conclusion that the limit of wear for rail in paved streets may exceed that for rail in open-track construction. Since conditions are not analogous, the practice on steam railroads, interurban railways or elevated railways should not be an index of rail renewal requirements in paved streets. Moreover, the large investment in the types of track construction used in paved streets is sufficient reason to induce the prudent engineer to make every effort to obtain long wear life.

Rapid acceleration and braking increase the rate of rail wear. Equipment maintenance, particularly as regards the condition of the trucks and wheels, also affects the wear life of rails. The flexibility of the car springs and the ease of movement of the side bearings, so far as they affect the position of the trucks and wheels in relation to the rails, also affect the rate of wear. Wheel maintenance in particular is important, as well as the selection of wheel contours which insure a distribution of the load across the full width of the head. Where flanges are permitted to wear unusually deep, wheels may become flange riding long before they should. When flange riding occurs it results in wear in the groove and when the groove is worn through the wear-life limit of the rail should be considered as reached. It is, therefore, important that the limiting depth of the flange should be within reason. Some question has been raised concerning reduction in electrical contact on flange riding track, and this, too, is important in obtaining economical power consumption. On the other hand, the mere fact that the electrical contact is not good should not determine the life of the rail, but should dictate better wheel maintenance.

OTHER FACTORS AFFECTING RATE OF RAIL WEAR

Numerous other elements have a minor bearing on the rate of rail wear, such as the cleanliness of the streets, the weather, the amount of snow and ice, and

Allowable wear of T rails before renewal on the Boston Elevated Railway.

SECTIONS OF WORN RAILS FROM DIFFERENT ROADS, SHOWING HEAD REDUCTION (1/4 size)

SECTIONS OF FULLY DEPRECIATED CHICAGO RAIL (1/4 size)

street sprinkling. Lack of cleanliness causes a collection of grit on the rail which increases the rate of wear. Frequent alternation of wet and dry periods increases the rate of corrosion and produces slippery rails, making the use of sand necessary. Both the corrosion and use of sand increase the rate of wear on the rail head. During winter months the amount of snow and ice is also important, because in some cities it is necessary to use great quantities of salt which gives impetus to both the rate of corrosion and wear. The amount of snow and ice also increases the number of slipping and grinding wheels, although these are of minor importance in influencing the rate of wear.

MUNICIPAL REQUIREMENTS

In many cities railway companies are usually required to renew their track when changes in the grade or the line of streets are made. When changes like these kinds are contemplated the problem resolves itself into one of track economics, together with what character of construction future traffic will demand. These elements enter into most any rail-renewal problem, consequently

RAILWEAR ECONOMICS—LIMIT OF WEAR OF L. S. 95-297, ADOPTED BY INDIANAPOLIS TRACTION & TERMINAL COMPANY (1/2 size)

the decision must depend upon the engineer's previous experience, as well as his ability to anticipate traffic conditions. It seems reasonable to assume that he may make these determinations within safe limits, yet how well it is done depends largely on the human equation. It is believed that rail renewals in cases of this kind do not deserve as serious consideration as the character of foundation to be employed. With the more permanent types of foundations it is safe to assume that rail renewals may be made without disturbing the foundation. If the alignment or grade is changed a loss is entailed in the investment, because the original foundation cannot be used. In contrast with this the rail may be used in the new line or on the new grade or transferred to an entirely new location. These considerations also enter in changes from single to double track.

THE ECONOMICS OF RAIL RENEWAL

When pavement renewals become necessary or the foundations, ties or joints have failed, the question is

usually whether it is economical to use the old rails in the new work. This problem must largely be governed by local conditions and in specific instances. Before the economy may be determined, however, it is necessary to assume some wear-life limit. With a limit fixed the remaining life of the rail may be estimated readily by obtaining the average head reduction for the period the rail has been in service. With this information in hand the rate of wear per year may be ascertained and the remaining life estimated. When this has been done the condition of the joints, ties and the foundation should be carefully examined, as well as the extent of corrosion and the condition of any other part of the structure which may have a bearing on the remaining life of the rail. If the amount of corrosion indicates that it may limit rail life in advance of wear, the rate may be determined in a manner similar to that employed in calculating the rate of head wear.

If the foundation must be rebuilt or if the ties must be renewed, they increase the cost of the installation and may show that it would be uneconomical to use the old rail. The condition of the joints, whether good or in need of repairs or requiring that a permanent type be substituted for the mechanical joint, affects the economy of renewal. When the problem can be decided solely on the basis of economics, it resolves itself into one of balancing interest, depreciation and maintenance of the new rail against the old. The following factors must enter the problem to obtain the comparative annual cost between the old rail and the new:

R_2 = Total cost of new rail, joints and fastenings in place in dollars.

L_2 = Total estimated wear life of the new rail in years.

M_2 = Annual maintenance cost of the new rail in dollars.

P = Annual interest and taxes on the new rail in per cent.

V_r = Remaining wear value of the old rail in dollars.

S = Scrap value of the old rail in dollars.

K = Cost of replacing the old rail in dollars.

T = Cost of tearing up and relaying the pavement, including labor and material, in dollars.

M_1 = Annual cost of maintaining the old rail and fastenings in dollars.

L_1 = Remaining wear life of old rail in years.

X = Money in dollars expended to prolong the life of rail which could not be charged to maintenance (betterments).

C_2 = Annual cost of the new rail in dollars.

C_1 = Annual cost of the old rail in dollars.

From the foregoing factors the annual cost if old rails are used would be:

$$\frac{V_r + K + T + X - S}{L_1} + M_1 = C_1.$$

The total annual cost if new rails are substituted for the old ones at the time repaving is done, is as follows:

$$\frac{V_r + R_2 - S}{L_2} + (R_2 - S)P + M_2 = C_2.$$

To determine the relation between the annual cost of a mile of new rail as compared with a mile of old at the different ages of the old in service, the following values per mile of single track have been given to the various items contained in the formula:

R_2 = \$6000 (including rail and fastenings).

M_2 = \$100.

P = 8 per cent.

V_r = \$2000.

S = \$1200.

K = \$2000.

T = \$1000.

For the different ages of rail V_r will naturally change. It was also assumed that the new rail was of the same section and of the same cost as the old rail. Although there may be some slight change in the scrap value at the different periods, it was allowed to remain the same in the calculations. The annual cost of maintaining the old rail, or M_1 , was increased 50 per cent for the fourteenth year and 25 per cent for the twelve and one-half year period. After the ten-year period, it was also

30-Year Basis		15-Year Basis	
M_1 = \$100 from 1 to 19 years		M_1 = \$100 from 0 to 12½ years	
M_1 = \$125 from 20 to 24 years		M_1 = \$125 at 12½ years	
M_1 = \$150 from 25 to 28 years		M_1 = \$150 at 14 years	
M_1 = \$200 from 29 to 30 years		M_1 = \$440 at 10, 12½ and 14-year periods	
X = \$450 at the 20, 25 and 29-year periods.			

RAILWEAR ECONOMICS—ECONOMY OF RAIL RENEWAL TESTED BY COMPARISON OF ANNUAL COST OF NEW AND OLD RAILS ON A FIFTEEN-YEAR AND A THIRTY-YEAR MAXIMUM WEAR-LIFE BASIS

assumed that new joints would be necessary on all the old rail. On the assumption that 60-ft. rails were used, an amount of \$440 was added to the cost per mile for joints. Similar assumptions also were made in determining the relation between the annual costs of new and old rail on a thirty-year basis. The results of these calculations for the different periods are indicated by the graphs shown in the accompanying diagram. No general deductions may be drawn from these curves since they apply only to the cases in hand. The method employed, however, is applicable to any case, and the terms of the formula are sufficiently general to determine the economy of making rail renewals under all conditions.

CONCLUSIONS

In the foregoing discussion an endeavor has been made to consider every phase of the rail-renewal problem. As a result of this analysis the following conclusions seem warranted:

1. Rail renewals in straight track are seldom necessary because the head has been diminished by wear sufficiently to reduce the structural strength of the rail so that it will not carry cars safely. Light sections on which considerable wear has occurred, however, may be too weak structurally to be safe or economical under an increase in the weight of rolling stock.
2. Better chemical composition, the addition of extra metal where most wear occurs, improvements in the methods of manufacture, lighter cars and training of motormen in the proper method of acceleration and braking have tended to increase the wear life of rails.
3. The more substantial and expensive track founda-

tions now being laid in paved streets, as compared with the earlier types of construction, make more life from the new types necessary if they are economical. Hence, it should be possible to make rail renewals without disturbing the foundation.

4. Joint failures or cupped rail at joints, followed by destruction of the foundation beneath them, are the most important factors in limiting the life of rails. A high standard of construction and maintenance in this respect is certain to delay renewals due to these causes, and it is quite possible that defects of this kind may be made of secondary importance.

5. In districts with heavy vehicular traffic, pavement renewals rather than failures in the track, force engineers to consider the economy of rail renewals.

6. In districts where vehicular traffic is light, rail renewals are largely governed by foundation, tie or joint failures.

7. The large investment in track in paved streets as compared with the small investment in wheels makes rail renewals uneconomical simply because wheels are flange bearing, unless this condition actually makes operation unsafe.

8. The head cross-sectional areas available for wear in most high T-rails are greater than those of girder-grooved and girder-tram rails.

9. The present practice of making rail renewals on an arbitrary headwear limit basis is in general uneconomical, since the ultimate limit of head wear for most sections, both girder and high T-rails, is seldom, if ever, reached.

10. Ultimate permissible wear limits for the standard rail sections of the American Electric Railway Engineering Association should be arbitrarily fixed, if for no other reason than to simplify calculations of the economy of making renewals.

11. For girder-grooved sections, a 50 per cent head-reduction limit appears to be an entirely reasonable one to adopt, although it will be safe to allow more than this on some sections.

12. For shallow-head high T-rails it appears safe and reasonable arbitrarily to fix the wear limit at 50 per cent head reduction.

13. For the A. R. A. and A. S. C. E. rail sections an allowance of a 60 per cent head reduction is believed to be within safe limits.

14. Unless a rail renewal is required by ordinance the relative economy of using new rail or relaying the old rail should be carefully calculated when pavement renewals are made. With these data in hand engineers will have a strong argument for adhering strictly to the economics of the problem.

15. This study finally leads to the conclusion that the rate of rail wear varies with localities, with streets and even as between blocks. For appraisal purposes an average life may be determined for a given property, but this average should not be applied in depreciating track on any other property.

Coupon Transfer at Exposition Grounds

In connection with the handling of travel to the Panama-Pacific Exposition the United Railroads of San Francisco built a loop terminal at Van Ness Avenue between Francisco and Bay Streets. Passengers who enter this terminal pay fare to a station collector and receive a transfer with a coupon attached. As the passenger proceeds he hands his transfer to a checker who tears off the coupon upon which both date and serial number are printed. This coupon is dropped into a box and serves later to check the cash receipts. The portion of the ticket returned to the passenger is the company's standard transfer form.

Skip-Stops in St. Louis

The United Railways, in Its Application Before the Public Service Commission for Permission to Eliminate Car Stops, Replies to Criticisms of Proposed Plan

The brief that has been presented by the United Railways Company of St. Louis before the Public Service Commission of Missouri in connection with its recently-proposed skip-stop plan states that both in this country and abroad the endeavor has been, as territorial expansion in large cities has increased, to shorten the time of transportation for passengers. It then submits the plan, which is outlined in the following paragraphs, to the end that the whole people of the city of St. Louis may be better served, more quickly transported from their places of residence to their places of business, and vice versa.

About 7000 stops are now made in the operation of the street railway system in the city, and of these stops it is proposed to eliminate some 720. This will permit a saving of time that would be required in the slowing up, stopping and starting of cars at those points, and with the same general speed as is now maintained, it is estimated that from four minutes to five minutes will be saved on every line.

The selection of the stops to be eliminated has been made with reference to their present non-usage or the scarcity of passengers presenting themselves for passage, together with the minimum amount of additional walking distance to be imposed by virtue of the increased distance between stops. Stops are to be made in a systematic manner at alternate streets. At every point where cars stop, a red sign with "Cars stop here," or the equivalent, will be posted, and places where the cars do not stop will be indicated by a blue sign with appropriate letters.

Some idea of the immeasurable benefit that this plan will bring to those who ride upon street cars is obtained when it is considered that the United Railways Company now carries about 1,000,000 passengers per day. Assuming that 25 per cent or 250,000 of these passengers save five minutes per trip, a saving of 20,866 hours per day is made, and if the value of this saved time is estimated at the low rate of 10 cents per hour, the value of the time saved is \$2,086 per day, or \$625,980 for the 300 working days constituting the year.

To this proposal of the elimination of these 720 stops some twenty specific objections were lodged, covering twenty different stops. During the course of an early hearing a committee was appointed by all represented at the proceedings to make an inspection of the stops to whose omission specific objection was made and to report its findings to the Public Service Commission. In this report no general objection is lodged to the whole scheme but rather an approval of the plan. However, the particular stops could be retained if this is found desirable without affecting the whole plan materially.

In addition to the objections to particular non-stop points, there have been some half-dozen general objections to the scheme as presented in its entirety. These objections have come from a labor organization, an association known as the People's League, and one or two individual objectors, of whom one is not a resident of the city of St. Louis.

Criticism of the proposed plan can be classified as follows: (1) Some passengers would be required to walk further; (2) there will be a diminution in real estate values at the affected corners; (3) at the eliminated stopping points the speed will be too great, causing more accidents; (4) the company will get the prin-

cipal advantage of the plan by reason of its ability to take off cars.

As to the first criticism, it has been shown in evidence that the average increased walking distance is about 300 ft., and that this affects only the persons living in the immediate vicinity of the eliminated stops, a comparatively small number. At the rate of 4 m.p.h., which is the average walking rate, 300 ft. will be covered in less than one minute. There can be little hardship in this short walk, and those making the walk will participate in the saving of time due to the elimination. In all large cities where rapid transit obtains, the stations are from three to four blocks apart, this being four and five times the distance between stops in the present proposed plan.

As to the diminution of real estate values, owners of real estate at the different corners have no vested interest in the operation of street railway cars. Their interests are at all times subordinate to the interest of the general public in its transportation facilities. A real estate owner cannot oppose his interest to the interest of the majority of the people. Whether or not street cars will continue to be operated in front of his property is a matter of chance, not of right. But aside from this question the diminution of real estate values is merely a surmise prompted by an overcautious imagination, as there seems to be no real reason why real estate should diminish in value either as to business or as to residential locations.

As to excessive speed, the speed of the cars passing over the non-stop points will be no greater than at any of the other places along the route. The evidence shows that even now one-fourth of the cars passing certain points do not stop at that point either for the reception or discharge of passengers. Therefore, the same condition that obtains now in practice will be put into effect in a more systematic manner.

As to the claim that the company will reap some financial advantage, the complainants have attempted to show that since the time for making the trip will be reduced the company will thus be enabled to give the same service with fewer cars and that there will be a saving in power and in wear and tear upon the cars. If this is true, it is a very urgent reason why the plan should be adopted. No one is bettered by economic waste.

Of course, there is no disposition on the part of the United Railways Company to do anything which would decrease riding on its cars. Its only hope for success is to use such methods as will increase its patronage, which can only be done by appealing to the convenience, pleasure and necessity of its patrons. It considers that in eliminating the stops, it would be doing something to save time of the great majority of its customers. The convenience of the public is its first and only consideration. If this proposed elimination is put into effect the speed at the non-stop points will not be any greater than at present. The time that will be saved will be that consumed in making the proposed eliminated stops.

The following letter from Peter Witt, Commissioner of Street Railways for the city of Cleveland, to Richard McCulloch, president United Railways of St. Louis, was submitted to show the attitude of the people regarding skip-stops in the former community:

"Replying to your letter in reference to the car-stop elimination, I am inclosing several [popular ballot] cards, which will show you the method employed here to put this plan in effect. The votes on every line showed a majority for the change, ranging from three to one on the short lines, to eleven to one on the long lines. We eliminated 47 per cent of the stops. The average distance between stops is 800 ft. We cut the time per

half-trip from two to eleven minutes. The only trouble we met with was from the property owners whose interests were affected. The car riders themselves registered no kicks, and so successful has been the plan that I am positive when I say to you that were we to go back to the old way with the slow time, the kicks and complaints would be many."

Comment in the recent report to the city of Detroit by Barclay Parsons & Klapp regarding the elimination of stops was also cited as follows: "In the earlier days of horse-car service it was not unusual for passengers to expect the cars to stop midway, or even at irregular intervals, along the block to suit the convenience of each individual householder or storekeeper. As the distances became greater and the demand for more rapid service grew, the rule of stopping only at corners became necessary. * * * It is now recognized that rapid transit conditions affect such a large proportion of the traveling public that the inconvenience of the few, in walking short distances or in changing cars to complete their trip, is not only warranted, but necessitated by the growing density of traffic on the highways of our large cities."

Pennsylvania Overhead Line Crossing Specifications

This Subject Has Received the Exhaustive Attention of a Committee Appointed in November, 1914—The Specifications Are Divided Into Nine Sections

As reported by R. P. Stevens, president Mahoning & Shenango Railway & Light Company, to the Pennsylvania Street Railway Association at its May meeting, a joint committee representing the different classes of utilities in interest has prepared for adoption by the Public Service Commission of Pennsylvania, a set of specifications covering the construction at crossings of overhead lines of public utilities. Mr. Stevens was the chairman of the committee of the association on a uniform crossing agreement. The specifications are the work of a committee appointed as a result of a conference held on Nov. 16, 1914, at Harrisburg at the request of F. Herbert Snow, chief of the bureau of engineering of the Public Service Commission. As a result of the discussion at the meeting the following committee was appointed: S. M. Viele, Pennsylvania Railroad; D. B. Heilman, Philadelphia & Reading Railway; J. S. Jenks, West Penn Traction Company; R. P. Stevens, Mahoning & Shenango Railway & Light Company; R. E. Chetwood, Western Union Telegraph Company; J. F. Skirrow, Postal Telegraph-Cable Company; Nathan Hayward, Pennsylvania Bell Telephone Company; J. F. Stockwell, Keystone Telephone Company of Philadelphia; Thomas Sproule, Philadelphia Electric Company; G. E. Wendle, Lycoming Edison Company, and Paul Spencer, United Gas Improvement Company, chairman. Beginning Dec. 1, 1914, meetings were held weekly in Philadelphia until the specifications were completed. In the work the committee had the assistance of a number of other experts.

As stated by the committee, the specifications are intended to cover crossings of overhead conductors of any utility and the overhead conductors of any other utility, or the tracks and right-of-way of railroads. They are, as far as possible, complete for all types of conductors and cover definitely the general requirements at the points of crossings, without stating the type of construction in such specific details as to limit it to any particular method. In its work the committee took under consideration other similar specifications, including those adopted by the National Electric Light

Association in 1911, which specifications were, with certain revisions, later adopted by the American Electric Railway Association; the specifications recently adopted by the Idaho Public Service Commission; those of the Illinois Public Service Commission and the Oregon Railroad Commission; the act relating to electrical construction, of the State of Washington; the specifications of the Pennsylvania Railroad and of the Association of Railway Telegraph Superintendents; the regulations of the Swiss government in reference to electrical installations, and the specifications established as standard practice of the *Verbandes Deutscher Elektrotechniker*.

The new specifications, which, with appendices, cover 165 pages of the size of those used in the A. E. R. A. engineering manual, are divided into nine sections covering the following subjects: (1) Definitions and classifications; (2) construction of power lines up to 5000 volts on crossing communication circuits and power lines up to 15,000 volts when crossing other power lines, also communication lines crossing over communication lines; (3) construction of power lines of over 5000 volts, crossing over communication lines and of power lines of over 15,000 volts when crossing other power lines; (4) "collinear" construction, that is, construction of one line parallel with an existing line, but on separate supports, and so placed in reference to the other that one line will be wholly or in part over the other; (5) construction of communication-line crossings over railroads, based upon specifications of the Association of Railway Telegraph Superintendents; (6) crossings of power lines of all voltages over railroads; (7) construction of overhead lines where crossing under railroad bridges; (8) underground construction at railroad crossings, and (9) appendices containing sag tables and diagrams, wood-pole specifications, various diagrams of line construction details, a method of calculating the strength of double cross-arms, tables of allowable working unit stresses in line construction, details of a typical crossing of a power line over a railroad, and tables of minimum clearances and of wind and ice loads.

From what has been said it is apparent that the recommended specifications contain a wealth of data and that unusual attention has been paid to definitions. The latter is especially important in the case where the recommendations will be used in formulating commission orders.

"The Best Country Bus Route"

The latest recruiting appeal to be issued by the London General Omnibus Company takes the form of a striking and original form of panel bill as illustrated.

This slip, the color scheme of which is a tasteful black, yellow and light blue, is now being brought prominently

**THE BEST COUNTRY ROUTE
OF THE YEAR FOR MEN**

BY BUS TO THE TRENCHES START NOW

RECRUITING PLACARD ON LONDON BUSES

before the notice of London's countless thousands by being displayed conspicuously on the "General" buses, with the result, it is hoped, of further stimulating recruiting and impressing the public at large with the great need there is for an adequate supply of men.

Improving Station Surroundings

When Allen & Peck, Inc., took over the operation of the Annapolis Short Line in 1912 the new management found that the vicinity of the station was hardly in consonance with the fine Colonial atmosphere which makes Annapolis a pleasing reminder of the past. A number of tumble-down buildings not only obscured the view of the near-by Court of Appeals, but gave the approach to the station a most uninviting appearance. It was therefore decided that the rental from the shacks could well be dispensed with as a contribution to civic improvement. The structures were torn down and replaced with turf and flowers with the results illustrated.

Thus the opening of "Short Line Park" not only cleared away several old unsightly buildings but virtually placed the Short Line on one of the main streets of the city and within a block of the group of State buildings. The improvement was in line with the rehabilitation of the Short Line, which included all new passenger equipment consisting of center-entrance all-steel cars, and change in motive power from a.c. to d.c.

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Excellent Progress Is Being Made on the Program for the Convention—Booklets on the Itineraries of Convention Tours Are Being Distributed by Mr. McConnaughy

CONVENTION PROGRAM PROGRESS

While it is still too early to give details of the program excellent progress is being made. A decision has been tentatively made to hold the American Association meetings in the morning and those of the affiliated associations in the afternoon.

Acting on local advice the executive committee has decided to hold the meetings in the building of the Native Sons of the Golden West located at 414 Mason Street. This building is the center of the hotel district and is admirably adapted for convention purposes. The original intention was to hold sessions at Inside Inn.

THE CONVENTION TOURS

As announced on the "Association News" page last week, the itineraries of the convention tours have been distributed. They are contained in attractive booklets appropriately bound in red and blue respectively, the colors corresponding with the titles of the special tour trains. The booklets contain the complete schedules and much interesting information concerning the points to be visited en route. Even photographs of the special trains are included. The "Red Special" booklet is issued with the imprint of the New York Central Lines and the "Blue Special" booklet with that of the Pennsylvania Railroad. The text of both booklets shows that the most scrupulous care has been exercised in providing for every detail of convenience and comfort of the tourists. Both booklets are beautifully illustrated and contain maps in colors. Both contain the schedule of the "White Special," the one-way train, which leaves Chicago on the evening of Oct. 1, reaching San Francisco on the morning of Oct. 4.

Supplementing his statement, quoted last week, H. G. McConnaughy, director of transportation, states that copies of the booklets will be sent to all those who ask for them, such having been already sent to company members of the American and Manufacturers' Associations and to those who requested copies in advance. He directs attention particularly to the arrangement of stops on these tours, which have been designed to minimize tediousness. In the cities through which the special trains will travel the American Association is planning, at the request of the local railway companies, a series of meetings and entertainments which will make the tours an important part of the convention. Mr. McConnaughy predicts that every member who makes this trip and attends the convention will return with new ambitions, new ideas and new knowledge sufficient to return the investment tenfold. He thinks that the opportunity to absorb the spirit of the West, to test its hospitality and to examine its engineering achievements alone are worth the cost. He waxed enthusiastic over the beauties of the expositions at San Francisco and San Diego, quoting Edwin Markham's description of the former as follows: "I have seen to-night the greatest revelation of beauty that was ever seen on earth. I say this, meaning it literally and with full regard for all that is known of ancient art and architecture, and all that the modern world has heretofore seen of glory and grandeur. I have seen beauty that will give the world new standards of art and a joy in loveliness never before reached. This is what I have seen—

the courts and buildings of the Panama-Pacific Exposition illuminated at night."

In closing Mr. McConnaughy directs attention to the notes under the heading "Resourcefulness," which appears on the front page of the *Brill Magazine* for June, raising the query as to the number of resourceful men that are in the railway association and implying an important connection between resourcefulness and attendance at the convention.

ENGINEERING ASSOCIATION STANDARDS COMMITTEE

A largely attended meeting of this committee was held in New York on July 29 and 30 to review the work of the technical committees for the year. The members present were: H. H. Adams, Chicago, Ill., chairman; C. F. Bedwell, Newark, N. J.; C. H. Clark, Cleveland, Ohio; W. G. Gove, Brooklyn, N. Y.; J. H. Hanna, Washington, D. C.; C. S. Kimball, Washington, D. C.; F. R. Phillips, Pittsburgh, Pa.; A. S. Richey, Worcester, Mass.; Martin Schreiber, Newark, N. J., and J. W. Welsh, Pittsburgh, Pa. E. B. Katté was represented by H. A. Currie, New York, N. Y. There were also present by invitation R. C. Cram, Brooklyn, N. Y.; W. E. Johnson, Brooklyn, N. Y.; A. B. Stitzer, Philadelphia, Pa., and Frank Kingsley and H. H. Norris, *ELECTRIC RAILWAY JOURNAL*. Secretaries E. B. Burritt and C. W. Stocks also attended the sessions.

The committee considered in detail the recommendations of the technical committees in so far as they affect the association standards and a number of valuable reports were adopted for approval by the association. The material submitted to the committee showed that a remarkably fine year's work had been done and the engineering manual will be greatly enriched by the results.

Street Railway for Canton, China, Proposed

The construction of a street railway system in Canton is being considered by the provincial authorities, reports Consul George E. Anderson, Hongkong, China, and plans have been drawn for a line connecting the stations of the Canton & Hankow Railway and the Kowloon-Canton Railway, running through a populous section of the city.

The proposed line is projected by General Lung, Military Governor of Kwangtung Province, in connection with Chinese capitalists in Hongkong, and the plans call for the construction of a little less than 6 miles of street railway along a route which will permit the use of a considerable portion of the old wall of Canton. It is proposed to construct the line by means of a company for which the provincial government will furnish half the funds.

Plans for the rolling stock are not yet complete, but the general idea seems to be to buy motors and steel parts of cars abroad, completing the cars in Canton or Hongkong, present high freight rates rendering the purchase of complete cars abroad at this time a matter of difficulty. It is thought that the line as projected can be started with an initial outlay of about \$100,000.

COMMUNICATIONS

Specifications for Gears and Pinions

THE METROPOLITAN WEST SIDE ELEVATED RAILWAY COMPANY

CHICAGO, ILL., July 26, 1915.

To the Editors:

I have been interested in the paper on "Railway Motor Gearing" read by W. L. Allen before the last meeting of the Central Electric Railway Association, an abstract of which was given in the *ELECTRIC RAILWAY JOURNAL* for June 26, page 1201, and in the further remarks by Mr. Allen in the issue of July 17, page 111.

On the Chicago Elevated Railroads very little trouble has been experienced from the breakage of gears, but pinions have caused considerable trouble. As a rule gears remain in service until the wear on the teeth makes their removal necessary. Pinions show widely varying results, some failing shortly after being placed in service and some giving very long life. As reliability of service and elimination of failures were far more important than the value of a few pinions we adopted the policy of installing new pinions at each general overhauling (approximately every 75,000 miles) whether the pinion removed showed any appreciable wear or not. Even this did not eliminate failures on the road, as some pinions failed before making the general overhauling mileage.

We believe that buying gears and pinions under specifications and testing each order will assist in working out a specification and in developing a material which will stand up under the requirements of heavy service. The specification will give us something to work toward. If the first specification does not prove satisfactory, changes can be made. The records of the chemical and physical characteristics of the material and method of treating different lots of pinions will enable the railway companies and the manufacturers to intelligently follow the problem until it is satisfactorily solved.

H. A. JOHNSON, Master Mechanic.

THE CAPITAL TRACTION COMPANY

WASHINGTON, D. C., July 28, 1915.

To the Editors:

I have read with interest W. H. Allen's paper on "Specification for Gears and Pinions" in the issue of the *ELECTRIC RAILWAY JOURNAL* for July 17.

In the last few years the untreated gears and pinions have to a large extent been superseded by two classes of gears and pinions which may be properly classified as "heat-treated" and "case-hardened." When the untreated material was in general use several of the larger companies had specifications for the purchase of gears and pinions, but, so far as I have been able to find out, none of the railway companies have specifications for either the heat-treated or case-hardened gears and pinions, although several companies are preparing specifications at this time.

This was one of the subjects assigned the equipment committee of the American Electric Railway Engineering Association, and a preliminary specification has been prepared to be presented at the convention in October. In the preparation of this specification the committee had the assistance of the manufacturers, and I am informed that they would welcome a reasonable specification. In preparing a specification at this time the question of treatment should be left to the manufacturer and the physical properties which the product is to have after treatment should be specified. The development of the high-grade gears and pinions has been so rapid that it is only reasonable to

expect that they will continue to improve and that a specification prepared at this time will have to be revised from time to time.

In my opinion there is no reason for not having specifications for gears and pinions, but some standard specification should be adopted that could be followed by all the manufacturers.

The purchase of gears and pinions to specification would increase the cost if the specification required the manufacturer to change his method. Care should therefore be taken to prepare a specification that would secure a satisfactory material and not impose any unnecessary hardship on the manufacturer.

The manufacturer would not be relieved by the specification from responsibility for breakage or poor wear, but wherever such did occur an investigation would locate the trouble. Although I am not a manufacturer, I must admit that the manufacturer is not responsible for all of the broken or badly-worn gears. The care of the equipment has much to do with the life of gears and pinions.

As this is a subject of considerable interest at this time, the equipment committee of the American Electric Railway Engineering Association would appreciate the assistance of the members in preparing a standard specification for gears and pinions that could be used by all the member companies. If a standard is adopted it will be an advantage to the manufacturer as well as to the purchaser, and if properly prepared its use should not increase the cost, but might, on the contrary, reduce it.

R. H. DALGLEISH, Engineer of Equipment.

Cause of Thick and Thin Wheel Flanges

BUFFALO, LOCKPORT & ROCHESTER RAILWAY COMPANY

ROCHESTER, N. Y., July 20, 1915.

To the Editors:

In an article published in your issue of May 29, 1915, page 1037, over the signature of M. M. Lloyd of Des Moines, the statement is made that "the principal cause of thick and thin flange wear on rolled-steel wheels is the difference of the wearing quality of the metal in the wheels." In this connection it seems only fair to call to the attention of your readers the conclusions of last year's committee on equipment, along the same line of investigation.

On page 280 of the 1914 proceedings of the American Electric Railway Engineering Association, in the report of the committee on equipment, the committee states: "While the number of wheels included in the reports was not large enough to serve as a basis for any general conclusions, a surprising lack of positive evidence on this point was manifest and the figures seemed to show, so far as they showed anything, that there was not sufficient justification for a strong insistence on mating by carbon content." This conclusion was reached after the examination of records of a comparatively small number of wheels taken at random from among records of service of several thousand wheels of all manufactures. The complete lack of uniformity of performance of wheels of similar chemical composition led to the conclusion above quoted, and it would not be too much to say that any chemistry falling within the limits of the standard specifications of the association has been shown to give good service."

Mr. Lloyd's statement "That it is possible to delay wearing of sharp flanges by checking up the trucks for square and by taping the wheels to be sure that the diameter is exactly the same" seems to contain the real kernel of demonstrated truth in the matter.

The writer has personally known of a number of

cases where phenomenally large mileage was obtained by calipering the wheels without removing them from the car, and placing abrasive brakeshoes against the larger wheels. These experiments, while comparatively few in number, nevertheless seem to demonstrate very clearly that if the two wheels on one axle could be kept at exactly the same diameter throughout their life, and further assuming that trucks were in square and that track curvature was approximately the same in both directions, the wheels could be worn to the limit of wear groove without necessity of turning on account of sharp flanges.

The manufacturers of wheels have done a great deal to perfect their product and have shown a very open-minded policy in dealing with the American Electric Railway Engineering Association, as well as the individual users of wheels, and it would seem that in common justice to them the chemistry and method of manufacture of wheels should not be held responsible for results which are in practically all cases due to the mechanical practice of the user of the wheel.

JAMES P. BARNES, General Manager.

99.2 Per Cent of Westchester Trains Are on Time

The accompanying table shows the remarkable record for punctuality which the New York, Westchester & Boston Railway has maintained during the last twelve months ending June 30, 1915. These figures are based on the monthly reports submitted to the Public Service Commission of New York, Second District.

It will be seen from the table that the maximum percentage of trains on time for any month was 99.6 per cent in March, the minimum 98.4 per cent in April. The average punctuality for the twelve months was 99.2 per cent. The average lateness in minutes per train run varied from 0.23 minute in April to 0.04 minute in February and March.

It will be noticed that from 64 to 90 per cent of the delays are listed under the column headed "waiting for other railroads." This large proportion is due to delays

Month	Trains Run	Trains Late	Trains on Time	Per Cent on Time	Minutes Late	Av. Minutes Late per Train Run	Average Minutes Late per Delay	PRINCIPAL CAUSES OF DELAY, IN PER CENT				
								Equipment	Waiting, Other Divisions	Waiting for Other Railroads	Signals	Other Causes

74,551 627 73,924 99.2 per cent for year.												

occasioned by the opening of a drawbridge over the Bronx River, where the trains of the New York, Westchester & Boston Railway run over the tracks of the New York, New Haven & Hartford Railroad, a condition over which the mechanical and operating departments naturally have no control.

The next most frequent special source of delays, classified as "waiting, other divisions," is due to delay in the interchange of passengers between local and express trains at East Third Street Station, Mount Vernon, where both classes of trains are regularly scheduled through the day to arrive at the same minute and wait for each other's arrival.

One of the chief causes for the excellent showing in punctuality on the New York, Westchester & Boston

Railway is ascribed to the policy maintained of scrupulously examining the defects in equipment or other sources of delay and their causes when they first occur in order to insure that a recurrence of the same kind of a delay will be prevented.

Women Conductors in Glasgow

It is not often that this paper publishes a view of a group of conductors on a transportation system. The accompanying engraving, however, seems to be so interesting as to warrant its publication. A few months ago this paper described the experiment made in Glasgow with women conductors. At first two conductors

GROUP OF WOMEN CONDUCTORS, GLASGOW TRAMWAYS

were put in service, and the result with women has proved so satisfactory that the Corporation Tramways have employed a number of women to take the place of the men who are now at the front during the war. A group photograph of the women conductors employed on the system was taken some time ago, and it is reproduced herewith.

Railway Power Rates in Chicago

On page 138 of the issue of the ELECTRIC RAILWAY JOURNAL for July 24 certain information regarding the operation of the contracts between the Chicago Surface Lines and the Commonwealth Edison Company were published. The prices for energy there quoted, for the years 1910 to 1913 inclusive, were the prices under the old contract. While these were the prices originally paid, the 1913 contract was retroactive and, as adjusted under the new contract, the rates actually paid were as follows: 1909, 0.711 cent; 1910, 0.720 cent; 1911, 0.713 cent; 1912, 0.725 cent, and 1913, 0.742 cent.

Warning to Trespassers

Posters entitled, "Why the Public Should Keep Off the Railroad Tracks," are prominently displayed in the passenger stations of the Michigan Central Railroad. These posters take the form of maps of the railroad system upon which is indicated, by different colored spots, the location of each accident during the year. A key on the poster indicates that spots of one color show that the passengers were injured and spots of another color that the accidents were fatal. The four margins of the poster are taken up by photographs of the different types of trespassers on railroad rights-of-way, and the danger to which they subject themselves.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Some Experiences with Field Control

BY H. M. LLOYD, EQUIPMENT ENGINEER BRITISH COLUMBIA
ELECTRIC RAILWAY, VANCOUVER, B. C.

The British Columbia Electric Railway has in operation field control on eleven passenger, three combination and seven express cars operated usually in two or three-car trains, and occasionally in five-car trains, including a couple of trailers. These cars are run almost exclusively on the 64-mile line between New Westminster and Chilliwack. The equipments per car comprise four Westinghouse No. 333-C2 115 to 125-hp. field-control motors geared 20:57. At present the trolley potential is 630 volts, fed from five substations about 12 miles apart, and the minimum voltage is sometimes 400 volts. It is intended, when traffic warrants the change, to raise the potential to 1200 volts.

The car equipment will be readily adapted for this increase in voltage by changing resistance and control connections.

The track over which these equipments operate has a maximum grade of 2.7 per cent and a maximum curvature of 10 deg., but a large part of the track is level and straight.

The running time between New Westminster and Chilliwack for passenger trains with about thirty stops is two hours and forty minutes and for milk trains about three hours. In operating over the line passenger train speed ranges from 20 m.p.h. on grades and curves to 50 m.p.h. or more on level tangents. The field control is used on the heavy grades and during acceleration periods.

In one test a 106-ton train, comprising two motor cars and one trailer, in regular service averaged 7.8 kw-hr. per mile with a maximum draft on the substations of not more than 1000 amp. On the other hand, a similar train of three motor cars with twelve 75-hp. motors of the same gear ratio but without field control required starting currents as high as 1200 amp. to make the same schedule.

The most marked advantage of field control was shown in ascending the 2.7 per cent grade. This grade is about 4 miles long and includes some sharp curves. With the full field the train under test made a speed of approximately 15 m.p.h. while drawing 720 amp. On changing over to the tap field the current jumped to 920 amp., with a consequent drop of line voltage. The resultant speed was only about 18 m.p.h. A heavily-loaded five-car excursion train with three motor cars will average about 10 to 12 m.p.h. up this grade on full field. Thus it is clear that field control increases the capacity of the line.

Another advantageous feature of field control for us is low speed running through rock cuts and around sharp curves. Here we run economically on tap field with the motors in series at about 18 m.p.h., whereas the old control for the same rate of speed would have involved continual cutting in and out and consequent resistance losses.

In starting trains with field control the acceleration is also much smoother than without it, the change from series tap field to parallel full field being accomplished

without jerking. The low starting speed is found especially useful on milk trains in running up to the milk stands to take on cans.

The maintenance cost of field-control motors and of multiple-unit control is also less than that of other motors because they are not subjected to the strain of excessive starting currents. For the same ton-miles operated the feeder losses and the strain on the substation equipment are correspondingly reduced.

A Hydraulic Bearing-Broaching Machine

BY C. M. FEIST, MASTER MECHANIC SIOUX CITY (IOWA)
SERVICE COMPANY

Increased bearing wear averaging approximately 25 per cent more than that for bearings that are simply turned, is obtained by the Sioux City Service Company's mechanical department through the use of a hydraulic broaching machine. While it was designed primarily

SIOUX CITY HYDRAULIC
BROACHING MACHINE

for this purpose, the machine is also used to press bearings into the solid-bearing type motor housings. After the bearing has been pressed in position a tapered broaching mandrel of the proper size is fitted to the plunger and forced into the bearing. All bearings are babbitted and machined in the usual manner, but in the latter process they are left approximately 1/64 in. under size. After the broaching mandrel has been forced through the bearing the babbitt is condensed so that the diameter is reduced to the correct size.

As shown in the accompanying illustration, the broaching machine comprises a substantially-built frame with a heavy circular bedplate upon which the bearings to be broached or pressed into housings are placed. A hollow plunger fitted to an old air-brake cylinder connected to the shop compressed-air system and the city water supply, furnishes the necessary pressure. City water pressure of 90 lb. per square inch may be obtained, but when more is necessary a small belt-driven hydraulic pump mounted on the upper part of the frame and connected to the cylinder is brought into operation. With this, pressures up to 30 tons or 40 tons are obtainable if required. A gage connected to the cylinder and mounted in plain view indicates what pressure is being used. After broaching or pressing has been accomplished, the plunger is raised to the normal position by cutting off the water supply and injecting air pressure beneath the piston head through a standard motorman's valve. This is a home-made machine which was not very expensive to build and has paid for itself many times over in improved bearings.

A Home-Made Wigwag Signal

BY F. T. VANATTA, CHIEF ELECTRICIAN NORTHWESTERN PACIFIC RAILROAD, SAUSALITO, CAL.

Last year the writer designed a wigwag signal of the type illustrated, of which five have already been installed at crossings on the Northwestern Pacific Railroad. Unlike other wigwag signals, which wigwag only in case of danger, this one has three positions: First, normal clear; second, wigwag in top horizontal position for danger with the apparatus in perfect condition, and third, wigwag dropped permanently to danger if there is any defect in the control apparatus.

ASSEMBLY AND DETAIL OF BLADE OF WIGWAG SIGNAL FOR HIGHWAY CROSSING

There is, therefore, no danger of false clear indications. The sheet-iron stop shield is about 40 in. long and 10 in. wide, and carries for night use two 40-watt lamps in marine fixtures with red outer globes. These lamps burn only during the wigwag period. The mechanism which operates the banner and lights is of the automatic type furnished by the General Railway Signal Company, a short arm with an eccentric thereon having

AUTOMATIC WIGWAG CROSSING INSTALLED AT SAN ANSELMO, CAL.

been added to secure the wigwag movement. This mechanism is operated from the regular track circuits such as are used for ordinary crossing-bell operation, or it may be operated by hand. For example, at Petaluma station, which is located between two signals, a train going one way sets the first signal automatically but must wait for the station master to set the signal at the

outgoing end. At night, however, when there is no station agent on duty these signals are automatic throughout in this operation.

Rejuvenating Overloaded Motors

BY W. P. JACKSON, MASTER MECHANIC SAN FRANCISCO-OAKLAND TERMINAL RAILWAYS

The San Francisco-Oakland Terminal Railways have 380 GE-70 motors in city service on two and four-motor equipments averaging about eight stops per mile on a 10-m.p.h. schedule. These motors are rated at 40 hp on 500 volts, and their mechanical construction and electrical characteristics compare very favorably with some of the more modern type. Up to about four years ago these motors were carrying about 13,000 lb. light with 22:64 gear ratio on 30-in. wheels. Owing to the addition of straight air-brake equipments and fenders, and to the lengthening and rebuilding of a number of cars, the average load on these motors was increased until operating temperatures of 80 to 90 deg. Cent. were not uncommon. Maintenance of armatures and field coils became a serious problem, especially on sixty-eight

WIRE IN PROCESS OF APPLICATION ON FIELD COILS; ALSO ONE COMPLETED FIELD COIL WITH HEATPROOF INSULATION

two-motor equipments on which the weight of body and equipment, exclusive of passengers, had been increased to 34,200 lb.

Thus it became a daily occurrence to have solder thrown off from commutators or bands. In fact, conditions became so acute that a radical change of some sort was imperative. Apparently three courses were open: To purchase new motors of larger capacity; to modify operating schedules to conform more nearly to the capacity of the motors in use; or to rehabilitate the motors themselves in such a manner that existing schedules could be met at a lower temperature in field and armature windings, and otherwise to make the motor as near heatproof as possible. The last course was taken, and for two years the work was carried on during the course of regular maintenance and as a charge against the same.

The bottom handhole plate on the commutator end and the top handhole plate on the pinion end were perforated as closely as possible with 1/2-in. holes. In this way free circulation of air was obtained through the interior of the motor case whether the car was running or standing still. The handhole plate on the pinion end

was provided with a sheet-metal guard over the perforations. While these motors are allowed to run open the year round, we have never had any cases of motor trouble due to the entry of water, street dirt or other foreign substances.

When armatures are rewound, the end windings are left as open as possible. The bands are soldered with pure tin, and the hoods are left off of both ends to allow free circulation of air around the coils and leads to the commutator. Delta tape is used as insulation under the bands on the core and end windings, while the face of the leads adjacent to the brushes receives several coats of a mixture of shellac and metallic brown. This mixture has given excellent results as a resistant to flashing and does not carbonize under high temperature. The same mixture is used as a coating on the bead ring and string band back of the commutator.

After the armatures have been in service from 60,000 to 75,000 miles they are removed during the course of motor overhauling, blown out thoroughly and otherwise cleaned up and placed in an oven for twelve hours at 100 deg. Cent. If the coils are loose under the bands, the armature is rebanded while hot and then dipped in black elastic baking varnish, allowing sufficient time for the varnish to penetrate thoroughly all parts of the winding. The armature is then drained to receive a further baking of twenty-four hours at 100 deg. Cent.

Field coils are wound with No. 3 Deltabeston wire heated in an oven at 100 deg. Cent. and dipped while hot in black elastic baking varnish. After draining and cooling a heatproof plastic composition is smoothed over the outside turns and the coil is served with a half lap layer of pure asbestos-woven tape, 20 mils thick. This tape has good mechanical strength and is drawn very tightly around the windings. The coil is then heated a second time to 100 deg. Cent. and dipped, following which it is served with one layer of Delta tape 20 mils thick and 1 in. wide.

Three screw terminals with copper conducting strips cast in are then fastened to the coil with asbestos twine, the terminals being insulated from the coils with two thicknesses of 20 mils Delta sheeting. The coil then receives a final wrapping of asbestos-woven tape, is heated for the third time, and after dipping is returned to the oven for a baking of forty-eight hours at 100 deg. Cent. All field coils receive the usual transformer tests for "shorts."

Not one of the coils made in the manner described has ever been removed from the motors, and they are standing up under conditions where an ordinary impregnated coil will not last sixty days. The cost of manufacture is \$20 each.

The field connections in the motor case are made with No. 4 flexible strand, soldered into terminals made of scrap No. 0000, solid feed wire turned to $\frac{1}{4}$ in. diameter for the field terminal, with a hole drilled in the full-sized end for the lead wire.

As a further and not inconsiderable help to these motors we are gradually changing the gear ratio in the heavier cars from 22 : 64 to 19 : 67. The installation of armored material has a tendency to hold up the maintenance figure on these motors to a certain extent.

During the year 1912 the monthly troubles on these rejuvenated motors averaged as follows:

Armatures, grounded	21
Armatures, open circuit	15
Fields, grounded	10
Fields, open circuit	5
Fields, weak	25
Maintenance per 1000 motor-miles.....	\$1.30

During the past fiscal year the monthly average of troubles has been:

Armatures, grounded	5
Armatures, open circuit	8
Field troubles (all kinds).....	10
Maintenance per 1000 motor-miles.....	\$0.96

The maintenance given includes gears, pinions, gear cases, armatures and axle bearings, suspension, and all parts of the motor proper. These 380 motors make an average of 1,476,000 motor-miles per month.

Drying Sand in 7-Yd. Batches

Small-capacity sand dryers require more or less constant attention and, while they are entirely satisfactory at carhouses where labor is always available, where this condition does not prevail a man must be detailed to attend to the work. The Sioux City (Iowa) Service Company eliminated this objection in Carhouse C, where the running repair force was only sufficient to take care of the equipment by providing a sand dryer of large capacity when the building was constructed. Aside from its capacity this dryer is unique in several particulars. It is installed in a room set aside for the storage of wet and dry sand as well as the drying plant. This room is oblong in plan and one wall of the sand dryer serves as one side of the wet sand bin, while the other side of the dryer is open so that the dry sand may be cast into the storage space at the opposite end of the room. As indicated in the accompanying illus-

SIoux CITY 7-YD. SAND DRYER

tration, the bin is formed of four 8-in. brick walls with concrete coping, and it is 20 ft. long by $4\frac{1}{2}$ ft. wide over all, and $3\frac{1}{2}$ ft. deep. The floor of the bin is 2 ft. above the building floor and is formed of T-bars, the legs of which support sheet-steel slides. The top of the dryer bin walls is only $5\frac{1}{2}$ ft. above the floor level, hence the wet sand may be readily cast into the dryer. One and one-half-inch steam pipe coils encircle the interior of the dryer and are connected to the building heating plant. Comparatively little sand is used during the summer months, hence steam heat is available when most dry sand is needed.

After the dryer bin has been filled with wet sand, holes are poked into the sand at frequent intervals with a broom handle. These hasten the drying process by permitting the escape of moisture. When the sand is dry the sheet-steel slides are withdrawn and the dry sand falls to the floor beneath the bin. From this point the sand is screened and cast into the dry-sand storage space. From the foregoing it will be seen that the work of casting sand into the bin is one process, and between that and the screening of the dry sand quite an interval may elapse, hence the dryer needs attention only when a 7-yd. batch is exhausted. This type of dryer has been very effective and the cost is relatively low when the dryer is installed at the time the building is constructed. Its principal advantage, however, is that it requires little attention and drying sand in it makes a fine rainy-day job for an outside man.

Long Island Railroad Installs Double Ventilators

The accompanying cuts show in detail the system of ventilation used on the twenty new steel trail cars recently placed in operation on the Long Island Railroad, which were described in the *ELECTRIC RAILWAY JOURNAL* of July 24.

The ventilators, provided for these cars by the Automatic Ventilator Company, New York, N. Y., are of a new design, but embody the well-known "intake and exhaust" principle of this system. This device, known as type "E-B," is installed on the center line of an almost flat roof and consists of an exterior hood,

LONG ISLAND VENTILATORS—BOTTOM VIEW AND CROSS-SECTION

divided into four separate compartments, two exterior deflectors and an interior disk. When the car is in motion air is arrested by the exterior deflectors and directed into the two forward compartments (one on either side) of the hood and thence down to the interior disk, and is deflected outward and upward across the ceiling of the car, where it is sufficiently diffused to prevent a draught on the passengers. At the rear of the exterior deflectors is set up a partial vacuum caused by the rapid motion of the car, which induces a strong "exhaust" at the two rear ports of the hood and at the rear of the interior disk. Each ventilator provides two intakes and two exhausts and is therefore equal to two separate ventilators.

Cleaning Air for Ventilating Generators and Transformers

In the August issue of the *General Electric Review*, William Baum, electrical engineer General Electric Company, directs attention to the importance of cleansing and cooling the air used for the ventilation of turbo-generators and air-blast transformers. This is desirable because the accumulation of dirt means rapid deterioration and frequent cleaning. He considers the requirements of air filters to be as follows: Complete removal of suspended matter, minimum loss in pressure due to air passing through the clean and soiled filtering medium, minimum dimensions, simple construction with means for convenient removal and cleaning of the filtering medium, durable filtering medium which does not require too frequent removal and minimum fire risk. He discusses the available filters with respect to these requirements, describing typical filters of the wet-surface and dry-surface types. Air washers are also discussed with the statement that their prime object is to clean the air, the humidifying function being secondary. The cooling effect of the water is not appreciable. No insulation troubles have been experienced due to the effect of the saturated air upon generator windings. Some fifty-eight air washers have been installed in the United States for the ventilation of generators of an average size suitable for a 10,000-kw. generator. It appears that air washers are used for larger generators, dry-surface filters for small ones, and wet-surface filters for medium sizes. Air washers consist of the following

essential parts: spray chambers, spray nozzles and piping, eliminator or baffle plates, strainer, settling tank and water circulating system with pump. The difference in the various makes is principally in the design and arrangement of the nozzle. Mr. Baum describes a number of typical air washers and gives tables and curves of space required and of unit costs. The space requirements are as follows: Air washers, 0.17 cu. ft. per cubic foot per minute; dry-surface filters, 0.10 cu. ft. per cubic foot per minute, and wet-surface filters, 0.09 cu. ft. per cubic foot per minute. In sizes from 30,000 to 60,000 cu. ft. per minute capacity air washers and wet-surface filters average in first cost about 3 cents per cubic foot per minute, washers being slightly cheaper as the size increases. Dry-surface filters cost about 1½ cents per cubic foot per minute. In all types the unit cost increases rapidly with decrease in size.

The general conclusions are as follows: For generators up to about 5000-kw., dry-surface filters may be recommended on account of low first cost, and if the air is not too dirty, their application is of advantage in dry, cold climates. They require careful attention and handling. Wet-surface filters, which have been found successful in England, have not yet been introduced in this country. Their field of application is for generators above 5000-kw. in size. The tendency toward the installation of large turbo-generator units will undoubtedly increase the application of air washers or humidifiers in preference to other types of air-cleaning apparatus. In dry, hot localities the cooling effect of air washers is appreciable. Special precautions are necessary to prevent freezing in winter.

Easily Applied Hose Coupling

An air, steam or water hose coupling, so designed as not to decrease the area of the hose connection, has recently been placed on the market by the National Hose Coupling Company, Chicago. It is furnished with a malleable-iron hose socket which fits over the hose and which is sufficiently corrugated on the inside to provide a positive grip when the hose is expanded inside it. A steel taper expander screws into the socket containing

HOSE COUPLING WITH SECTION CUT AWAY TO SHOW CONSTRUCTION

the hose and the latter is thus forced outward and into position. The area of the opening in the expander is the same as that of the hose, so that no obstruction to the flow is introduced. Application of the hose connection requires only a few turns with an ordinary hand wrench, and this makes it especially advantageous for use in connection with air-brake hose. The coupling is being manufactured in all standard sizes.

Willy Lamot, Antwerp, Belgium, whose present address is Sharnhighs, Halstead, England, reports the creation of an organization to introduce into Belgium as soon as the war is over all American products and manufactures and to employ as agents, representatives, etc., a number of Belgian manufacturers and business men who are prepared to give the necessary guarantees as agents and dealers.

Compact Arc-Welding Outfit

An arc-welding outfit of the motor-generator type, which possesses to an unusual degree the qualities of compactness and lightness, has recently been brought out by the Lincoln Electric Company, Cleveland, Ohio. It has been designed with the view of establishing distinctive features in economy of power consumption,

simplicity of operation and reliability of service.

These features are obtained largely by the fact that the motor-generator is so designed as to generate at all times exactly the voltage required by the arc and in addition, give a current which is practically constant. In consequence, there is no need for resistance in the circuit to cut down the voltage, and the size and weight of the machine is reduced to the minimum necessary for the work in hand. Regulation is effected by

COMPLETE ARC WELDING OUTFIT

special windings in the generator and by a simplified method of control which is easily grasped in a very short time by any reasonably intelligent operator. This is considered to be of utmost importance as most autogenous welding is done by men who are neither electricians nor mechanics, and since labor is a great factor in the cost of welding the machine ought to be so simple that it is not necessary to have a highly skilled man to do the work.

The Lincoln arc welder has been designed to stand long, heavy duty and to carry overloads without damage to the machine, as emergency service is frequently demanded in arc-welding plants. Every motor-generator is operated in the factory before shipment for five hours under a continuous make-and-break test in which the make and break at the rated output of 150 amp. occurs at least fifteen times per minute, and under this test the temperature rise is guaranteed not to exceed 40 deg. C. in the windings and 55 deg. C. at the commutator. Naturally, this conservative method of rating and the severe service test insures a liberal margin of safety in operation, both under normal and abnormal operating conditions.

Owing to the fact that no power is wasted in resistance banks the demand for current is small, and in ordinary service the Lincoln welder can be operated on any power line large enough to carry a 10-hp. motor. This permits the installation of the outfit at almost any point in a shop where there is a power line, and if desired the machine may be made portable and connected wherever the exigencies of the work demand it. In operation the machine is thoroughly flexible, and any number of them may be operated individually or in parallel. In fact, an operator can, without the services of an electrician, connect three 150-amp. plants in parallel to get 450 amp. for heavy carbon electrode work, and can then individualize the plants within a few minutes' time.

Aside from providing the feature of portability the

small size of each plant limits the expenditure of money invested in welding equipment to a proper basis in proportion to the amount of work that is actually done. Where there is sufficient work to require more than one operator a separate unit is installed. In large railway shops where the time that is allowed to do work is limited and an accident to the welding plant would hold up the rest of the organization, the installation of individual welders serves as a form of insurance against the loss that would be inevitable in case a total shut-down occurred.

Hydraulic Punch for Track Spike Slots

A new hydraulic punch for cutting out at one setting two slots or notches for spikes in flanges of railroad or conductor rails has been brought out by the Watson-Stillman Company, Aldene, N. J. The advantages of this tool are that two holes can be punched at one operation on opposite sides of the rail in exact alignment, thus saving much of the time usually consumed in laying out centers and changing the punch from one side of the rail to the other. The machine makes an efficient tool for use by unskilled labor.

From the accompanying illustration it will be seen that one punch is attached to a chain.

This punch is removed and the tool is placed against the rail. The loose punch is then inserted in place and the punches are then run down to the rail by pinions, meshing into racks on the rams. A few strokes of the pump lever completes the operation, which takes less than two minutes and but little effort. The punches are pulled back by a rack and pinion movement.

The punch is built compactly and is so designed that the greatest strength is obtained with the least weight. Consequently, it may be easily and quickly handled when time is a factor. The working parts are readily accessible for cleaning and the punches and dies are removable, thus providing for sharpening and renewal.

VIEW OF TRACK SPIKE
SLOT PUNCH

Silica-Graphite Paint for Steam Boilers

A practice that is gaining recognition in power plants is the use of graphite paint for the inner surface of steam boiler drums. This is said to afford protection against pitting. For a number of years the manufacturers of the paint have coated the steam drums of five B. & W. boilers developing 1800 hp., and as a result the drums are in almost perfect condition. In another plant equipped with B. & W. boilers developing 8400 hp. the interiors of the drums were scalded, painted both above and below the water line and allowed to dry for forty-eight hours. This treatment was repeated every ten months, and not only was pitting stopped, but where it had previously taken six men seven days to clean the drums of one boiler, two men now clean them in a day. This latter experience is quoted from a letter of the chief engineer of the New York Life Insurance Company, in a recent issue of *Graphite*.

Electric Railway Legal Decisions

CHARTERS, ORDINANCES, FRANCHISES

Idaho.—Regulation of Utilities—Duplication of Electrical Plants.

All property devoted to public use is held subject to the power of the State to regulate or control its use in order to secure the general safety, health and public welfare of the people, and when a corporation is clothed with rights, powers and franchises to serve the public, it becomes in law subject to governmental regulation and control.

Under the State's police power the Legislature has authority to authorize the utilities commission to determine whether a duplication of an electrical plant is required in a town or city for the convenience and necessity of the inhabitants. (*Idaho Power & Light Co. v. Bloomquist et al.*, State Public Utilities, 141 Pacific Rep., 1084.)

Kentucky.—Definition of Interstate Commerce—Reasonable and Unreasonable Municipal Regulation.

The traffic carried on by a Kentucky street railway corporation in connection with an Ohio corporation operating on the Ohio side of the Ohio River, in transporting passengers upon continuous and connecting tracks and across an interstate bridge between points in Covington, Ky., and Cincinnati, Ohio, by means of continuous trips and a single fare, and under practically the same management, is interstate commerce.

The absence of federal regulation does not justify the city of Covington, Ky., in regulating the interstate business of a street railway company principally engaged in transporting passengers from that city to Cincinnati, Ohio, by restricting the number of passengers which the company may admit to its cars to not more than one-third in excess of the seating capacity, except on certain holidays, and by requiring the company to operate sufficient cars reasonably to accommodate the public within the limits of such restriction, where compliance with such regulations will require about one-half more than the present number of cars operated by the company and more cars than can be operated in Cincinnati within the present franchise rights and privileges held by the company or controlled by it in that city.

Municipal regulation of a street railway company, principally engaged in interstate commerce, with reference to passengers riding on car platforms unless the same are provided with suitable rails or barriers, and with reference to the cleanliness, ventilation and fumigation of the cars, does not infringe upon the federal authority over such commerce—at least, until such federal authority is exerted.

A municipal ordinance providing that the temperature of the cars of a street railway company which is principally engaged in interstate commerce shall never be permitted to be below 50 deg. Fahr. must be deemed to be invalid as unreasonable, where the undisputed testimony shows that it is impossible in the operation of the cars to keep them uniformly up to this temperature, owing to the opening and closing of doors, and other interferences that make it impracticable. (*South Covington & Cincinnati St. Railway Co. v. City of Covington*, 35 Supreme Court Rep., 158.)

Massachusetts.—Crossings of Transmission Lines Over Highways—Abolition of Grade Crossings.

Where a railroad right-of-way crosses a public highway the land is subject to both easements, each to be exercised reasonably with reference to the other, and under such circumstances electric wires may be carried over the tracks in a proper way without liability to the railroad company.

Where grade crossings are abolished in accordance with Stat. 1906, Chap. 463, Part 1, Secs. 29-45, the two conflicting easements of the railroad company and of the public in the street are separated, and an electric company authorized to string its poles and wires in the street cannot place its poles over railroad tracks which have been elevated above the street. (*N. Y. C. & H. R. R. v. Central Massachusetts Electric Co.*, 106 Northeastern Rep., 566.)

Minnesota.—Ordinance Requiring Additional Line.

Under the reserved authority of the city to order the construction of new lines of street railway, the city may direct whether a new line shall be a single or double track line, and

defendant possesses under its franchise no vested right or option to determine the character of the line in this respect. (*State ex rel. City of St. Paul v. St. Paul City Ry. Co.*, 149 Northwestern Rep., 195.)

Missouri.—Eminent Domain by Electric Railway—Value of Property for Station Purposes.

An electric railway incorporated under the steam railroad act (Rev. Stat. 1899, Secs. 1034-1174) is entitled to condemn land for railroad purposes, and, if it is an interurban railroad, it has equal right conferred by Laws 1907, page 174.

Where condemnation of land for railroad freight and passenger depot purposes was part of a general scheme previously inaugurated for the construction and operation of the railroad in accordance with a lay-out and plat adopted prior to the construction of railroad buildings on adjoining property, the owners of the property sought to be condemned were not entitled to have any increase in value of their property by reason of the improvement of the adjoining property considered in determining the value of their property for railroad purposes. (*St. Louis Electric Terminal Ry. Co. v. MacAdaras et al.*, 166 Southwestern Rep., 307.)

Nebraska.—Permission Required to Discontinue Service.

When a company has obtained a franchise from the city to construct and operate its railways on certain streets of the city and has constructed its tracks and is operating its cars thereon pursuant to such franchise right, it will be enjoined from removing such lines or withholding its cars from such service without first obtaining authority from the State Railway Commission so to do. (*H. Herpolsheimer Co. et al. (Wolfe et al., Interveners) v. Lincoln Traction Co.*, 147 Northwestern Rep., 206.)

New York.—Certiorari to Review Assessments—Testing Excessiveness of Assessment.

On certiorari to review the assessment of a street railway company's special franchise for taxation, where the State board of tax commissioners in its return stated that it availed itself of all tests of value within its reach and all information bearing upon such value and adopted no certain or fixed rule or method; that it would be impossible to state more definitely the mental operation which prompted it in arriving at the valuation fixed or to state which of the different elements, theories or methods considered most influenced the minds of the individual members, or to what extent each test was used, but that the valuation was finally fixed and agreed upon as the combined judgment of the board, irrespective of the individual methods of arriving at it, it was not error to permit the railroad company to show that the assessment was excessive under the net earnings rule, on the theory that as the board was not bound to adopt that rule, error was not proved by showing excessiveness under that rule, since the assessments were not conclusive but were subject to review, and the courts cannot review the undisclosed and concededly indescribable methods followed by the State board. (*People ex rel. Third Ave. Ry. Co. v. State Board of Tax Commissioners (City of New York, Intervener)*; *People ex rel. Wallace et al. v. Same*; *People ex rel. Kingsbridge Ry. Co. v. Same*, 106 Northeastern Rep., 325.)

New York.—Rights of Transfer Passenger to Travel by Most Direct Route.

A passenger on a street railway car is entitled to be carried to his destination by the most direct route. Hence, where he was accepted on a short service car, which necessitated a transfer to a through car, the company cannot require him to transfer to a parallel line further over, except for some most cogent reason, and a mere statement that such requirement was to avoid congestion and for the convenience of passengers is no reason. (*Goodman v. New York Rys. Co.*, 150 New York Sup., 702.)

New York.—Transfers Required Between Two Allied Companies.

Public Service Commission Law (Consol. Laws, Chap. 48) Sec. 49, Sub. 7, provides that every street service railroad corporation entering into a contract with another such corporation, as provided in Sec. 78 of the Railroad Law (Laws 1890, Chap. 565, as amended by Laws 1905, Chap. 695), shall carry between any two points on the railroads any passenger desiring to make a continuous trip for a single fare, and such corporation shall, without extra charge, give to each passenger paying a single fare a transfer entitling

the passenger to one continuous trip to any point of any railroad embraced in such contract, and for every refusal to comply with the subdivision the corporation shall forfeit \$50 to the aggrieved party. Railroad Law, Sec. 78, provides that any railroad corporation may contract with another for the use of their respective routes and that such contracts shall be executed by the contracting corporations under their seals, and, if it be a lease of any such road and for a longer period than one year, it shall not be binding unless approved by the votes of stockholders owning at least two-thirds of the stock of the corporation. Held, that where two street railroad corporations, though separate corporate entities, had the same office, officers and directors, and used and equipped cars interchangeably, paid operating expenses from the gross receipts of both, and were for all practical purposes one line, a passenger on one road could require a transfer to the other without extra charge, and could recover the statutory penalties for refusal to issue such transfer, notwithstanding there was no written contract between the corporations for the lease of one of the lines and though the arrangement between the companies was purely informal. (*Catalano v. International Ry. Co.*, 145 New York Sup., 1005.)

New York.—Temporary Injunction Restraining Construction of Elevated Railway.

The reconstruction of an elevated railway, so as to destroy to a greater extent than before an abutting owner's easements of light, air and access, would be enjoined on a preliminary motion, where there was no material disputed question of fact, instead of awaiting the trial of the action, pending which the structure would probably be completed. (*Rothschild v. Interborough Rapid Transit Co. et al*, 147 New York Sup., 1040.)

LIABILITY FOR NEGLIGENCE

Connecticut.—Injuries to Alighting Passenger from Car Overhang.

Plaintiff, having assumed a position, when she alighted from a car, which was apparently free from danger and without knowledge of the actual danger from the overhang of the car as it rounded the curve at such point, was not guilty of contributory negligence as a matter of law. (*White v. Connecticut Co.*, 92 Atlantic Rep., 411.)

Illinois.—Liability to Employee Riding on Pass.

A provision on the back of a free transportation ticket furnished to a street car employee releasing the company from all liability for personal injuries, was void, where the relation of carrier and passenger existed between the company and the employee. (*Klinck v. Chicago City Ry. Co.*, 104 Northeastern Rep., 669.)

Indiana.—Master and Servant; Injury to Motorman—Construction Work.

In an action by a servant for personal injuries caused by his having an unsafe place to work, the burden is on the servant to show that the master had knowledge, actual or constructive, of the dangerous condition long enough before the accident to have repaired it or to have given the servant timely warning of its condition.

A motorman operating a car drawing a plow on an uncompleted track on which no passenger or freight trains had been run was engaged in construction and assumed all risks incident to the service. (*Egan v. Louisville & S. I. Traction Co.*, 103 Northeastern Rep., 1100.)

Indiana.—Liability to Employee Riding on a Pass.

Where a street railway regularly furnished its servants with passes to and from their work, a stipulation in such passes exempting the company from liability for injuries caused by its negligence is unenforceable, being contrary to public policy, the issuance of the passes being one of the considerations for the employment. (*Indianapolis Traction & Terminal Co. v. Isgrig*, 104 Northeastern Rep., 60.)

Kentucky.—Degree of Care Required to Prevent Injury to Property.

A street railway is bound to use extraordinary care only for the protection of its passengers, and, where its car left the tracks and injured adjacent property, it was not negligent if it used ordinary care to discover obstructions which caused the accident. (*Kentucky Traction & Terminal Co. v. Bain* (two cases), 170 Southwestern Rep., 499.)

Massachusetts.—Negligence May Be Imputed to Child Nine Years Old.

Plaintiff, a boy of nine years, was injured while crossing behind a street car by being struck by another car on the opposite track. He was familiar with the locality, and although alone there was nothing to distract him from caring for himself. There was no evidence that he listened for an approaching car, and though he testified that he looked twice in the direction from which the car approached and did not see it, there was no evidence to show that he could not see the car which struck him from the place where he looked. Held, that plaintiff was guilty of contributory negligence as a matter of law. (*McManus v. Boston Elevated Ry.*, 103 Northeastern Rep., 284.)

Massachusetts.—Duty to Inspect Car Equipment.

The plaintiff was injured, while a passenger, by the breaking of a bolt in the back of a seat against which she was leaning. The bolt had a break which was invisible when it was in place, but it could have readily been removed for inspection. The cars had been in use for five years, and there was no evidence that the bolt had been inspected during that time, although it was an important bolt and in a position which subjected it to strains. Held, that the question of defendant's negligence was one for the jury, and that it was error to direct a verdict in its favor. (*Murphy v. Milford, A. & W. St. Ry. Co.*, (two cases), 210 Federal Rep., 138.)

Massachusetts.—Injury to Passenger from Person Not in Employ of Company.

Where a passenger, who entered a closed subway car through its front vestibule, put her hand back of her on the jamb of the door to save herself from being thrown forward when the car started and someone not in the service of the carrier shut the door on her thumb, the carrier was not liable, where it was not the custom or duty of its servants to close the door. (*Tracy v. Boston Elevated Ry. Co.*, 105 Northeastern Rep., 351.)

Massachusetts.—Car Passing Stationary Car.

The operation of a car on one track on approaching a stationary car on another, in violation of the rule requiring the slowing down of a car and the sounding of the gong when passing a stationary car, is negligence. (*Emery v. Boston Elevated Ry. Co.*, 105 Northeastern Rep., 889.)

Missouri.—Responsibility for Panic Following Controller Explosion.

The explosion of a car controller is prima facie evidence of negligence, and imposes on the company the burden of showing that the explosion was due to unavoidable accident. The death of a passenger pushed from the rear platform by other passengers in their haste to leave the car after such an explosion was the natural consequence of it, the test of liability being whether there was an appearance of imminent danger that reasonably should have been anticipated as too terrifying for passengers to face without alarm. (*Agnew v. Metropolitan St. Ry. Co.*, 165 Southwestern Rep., 1110.)

Missouri.—Boarding Moving Elevated Car.

One who attempted at an elevated station to board a moving car, the gates of which were being closed, is guilty of contributory negligence as a matter of law, where the step of the car was within a few feet of the end of the platform, at which point the company maintained a sign warning the public against boarding moving cars. (*Speaks v. Metropolitan St. Ry. Co.*, 166 Southwestern Rep., 864.)

Nebraska.—Injury to Passenger Riding on Steps.

A person standing on the steps of a moving street car, being unable to secure a seat or standing room within, is presumed to be there with the consent of the servants in charge of the train. (*Kadner v. Omaha & C. B. St. Ry. Co.*, 151 Northwestern Rep., 169.)

New Jersey.—Injury to Pedestrian at Corner from Car Overhang.

In view of the well-known fact that in rounding a curve the rear end of a street car will swing beyond the track and overlap the street to a greater extent than the front, the motorman is justified in presuming that an adult person standing in the street near the track, who is apparently able to see, hear and move, having notice of the approach of the car and of the existence of the curve in the track, will draw back far enough from it to avoid being struck by the rear of

the car as it swings around the curve in the usual and expected manner, and under such circumstances it is not negligent operation on the part of the motorman to continue the progress of the car without warning such person of the possible danger of collision with the rear of the car, because of the swing, if he remains in the same position. (*Miller et al. v. Public Service Corporation of New Jersey*, 92 Atlantic Rep., 343.)

New York.—Injury to Boy Who Climbed on Bumper.

Plaintiff, with five other boys, climbed on the rear bumper of defendant's trolley car and claimed that he intended to pay his fare. After the car had gone a few hundred feet the conductor came toward the boys, called to them to get off and made threatening gestures but was too far away to cause serious apprehension. Plaintiff and his companions sprang from the car, landing on their feet, when plaintiff ran onto the opposite track without looking for a car and was struck by a car going in the opposite direction. Held, that the facts were insufficient to raise an inference of actionable negligence on the part of the conductor in forcing plaintiff from the car by threats of personal violence. (*Luter v. Union Ry. Co. of New York*, 145 New York Sup., 893.)

New York.—Application of Sand and Brakes on Rainy Day.

An error of judgment by a motorman as to the time when he must apply sand and brakes on a rainy day, to avoid collision, is not negligence as a matter of law. (*Koster v. Conney Island & B. R. Co.*, 151 New York Sup., 56.)

New York.—Third-Rail a Nuisance on Highway.

Where an electric third-rail used by a railroad to furnish motive power projected into a highway crossing unnecessarily, it was a nuisance, and the railroad was liable for an injury occasioned thereby. (*Bloss v. Oneida Ry. Co.*, 147 New York Sup., 728.)

Ohio.—Traffic Agreements—Personal Injuries.

When one company makes an agreement with another company, under authority granted by Sec. 3443—17, Rev. Stat., for the joint use of its tracks, it is liable for injuries caused by the actionable negligence of its licensee thereon. The statute does not provide exemption from such liability, and as against the public it will not be implied. (*Quigley v. Toledo Rys. & Light Co.*, 105 Northeastern Rep., 185.)

Oregon.—Injuries to Persons on Track.

Where there is evidence that a railroad acquiesced in the use of a bridge as a footway by the public, an instruction requiring of the railroad only the lowest degree of care for the protection of a person on the bridge was error. (*Doyle v. Portland Ry., Lt. & Pr. Co.*, 143 Pacific Rep., 624.)

Oregon.—Measure of Damages for Death Under Employers' Liability Act.

The measure of recovery for death under Employers' Liability Act (Laws 1911, page 17) Sec. 4, giving a right of action for death caused by a violation of the act, is the pecuniary loss sustained, and the jury may not consider as element of damages deprivation of comfort, society, support and protection. (*Fisher v. Portland Ry., Light & Power Co. et al.*, 145 Pacific Rep., 277.)

Oregon.—Violation of Fender Ordinance Negligence Per Se.

The operation of street cars not equipped with a fender as required by a valid city ordinance, from which an injury to a child upon the track resulted, was negligence per se. (*Rudolph v. Portland Ry., Light & Power Co.*, 144 Pacific Rep., 93.)

Pennsylvania.—Master and Servant—Breakage of Coupling.

Where, in a street railway brakeman's action for injuries from falling between two freight cars being shifted by defendant's motor, it appeared that the cause of the accident was a jar due to the sudden application of power by the motorman causing the coupling to part, and there was no evidence that the coupling was out of repair or defective or different from those in ordinary use, a nonsuit was properly entered on the ground that the proximate cause of the accident was the act of plaintiff's fellow servant in the management of the motor. (*Cover v. Conestoga Traction Co.*, 92 Atlantic Rep., 495.)

Pennsylvania.—Injury to Passenger on Running Board.

Since, in an action for the death of a passenger from collision with the shafts of a passing vehicle while he was standing on the running board of a crowded summer trolley car,

the accident being due to the sudden and unexpected shying of the horse, there was no presumption of negligence on the part of the defendant railway company, the burden was on plaintiff to prove actual negligence. (*Kurts v. Philadelphia Rapid Transit Co.*, 90 Atlantic Rep., 525.)

South Carolina.—Power of Headlight Proper Question for Jury.

Evidence that a proper street car headlight would throw light on the track 200 yards ahead of the car, and that the headlight on the car by which decedent was killed only threw a light from 35 to 50 ft., made it a question for the jury whether the street car company was guilty of wanton negligence in not having a proper headlight. (*Kirkland v. Augusta-Aiken Ry. & El. Corp.*, 81 Southeastern Rep., 306.)

Texas.—Injuries to Persons on Tracks.

Where an intoxicated man negligently stepped in front of an approaching street car, his would-be rescuer stands in the same position as the intoxicated man, and the negligence of the latter is attributed to the rescuer, so that no recovery can be had against the street car company, though its servants were also guilty of negligence. (*Scates v. Rapid Transit Ry. Co.*, 171 Southwestern Rep., 503.)

Utah.—Conductor's Assent to Passenger Alighting from Moving car.

Where a passenger on a street car, which he thought would follow one route, upon discovering that it had turned off, requested a transfer from the conductor so that he could catch a car following, and the conductor said that he could get off as the car was moving slowly, the passenger's attempt to alight in accordance with the suggestion of the conductor is not contributory negligence as a matter of law (quoting *Paul v. Railroad*, 30 Utah, 30, 83 Pac. 564). (*Gaines v. Ogden Rapid Transit Co.*, 141 Pacific Rep., 110.)

Washington.—Company Not Liable for Injury to Employee Riding on Pass.

Even though an employee of a common carrier was promised free transportation as part of her compensation, yet where, on applying therefor, she was required to and did sign an application stating that the pass issued was a mere gratuity and based on no consideration, she thereby waived, as she had a right to do, the benefit of her prior contract for free carriage, and hence would be a mere gratuitous passenger for whose injuries caused by negligence the carrier was not liable. (*Hageman v. Puget Sound Electric Ry.*, 141 Pacific Rep., 1028.)

Washington.—Injury to Infirm Passenger from Sudden Start.

Where an infirm passenger walking on crutches entered a street car it was the duty of the conductor not to direct the starting of the car until the passenger had secured a seat. (*Rice v. Puget Sound Traction, Light & Power Co.*, 141 Pacific Rep., 191.)

Wisconsin.—Injuries to Passenger from Car Overhang.

Plaintiff having often boarded street cars before they rounded a corner where she desired to board a car, approached the usual stopping place without notice of an ordinance requiring the car not to stop until it had turned the corner. The motorman signaled her to go to the far corner, which she started to do. The car was then approaching a curve at about 3 m.p.h., and the speed was increased to 6 m.p.h. before the car got around the curve, which was on a grade, and, as it did so, plaintiff was struck by the outswing of the car. Held, that there was no evidence of actionable negligence on the part of the carrier. (*Kuhn v. Milwaukee Electric Ry. & Light Co.*, 149 Northwestern Rep., 220.)

Washington.—Duty of Pedestrian at Street Crossing.

While one about to cross a street railway track is not under an absolute duty to stop, look and listen, he cannot, with knowledge that a street car is approaching, step heedlessly in front of it, under the assumption that it will not overtake him.

Though a street car may have been operated at an excessive speed, the company is not liable for injuries to plaintiff from being struck by the car, unless the excessive speed was the proximate cause of the injury. (*Beeman v. Puget Sound Traction, Light & Power Co.*, 139 Pacific Rep., 1088.)

News of Electric Railways

BOARD APPROVES DETROIT CONTRACT

Terms of Contract Published by Board of Street Railway Commissioners—Procedure Outlined for Fixing Price and Transferring Railway to City

The board of street railway commissioners of Detroit on Wednesday made public the text of the contract which it has approved for the purchase of the lines of the Detroit United Railway within the one-fare zone. Publication was also made of the amendment to the city charter which must be passed by three-fifths of the voting electorate before the contract can be carried out by the city. The contract will be submitted to the stockholders of the railway on Aug. 2. If they accept the contract, as officials of the company will recommend to them, the street railway commissioners will take steps to have the Common Council name a date for the submission of the purchase question to the electors. It is understood that the election, if one is called, will be held about the middle of September.

The contract provides that the price of the lines within the one-fare zone shall be fixed by the Circuit Court of Wayne County, sitting as a Court of Chancery. The right of appeal to the State Supreme Court is reserved for both parties under an agreement that the decision of the latter tribunal shall be final and binding upon both.

It further provides that the property shall be delivered to the city on a specific date to be fixed by the circuit judges, which shall be decided within thirty days after suit has been started to fix the price. This provision allows the city to take possession of the lines within sixty days after the election, inasmuch as the suit must be started within thirty days after election.

The contract provides that the city shall accept the property subject to, and shall pay, the existing mortgages upon the property delivered to the extent of the price fixed by the court, and the balance of the mortgage debt, if any, shall be discharged on maturity by the railway. If the price exceeds the mortgage debts, the excess shall constitute a lien on the property. The city shall be obligated for the existing mortgages only to the amount of 2 per cent of the assessed valuation of the city (about \$11,000,000). The amount, not to exceed the prescribed 2 per cent, shall be fixed in the decree and shall consist of at least \$1,000,000, falling due on June 1, 1916, and of a portion of the first consolidated mortgage falling due on Jan. 1, 1932. All of the purchase price in excess of the amount assumed as a personal obligation by the city shall be secured by a lien due on or before Jan. 1, 1932. Payment of this sum shall be provided for from a sinking fund to be set aside from the earnings of the lines. Interest on the mortgage indebtedness which the city assumes is also to be paid from earnings.

Provision is made that in order to bind all the mortgage bondholders to the terms of the contract, the trustees of the mortgages shall be made party to the suit. The railway agrees that they shall all enter their appearances in the suit "in order that all persons interested may be before the court, all interests protected and a perfect title passed."

Accompanying the contract and charter amendment, the commissioners issued a statement explaining from their point of view what the contract really contained. They urge that the people trust the Circuit Court judges to give justice to both parties, and indicate their idea of what the city can accomplish through municipal ownership in the following language:

"The whole plan of the commission is to pay for the entire property and its extensions out of earnings, but this involves a longer time than sixteen years. If no extensions were necessary, the profits would pay the purchase price and operating charges at the present rates of fare by 1932, but as extensions and improvements are necessary to a large extent, a longer term will probably be necessary, and in the meantime two methods of procuring the necessary additional capital have been provided by the charter amendment. (Pledge credit of city up to \$11,000,000, and pledge earnings of lines.)

"It is the confident belief of the members of the commis-

sion that outside of a part of the \$1,000,000 due on June 1, 1916, it will never be necessary to call on the city to issue any of its own bonds to meet payments, but the earnings of the railway, plus the borrowing power based upon the pledge of future earnings, will take care of all future payments."

COMPLAINT FILED AGAINST CITY

Puget Sound Traction, Light & Power Company Alleges Policy of Harassments Is Being Pursued by the Municipality of Seattle

The Puget Sound Traction, Light & Power Company, Seattle, Wash., on July 23 filed a complaint against the city of Seattle with the State Public Service Commission, alleging that the municipality has entered into a campaign of harassments against the company. In filing the complaint the company asks that a date for a hearing be fixed, and that an order be entered declaring the provisions in its franchises requiring payment for bridges, paving, filling and maintenance of streets, and the payment of a percentage of the gross receipts of its railway system, discriminatory and void.

The company sets forth that in accepting its franchises it was with the understanding that the corporation should not be harassed by the city of Seattle. Instead of following that policy, the city has entered into competition in the light and power field and in the operation of street railway lines, and has adopted a program of harassments, causing the company to lose large sums of money in defending itself against demands made in conflict with the terms of its franchises. One specific instance cited is the fact that the City Council passed an ordinance requiring the sale of twenty-five tickets for \$1, or six for 25 cents, in conflict with the franchises, and that before the court nullified the ordinance the requirement cost the company approximately \$60,000 in loss of revenues.

The complaint also cites the fact that paving improvements planned by the city will cost the traction company \$223,000 in paving that portion occupied by tracks, and that the 2 per cent of the gross earnings paid into the city yearly amounts to about \$70,000. The petition prays that the company be relieved of these burdens. The complaint further refers to the passage of a bill requiring the company to build a line on East Union Street, where it had no franchise, and the effort made to convict officials of the company in criminal proceedings for failure to build such a line.

The entry of the jitney bus as a common carrier competitor is further cause for complaint. It is stated that the city, in the autumn of 1914, without lawful authority, issued licenses to more than 500 jitney buses to operate as common carriers along lines of the street railway. The company asserts that its loss of revenues from Nov. 1 to April 1 has amounted to from \$45,000 to \$60,000.

Reference is also made to the practice of the city lighting department in making excessive charges for street lighting, paid by the general public, in order that rates may be reduced to private and small consumers. This excess charge, it is said, amounts to \$80,000 per year. In other words, the city charges itself for street lighting \$80,000 a year more than what the same service could be obtained for from the complainant.

P. R. T. OUTLINES OBJECTIONS

Philadelphia's application for a certificate of public convenience, the next step toward building the Broad Street subway and the Frankford elevated, was argued on July 26 in Harrisburg before the Pennsylvania Public Service Commission. Appearing in opposition to granting the certificate were E. A. Ballard, chief counsel Philadelphia Rapid Transit Company; Ruby R. Vale, counsel for D. E. Dallam, whose suit for an injunction was described in the *ELECTRIC RAILWAY JOURNAL* of July 24; and Charles L. Fluck, of the Northwest Business Men's Association. City Solicitor Ryan was present on behalf of the municipality, and A. Merritt Taylor, Director of City Transit, was the sole witness heard.

All parties will submit briefs, which must be on file within ten days from July 30.

After Director Taylor had offered testimony that the city was legally qualified and financially capable of building the lines in question, Mr. Ballard announced the arguments that the company will submit in an effort to hold up construction of those lines. The company's brief will cover these points:

1. That by the act of March 23, 1866, the city of Philadelphia is prohibited from constructing a railroad on or along Broad Street.

2. That by the act of March 26, 1873, which virtually formed a contract between the State of Pennsylvania and the Thirteenth and Fifteenth Streets line, it was set forth that no other line should be built along Broad Street. According to Mr. Ballard, the Supreme Court has decided that this contract cannot be abrogated except by condemnation proceedings, and such proceedings have not been instituted.

3. That the contract of 1907, section 3, provides that Councils shall determine the routes and other conditions under which railway lines shall be built, and that the Philadelphia Rapid Transit Company shall have ninety days' option on the right of building necessary lines.

MERALCO INCOME FOUND ADEQUATE

Commission Reports on Financial Ability and Service of Manila Electric Railroad & Light Corporation— Fenders, Brakes and Training Suitable

The Board of Public Utility Commissioners at Manila, P. I., recently handed down a full decision covering various points raised in the investigation of the Manila Electric Railroad & Light Corporation. The company's contention that under existing rates its revenues from transportation are not sufficient to provide for the adequate maintenance and depreciation of the property used in the service, the safeguarding of the investment therein and a reasonable return thereon, is not sustained. The commission expresses its belief that the city of Manila is paying such a return on the investment as would entitle it to a thoroughly adequate and up-to-date service.

In rendering its final decision, the board took into consideration the full financial statement of the cost of the property operated as of Dec. 31, 1913. This was obtained from the holding company incorporated in New Jersey. The total investment shown by it on that date was 10,630,283 pesos, as compared to 11,107,300 pesos, the valuation set by Manager Duffy a year ago for the local holdings. Several items on this statement were not allowed, however, and the final estimate of the capital investment made by the board was between 7,500,000 and 8,000,000 pesos.

In its decision the board took up numerous points in connection with the street car service in Manila, complained of by the Philippine Chamber of Commerce. In conclusion it required the company to use vacuum cleaners on its cars during the dry season, to prohibit expectorating in the cars and the placing of the feet on seats by passengers, to brace all its open cars both longitudinally and transversely, to treat the roofs of all cars with waterproof preparation before the setting in of the rainy season, to provide all car windows with clutches, to prohibit passengers from riding on the sideboards or side steps of the open or closed cars, and to prohibit all overcrowding of passengers either on the front or rear platforms of open or closed cars.

The attention of the board had been called to street railway accidents which had occurred in Manila, with the charge that these were caused by defective brakes, improper training of motormen and inadequate inspection of rolling equipment. In answer to these complaints the company had asserted that the street railway accidents in Manila were comparatively infrequent; that the motormen were subject to physical examination and were duly instructed before being allowed to take charge of cars; that all cars and equipment were inspected once in every forty-eight hours; that owing to the fact that there were no rains and the rails were always dry and clean and the cars not heavy, the brake equipment was adequate, and that each

car having its own motors was equipped with fenders which were approved by the municipal board in accordance with the company's franchise.

In connection with these points the commission decided mostly in favor of the company. It stated that it was not satisfied that the fenders at present in use were unsafe or inadequate. Until some type was offered which could be employed in the narrow streets of Manila with more decided advantage, the defendant company would not be obliged to make any change. Moreover, in the light of local conditions, the commission was unable to find that the present brake equipment was inadequate and unsafe. In view of the results of the investigation of the company's personnel, the commission found that the employees were adequately trained for the operation of the cars.

ULTIMATUM IN DES MOINES

The Harris Trust Company, Chicago, which controls the Des Moines (Iowa) City Railway, has delivered an ultimatum to the Des Moines Council, through the Des Moines Chamber of Commerce, in regard to the local franchise situation, which has been hanging fire for several months. The amount of capitalization has been the question which all former attempts at a franchise agreement have failed to solve. The company, reducing its capitalization from \$5,400,000 to \$5,000,000 in an effort to meet the issue, has been unable to appease Mayor Hanna, who demands a figure of less than \$5,000,000. A committee of the Chamber of Commerce, trying to mediate the differences between the City Council and the company, recently went to Chicago and sought to have the capitalization figure reduced from \$5,000,000. The substance of a letter in reply to this effort follows:

1. The Des Moines City Railway will not consider or discuss any further reduction of capitalization, which means that it will not continue the negotiations unless a capitalization of \$5,000,000 is recognized.

2. Unless a settlement of the franchise is secured, the company will fight its receivership through with the purpose of attempting to override the decision of the State Supreme Court and secure a decision in the Federal Court that the franchise voided by the State Court is perpetual.

3. The owners of the system are tired of being pushed by the city hall officials and now regret the \$1,000,000 spent in improvements since the dispute started. If the company had obeyed the order of the Supreme Court and torn up its tracks, the City Council thus would have been forced by public sentiment to a settlement as the result of public inconvenience.

The company is still willing to try for a franchise if a basis of agreement can be reached, but at present negotiations are at a standstill while members of the Council and the Chamber of Commerce committee are on vacations.

RHODE ISLAND ARBITRATION BEGUN

Arbitration proceedings were begun on July 26 at Providence, R. I., between the Rhode Island Company and its employees to fix wages and hours of labor. James H. Vahey, Boston, Mass., represented the employees' union, and James M. Swift, Fall River, Mass., appeared as counsel for the company. President A. E. Potter was the principal witness.

Mr. Potter stated, in answer to inquiries, that his salary is \$12,000 per year. Upon consultation, it was agreed that a list of the salaries of various other officials should be filed confidentially with the arbitration board, in order to avoid the effects of publicity. Mr. Potter said that the company in conference proposed an increase to the employees, the offer being a guarantee of six hours per day at 25 cents per hour minimum, with 0.5 cent increase if the revenue increased, and a further increase of 1 cent if the revenue increased further. This was in place of arbitration, and was made particularly for the benefit of the spare men, as far as hours of labor were concerned. The regular men outnumber the spare men by about two to one. The present wage scale is from 23 cents to 28.5 cents per hour. Mr. Potter said that the 0.5 cent increase offered was contingent upon an increase of 2 per cent in the gross earnings of the coming year, the adjustment being made quarterly. He

said that it was impossible to eliminate finances from consideration in discussing wages.

Mr. Potter felt that the men are getting a living wage, and that an increase is not necessary as the men are living reasonably well. He could not see how the men deserve an increase when those on other roads are getting less and could be employed for less. During the strike the company did not try to get these men. None were advertised for, and the company took only those that came along and applied for work. Mr. Potter said that if fares could be increased he would like to see the employees get higher wages. The company has 1000 cars representing an investment of \$5,000,000; 400 miles of track representing \$15,000,000; a \$5,000,000 power plant and a tunnel worth \$1,000,000. The physical characteristics of the system were briefly reviewed, and Mr. Potter said that more than half of the men have worked over four years for the company. He considered platform work unskilled labor, comparing the motorman to a truck driver and the conductor to a clerk.

Recalled to the stand on the second day, Mr. Potter said that in his opinion the fact that the men receive free transportation and overtime compensation offsets the time required to work up conductor's day cards. On the entire system from thirty to forty accident reports are usually made out, covering minor troubles as well as serious difficulties. Some of the men find suburban runs more difficult than those in Providence. The witness did not feel that the work in Providence is more difficult than that in other places. He thought that in Springfield, Mass., and Pawtucket, R. I., the work was more difficult. Counsel for the union initiated a line of questions relative to the comparative cost of living in Providence and elsewhere, but on objection of counsel for the company this topic was withdrawn before the board ruled, on the ground that it would unduly lengthen the proceedings. Relative to the quality of work done in the shops, Mr. Potter said that in the opinion of some of the foremen the work has been done less well since the organization of the union.

HASTY BUT LEGAL ACTION IN TORONTO

Chairman D. M. McIntyre of the Ontario Railway & Municipal Board has issued his judgment upon the Toronto Railway's application for an order compelling the city to relay the tracks on Yonge Street. The judgment, which is in favor of the city, is, in effect, that the purchase of the Toronto & York Radial Railway's tracks and equipment by the Toronto Railway did not give the company the legal right to operate the section of line referred to, and that while the company has franchise rights on the street it can exercise them only by complying with the terms of the general agreement—by submitting plans to the city engineer, etc., for a new line or extension.

The appeal to the board arose out of the action of the city on June 26 in tearing up 1320 ft. of track south of Farnham Avenue, immediately after the Toronto & York Radial Railway franchise for that part of Yonge Street expired. The Toronto Railway, which had a few hours before purchased the track and overhead equipment, intending to give a service on that section, appealed at once to the board for an order restraining the city from proceeding further and for an order compelling the city to relay the tracks, claiming that since the Toronto & York Radial Railway franchise had expired the Toronto Railway automatically came into possession of rights on the stretch.

Counsel for the city denied the jurisdiction of the Ontario Railway & Municipal Board to deal with the matter, and held that in any case the city was within its rights in removing the tracks. The only way the company could operate there was by submitting plans for tracks, etc., to the city engineer in the regular way. The board, after asserting its jurisdiction, proceeded in the judgment to deal with the claim of the company that it acquired a franchise right on the section of Yonge Street referred to when the Toronto & York Radial Railway franchise expired. This claim, which was not argued by the city, the board finds to be a just one, but by referring to the terms of the agreement between the company and the city the board takes the position that while the franchise right exists and the company owns the tracks and overhead equipment, it

cannot make the track a part of its system. The portion of Yonge Street dealt with must be regarded as the proposed site for an extension of the company's railway, which brings it under the conditions respecting such extensions. In the judgment Chairman McIntyre took a thrust at the city for causing inconvenience to the public by tearing up the tracks. Referring to the number of complaints received from residents and ratepayers of the district, Mr. McIntyre pointed out that the city acted within its strict legal rights and that the board was obliged to determine the issue solely upon that basis. He added: "If the city authorities have caused discomfort and loss to citizens by destroying, needlessly and in haste, property which might under some interim arrangement have continued to serve the transportation requirements of a portion of the community, the citizens must carry their complaint to the city authorities."

DEADLOCK ON TOLEDO DRAFT APPROVAL

Until late in the afternoon of July 29 the franchise committee and representatives of the Toledo Railways & Light Company, Toledo, Ohio, discussed the question of whether the committee should recommend the tentative draft of the franchise to Council and whether that body will take action on it or simply file it for reference to the voters at a referendum election. It was not possible, however, to reach any agreement, and the meeting was finally adjourned until the afternoon of Aug. 3.

At the conference on July 28 a deadlock between the committee and Henry L. Doherty developed on this point. Mr. Doherty said the negotiations would be of no avail if Council did not take some action on the tentative draft before it is sent to the people. He continued:

"I would rather go to the people with Council's rejection and say this administration has failed to do its plain duty than have Council sit back and take no action whatever. This draft is according to your views and you frankly state that it protects the people. They are entitled to know the result of your work and to ask you whether the draft is a good one or not."

Member F. M. Dotson said that he believed the report to be made to Council would accomplish the purpose of a recommendation, and that the Council members believed the proposed franchise would provide for "a well-operated system, good service, minimum rates and a workable plan for obtaining municipal ownership." Mr. Doherty replied that if the committee would say that in so many words to Council, it would be all he would ask. Mr. Dotson, however, would not agree to that, and insisted that Council could only receive and file the report. He argued that if Council accepts and files the draft, the act would show that it is satisfied. Mr. Doherty asserted, however, that such a course would mean dodging the issue and that all he wanted was for Council to declare itself one way or the other. If the draft is not recommended, then some other course can be taken to get it to the voters. "We do not want to be placed in a position where Council, after accepting the report, can go out and fight the franchise," said Mr. Doherty.

N. Y. CONTRACTS LET AND APPROVED

A contract for the installation of tracks on the New Utrecht Avenue elevated railroad in Brooklyn has been awarded by the commission to Ward & Tully, Inc., the lowest bidders, for \$71,355. The work must be completed within five months after the delivery of the contract. The New Utrecht Avenue line is a three-track elevated railroad, extending from Thirty-eighth Street, Brooklyn, over the route of the so-called West End line of the Brooklyn Rapid Transit Company to Coney Island. It will be operated by the New York Consolidated Railroad Company as a branch of the Fourth Avenue subway.

The commission has approved the plans and form of contract for the supply of special work for the new rapid transit system in Queens and will open bids on Aug. 18. The special work consists largely of frogs and switches and will be used upon the new elevated railroad from the Queensboro Bridge to Corona, on the junction section on the Queensboro Bridge Plaza, for the new elevated railroad from the Queensboro Bridge to Astoria, and for the extension of the Queensboro subway from its present terminus

at Jackson and Van Alst Avenues, Long Island City, through Davis Street and Ely Avenue to the Queensboro Bridge Plaza.

The commission has approved plans and form of contract, submitted by the New York Municipal Railway Corporation, for the erection of steel, construction of tracks, etc., on the Broadway elevated railroad in Brooklyn between Myrtle Avenue and Aberdeen Street, in connection with the third-tracking of that line. The commission also approved the company's plans and form of contract for the supply of structural steel for widening and strengthening the Myrtle Avenue elevated railroad from Willoughby Avenue to Wyckoff Avenue for the third-tracking of that line. The company must submit both contracts to public bidding.

Agreement with Employees Extended in Toronto.—The agreement that existed between the Toronto (Ont.) Railway and the 2100 members of the company's employees' union for the last three years has been extended for another two years.

Electrical Prosperity Week Indorsed.—The Electrical Supply Jobbers' Association has passed a series of resolutions indorsing "Electrical Prosperity Week" and giving its whole-hearted support and co-operation to the movement. This week occurs Nov. 29-Dec. 4, 1915.

New Line Opened in Washington.—On July 28 the Washington Railway & Electric Company, Washington, D. C., put into operation a direct line between the northwest suburbs of the city and the government buildings on Fourteenth Street, south of the Mall. The line was established as a connecting link on the Fourteenth Street line between G Street and E Street, thus making the third north and south line to intersect Pennsylvania Avenue between the Peace Monument and the Treasury Building. On account of the cut off, several changes were made in the route of other lines.

Market Street Injunction Stayed in San Francisco.—The injunction issued to prevent the operation of San Francisco (Cal.) Municipal Railway cars over the outer tracks on lower Market Street, noted in the *ELECTRIC RAILWAY JOURNAL* of July 10, was stayed indefinitely on July 20 by a decision handed down by Judge Troutt of the Superior Court. In granting the city's petition Judge Troutt supplemented his written opinion with the statement that he intended the stay to be effective until the United Railroads of San Francisco could get a ruling from the Supreme Court as to his right to intervene in the injunction proceedings.

Injunction Issued in Montreal Franchise Case.—Justice Lafontaine in Practice Court on July 20 ruled that an interlocutory injunction should be issued to restrain the Board of Control and the City Council from further dealing with the Montreal (Que.) Tramways franchise renewal question, until such time as the Court shall have been afforded an opportunity to enter upon deliberations as to the merits of the allegations and counter-allegations arising from the board adopting, on the vote of Mayor Martin and Controllers E. N. Herbert and Thomas Cote, Controller Herbert's proposal of a thirty-year franchise agreement with the company.

New Pavement the Issue in East Cleveland.—The Cleveland (Ohio) Railway has notified the village of East Cleveland that it will not lay the new pavement between its tracks on Euclid Avenue through the town unless it is assured of a renewal of its franchise in 1921. The company, however, wants to make the fare 5 cents and the village has demurred. It has notified the company that the pavement will be laid, and the company held for the expense. The village asserts that the company has no franchise for a short stretch of its St. Clair Avenue line, and, if it does not do the paving on Euclid Avenue, the St. Clair Avenue cars will be stopped until the bill is paid. This would necessitate some arrangement to take care of the passengers on that line, which is the only one reaching Euclid Beach at the present time.

Trolley Pole Agreement Reached in Springfield.—An agreement has been reached between the city planning commission of Springfield, Mass., and the Springfield Street

Railway relative to arrangements for the removal of trolley poles in the heart of the business district between State Street and the Union Station. The company has consented to meet the cost of substituting span suspensions with attachments to abutting buildings for the existing poles, the estimated outlay being about \$5,000. About forty property owners are to be visited by the commission, and to each will be submitted a form of agreement which gives the company virtually a license to attach span wires but nothing in the way of an easement. If the owners consent, the City Council will be asked to grant the company the right to string span wires over the sidewalks, and the Massachusetts Public Service Commission will pass upon the plan.

Public Utility Committee Drafts Report.—The completed draft of the amendment proposed by the committee on public utilities of the Constitutional Convention was made public on July 24. The proposed article will permit the Legislature to limit the courts' powers of review, a prerogative the Legislature already possesses under the present constitution. The other principal provisions are as follows: (1) The public service commissioners shall be constitutional officers. (2) The terms are fixed constitutionally at five years. (3) The commissioners may be removed only by majority vote of the Senate upon "recommendation of the Governor stating grounds upon which such removal is recommended." (4) Each commission shall have the jurisdiction, powers and duties it now has, but nothing shall prevent the Legislature from enacting laws changing such jurisdiction, powers and duties; except that the Legislature shall not enact any law prescribing rates or standards of service until after it has received from one of the commissions a report thereon or until after the expiration of a prescribed period.

Board of Estimate Favors Tube Plan.—The Board of Estimate and Apportionment of New York City on July 21 unanimously adopted a resolution, introduced by President McAneny of the Borough of Manhattan, to notify the Public Service Commission for the First District of New York that in its opinion a tunnel should be substituted for the bridge plan for the connection of the new subway system with the Borough of Queens under the East River at Fifty-ninth Street. It was also stated that the board was prepared to supply the necessary funds for the tunnel work. The total estimated cost for the tunnel plan would be \$4,740,000 as compared to \$2,340,000 for the bridge connection. The board was assured by contractors that the tunnel could be completed within thirty months after the delivery of the contract, which would be about the time it would take to complete the unfinished sections of the new system. The Public Service Commission has withdrawn its objections to the tunnel plan and adopted a new route, No. 61, which will be a two-tracked subway under the East River from Fifth Avenue to the Queensboro Bridge Plaza.

PROGRAM OF ASSOCIATION MEETING

Railway Signal Association

The Signal Appliance Association has issued Bulletin No. 10. This submits information regarding the arrangements for the forthcoming convention of the Railway Signal Association, which will be held in Salt Lake City, Utah, on Sept. 14-16. The bulletin states that there will be no official exhibits at the convention, although informal exhibitions of devices at the meeting place will be encouraged. Arrangements have been concluded for a special train from Chicago, leaving at 11.55 p. m. Saturday, Sept. 11, over the Chicago & Northwestern Railway. The train will stop at Omaha, Ogden and Cheyenne to pick up passengers from connecting lines. It will arrive at Salt Lake City on Monday, Sept. 13, at 6.10 p. m. No special trains have been provided for the return trip.

The headquarters of the convention will be at the Hotel Utah in Salt Lake City, and reservations for rooms are to be made by members and guests direct with the management of the hotel. No formal program for the committee reports has been arranged at the present time, but Secretary Rosenberg of the Railway Signal Association will issue a complete statement on the first day of the convention. The annual banquet of the association will be held on the evening of Wednesday, Sept. 15.

Financial and Corporate

ANNUAL REPORTS

Brooklyn Rapid Transit Company

The comparative statement of income, profit and loss of the Brooklyn (N. Y.) Rapid Transit Company for the years ended June 30, 1914 and 1915, follows:

	1915	1914	Per Cent
Revenue from operation:			
Transportation	\$26,096,265	\$25,246,452	+ 3.37
Miscellaneous	331,421	311,797	+ 6.29
Total	\$26,427,686	\$25,558,249	+ 3.40
Operating expenses:			
Maintenance of way and structures	\$2,391,814	\$2,021,647	+18.31
Maintenance of equipment	2,401,841	2,315,990	+ 3.71
Operation of power plant	1,553,177	1,463,283	+ 6.14
Operation of cars—trainmen's wages	4,787,574	4,520,022	+ 5.92
Operation of cars—other expenses	1,744,690	1,696,132	+ 2.86
Damages	607,700	543,885	+11.73
Legal expense in connection with damages	261,153	219,758	+18.84
General law expenses	53,406	65,097	-17.96
Other general expenses	819,754	822,856	- 0.38
Freight and mail expenses	338,414	325,054	+ 4.11
American Railway Traffic Company—expenses	854	823	+ 3.76
Total	\$14,960,381	\$13,994,552	+ 6.90
Net revenue from operation	\$11,467,305	\$11,563,697	- 0.83
Income from other sources	438,715	451,771	- 2.89
Total	\$11,906,020	\$12,015,468	- 0.91
Deductions:			
Taxes	\$1,700,035	\$1,752,879	- 3.01
Interest and rentals (net)	4,693,424	4,946,884	- 5.12
Total	\$6,393,459	\$6,699,763	- 4.57
Net income	\$5,512,561	\$5,315,705	+ 3.70

The net income shows an increase of \$196,856 or 3.7 per cent over the preceding year, and in addition the system's reserves for depreciation were credited with \$256,384 as compared to a debit in the preceding year of \$53,191. The figures for the current fiscal year include the operations of the Coney Island & Brooklyn Railroad for the entire year, whereas for the preceding year those operations were included for only six months. The accumulated surplus on June 30, 1915, after making sundry adjustments to the profit and loss account, and after the payment of dividends at the rate of 6 per cent per annum on the entire amount of capital stock outstanding during the year, namely, \$74,520,000, was \$10,621,966, an increase of \$889,377 over the surplus on June 30, 1914.

The report calls attention to the fact that, excluding for comparison the newly acquired Coney Island & Brooklyn Railroad lines, the passenger earnings of the system failed for the first time in the history of the company to show a substantial increase over the passenger earnings of the preceding year. Instead there was a decrease, which is attributed to two main causes: (1) The general depression in business and industry affecting Brooklyn as well as other portions of the country, reflected in a large number of men and women out of work and a tendency toward economy in expenditures. (2) The very liberal increase in transfer facilities which went into effect on June 1, 1914, under order of the Public Service Commission, whereby the total number of transfer points on surface railroads in the system was increased from 721 to 1008. The first year of operation under this order shows an increase of 10,552,274 transfer passengers carried, and a decrease of 2,141,700 cash passengers. This situation presented not merely a loss in revenue but occasioned an increase in expense by reason of the increased service required for the transportation of the large number of additional transfer passengers. Of the total increase of 6.9 per cent in operating expenses, nearly half, or \$456,018.38, was due to charges to maintenance of way and structures and equipment, and \$267,551.52 to trainmen's wages.

The report reviews the progress of work on rapid transit lines under contracts with the city, and expresses the opinion that owing to delays in letting contracts for construc-

tion the enlarged system will not be completed and ready for operation on Jan. 1, 1917, as expected. A synopsis of the company's rapid transit work shows that four tracks in the Centre Street loop have been completed; the Thirty-eighth Street construction substantially progressed; the four-track Sea Beach line completed and placed in operation; two tracks of the Fourth Avenue subway between Chambers Street and Sixty-fifth Street equipped and operation thereover begun; Broadway and Myrtle Avenue connection and the Lutheran Cemetery line completed; all of the Liberty Avenue elevated extension completed except the stations; first section of the Jamaica Avenue elevated extension begun; third-tracking of the elevated lines progressed; 300 new subway cars ordered, 160 of which have been delivered; comprehensive contract for signal equipment for rapid transit lines entered into and numerous additions to power plant supplied. The total expenditures for rapid transit work by the New York Municipal Railway Corporation to June 30, 1915, were \$30,010,860. The pooling of earnings with the city, which began on Aug. 4, 1913, shows a deficit to June 30, 1915, in meeting the company's preferentials of \$545,413, and a deficit in meeting the city's interest and sinking fund of \$714,722.

Among the items of maintenance, additions and improvements on other than rapid transit lines, were the relaying of 83,930 ft. of surface track; overhauling and repairing of an additional 96,072 ft. of surface track; the installation of 154 pieces of special work; the laying of 146,578 sq. yd. of improved pavement; the renewal of 51,658 lin. ft. of track on elevated lines; the painting of 22,593 lin. ft. of elevated structure; the building of 140,508 lin. ft. of footwalk on elevated structure, and the installation of 16,789 ties on elevated track and 39,630 lin. ft. of timber guard rail.

During the year the company expended in the maintenance and improvement of the club rooms for employees, in support of the pension system, in medical inspection service and in sickness and death gratuities in cases not reached by the employee's benefit association, the sum of \$78,742. The system of compulsory medical inspection accomplished during the past year a reduction in the amount of time lost by the operating employees on account of sickness of 13,485 days (or nearly 18 per cent) over the time lost in the year ended June 30, 1914. The milder winter of 1915 accounted for about 7000 days of the total reduction. Making due allowance for this, however, there still remains a saving of upwards of 6000 days' work for the year, or a reduction of 8.6 per cent over the sickness record of the year ended June 30, 1914. The system was also accompanied by a reduction of 24 per cent in the number of days' work lost by operating employees on account of illness.

On account of the high rate of insurance fixed by the New York Fire Insurance Exchange two years ago the company was obliged to insure its risks with London Lloyds, where a much lower rate was obtainable. Last year the local exchange offered a rate lower than Lloyds, and about 20 points lower than the rates fixed in the preceding year, so that the insurance was placed for three years with domestic companies at an average rate of 0.25387, which has since been reduced to 0.23358. The company's insurance reserve fund has reached \$787,439, an increase of \$188,242 during the year.

Liverpool Corporation Tramways

The report of the Liverpool (England) Corporation Tramways for the year ended Dec. 31, 1914, shows that the total revenue for the year amounted to £722,307, operating costs (including rental of leased lines) £473,678, and gross profit £248,629. The gross profit was apportioned as follows: Interest, £50,082; sinking fund and repayment of loans, £63,726; reserve, renewal and depreciation account, £34,821, and contribution in aid of the general rate, £100,000. The net profit for the year amounted to £134,821, a decrease of £19,341 as compared with 1913.

The following figures may prove interesting in connection with the financial position of the tramway since it came into the hands of the city: The total sum set apart for sinking fund and redemption of debt up to Dec. 31, 1914, amounted to £1,177,949; reserve, renewal and depreciation,

£800,623; contribution in relief of rates, £572,898. In addition, the sum paid by the tramways since 1897 in rates and taxes amounts to £401,383.

The number of passengers carried, miles run and traffic receipts for 1914, compared with 1913, are as follows:

	1914.	1913.	Increase.
Passengers.....	145,656,374	144,085,927	1.1%
Receipts.....	£684,626	£677,881	0.9%
Mileage.....	13,657,888	13,442,605	1.6%

From the above figures it will be seen that there was an increase in the traffic receipts of £6,145, notwithstanding the fact that the country was under war conditions for nearly five months. The receipts from Jan. 1 to Aug. 1 showed a progressive increase equivalent to 4 per cent. The average earnings per car mile for the year 1914 amounted to 12.02d, as against 12.10d for 1913, a decrease of 0.08d. This decrease was due to the issuing of one and three-quarter millions of free passes to members of His Majesty's forces.

APPEAL TAKEN FOR BOND ISSUE

Washington Railway & Electric Company Wants Court to Remove Valuation Restriction Imposed by Commission

The Washington Railway & Electric Company, Washington, D. C., on July 20 appealed to the Supreme Court of the District of Columbia to set aside a ruling by the Public Utilities Commission which declined to approve a bond issue of \$341,000 requested by the railway. The company a few months ago asked for a total issue of \$694,000 in bonds, but the commission would allow only \$353,000 to be issued at that time or until the commission had completed its valuation of the company's property. Previous references to this case were made in the *ELECTRIC RAILWAY JOURNAL* of Jan. 23 and April 3.

Eight different reasons are set forth in the company's petition to substantiate its claim that the failure or refusal of the commission to approve the bonds is illegal. It has no assurances when, if ever, the valuation will be completed by the commission. The commission makes a distinction between issues of bonds for capital charges sought voluntarily by the company and those made under express direction of Congress, issues of the latter class always having been approved.

There is no question, says the company, as to the legitimacy of the charges or of the fact of actual expenditure. It is asserted that the law does not contemplate the completion of valuation before action by the commission on its application. The commission is not required to have before it the relation which the value of the property bears to outstanding stocks and bonds before approving the issue. Ascertainment of valuations cannot lawfully enter into or affect the question of the legitimacy of the capital expenditures for which issuance of bonds is desired.

The question of present capitalization is not drawn into controversy, the company contends, by the application for approval of bonds. Even if it were, the company shows that all of its outstanding stocks and bonds were issued and applied under the act of June 5, 1900, and before the creation of the Public Utilities Commission, and that the commission cannot lawfully affect or disturb the existing capitalization fixed with the express sanction of Congress.

The company explains that between Jan. 1, 1909, and Nov. 30, 1914, it expended for additional equipment and extensions the sum of \$457,849. It asserts that it is entitled to have its requested issue of \$694,000 of bonds approved and asks the court to set aside so much of the order of the commission as denied the right of the full issue.

BRISTOL TRAMWAY SALE NEGOTIATIONS

Some time ago the option committee of the Bristol Corporation and the representatives of the Bristol (England) Tramways met to see if any arrangement could be arrived at between the two sides with regard to the future of the tramway undertaking. The company broke off negotiations and the corporation has now reopened the matter endeavoring to find out from the tramways company whether some arrangement cannot be arrived at so as to secure the full development of the transit facilities in order

to meet not only the present but the future requirements of the city and surrounding districts. The corporation lays down various conditions which it would like to see fulfilled, and asks if, in the event of the corporation undertaking not to exercise its option of purchasing the tramways, the company will make an offer to enter into an agreement based on these conditions. In the meantime, however, the Bristol Tramways Company is applying for powers to extend its business. It desires not only to continue in the tramway business but to carry on the business of motor-car manufacturers, motor-car engine manufacturers, and repairers and dealers in motor-cars and their parts. It also desires power to include the manufacture of airships and aeroplanes, and, quite naturally at present, power to manufacture ammunition, arms and the like. The company has orders for armed motor-cars, and it desires to do everything necessary to complete them, putting in the guns, etc. Being a large generator of electricity, the company also desires power to supply electricity to other firms, and in other smaller ways to extend its business.

Boston (Mass.) Elevated Railway.—The directors of the Boston Elevated Railway have declared a dividend of 1½ per cent, payable on Aug. 16 to stockholders of record on Aug. 5. During the year ended June 30 the company paid 5½ per cent in dividends, the dividend for the last quarter being 1 per cent. Through Boston bankers the company has sold an additional \$1,000,000 of 5 per cent gold debenture bonds dated 1912 and due on Dec. 1, 1942, for 95.68 and interest, to yield 5.3 per cent. As mentioned in the *ELECTRIC RAILWAY JOURNAL* of June 19 in connection with the award of the bonds to the syndicate, this sale makes \$5,000,000 of the issue outstanding.

Federal Light & Traction Company, New York, N. Y.—The voting trustees for the capital stock of the Federal Light & Traction Company gave notice this week that the voting trust agreement would expire by limitation on July 29 and that on and after that date the voting trust certificates might be surrendered and exchanged for proper certificates for the common stock of the company. All holders were required to surrender their certificates on and after the date mentioned to the National City Bank of New York, depository.

Fort Wayne & Springfield Railway, Decatur, Ind.—The Fort Wayne & Springfield Railway will be offered for sale on Aug. 12. Each bidder must deposit a certified check for \$5,000 and must enter into a contract to pay the balance of the purchase price within sixty days. This will be the fifth time the property has been offered for sale, there being no bidders three different times. In connection with the last sale, held on May 4, the bidder forfeited the \$1,000 deposit then made. Various petitions carrying extensions of the time and asking that the \$1,000 be protected were taken into court, but the court finally fixed upon Aug. 12 as the final date for the sale. On July 17 F. A. Dolph filed a petition asking that the line be sold to him for \$130,000 and agreed to post the guarantee then. Upon objection Mr. Dolph withdrew the offer. Previous references were made in the *ELECTRIC RAILWAY JOURNAL* of March 13, May 22 and June 19.

Jacksonville (Fla.) Traction Company.—A quarterly dividend of three-fourths of 1 per cent has been declared on the 6 per cent cumulative preferred stock of the Jacksonville Traction Company, payable on Aug. 2 to holders of record of July 23. Previous payments of 1½ per cent were paid quarterly.

Montreal (Que.) Tramways.—The new issue of \$1,000,000 of common stock for the Montreal Tramways, noted in the *ELECTRIC RAILWAY JOURNAL* of July 24, will be allotted pro rata to the holders of the \$3,000,000 of stock now outstanding; that is, one share of new will go to the holder of every three shares of old. The proceeds of the issue will be used for the general purposes of the company.

New York (N. Y.) Municipal Railway Corporation.—The Public Service Commission for the First District of New York has approved an agreement between the New York Consolidated Railroad and the Nassau Electric Railroad, by which the former leases for 999 years the terminal of the latter company at Coney Island. The consideration is

the payment of \$247,000, which the commission has authorized the New York Municipal Railway Corporation to charge against the cost of construction under the dual system contracts. In accordance with the agreement between the Consolidated Company and the Nassau Electric Company, the city and the New York Municipal Railway Corporation will agree to a modification of the dual system contract whereby the city will obtain a right-of-way for two tracks into the Coney Island terminal between Avenue Y and Surf Avenue for the use of the trains to be operated over the New Utrecht Avenue elevated railroad. The Sea Beach Railroad has already obtained the right-of-way into the terminal for its trains, so that by the new agreements trains to Coney Island through the Fourth Avenue subway, whether operated over the Sea Beach line or over the New Utrecht Avenue line, will both enter the same terminal at Coney Island.

Pacific Gas & Electric Company, San Francisco, Cal.—The Pacific Gas & Electric Company has filed an application with the California Railroad Commission for authority to buy all the capital stock of the West Sacramento Electric Company from G. F. Detrick and H. W. Furlong for \$30,000. The West Sacramento Electric Company operates in Yolo County. It has a capital stock of \$100,000, divided into 1000 shares. The stock is in the hands of the Mercantile Trust Company of San Francisco in escrow. The Pacific Gas & Electric Company obtained options from Messrs. Detrick and Furlong on all of it some weeks ago. This company already owns and operates the electric railway lines in the neighborhood of the territory owned and served by the West Sacramento Electric Company.

Puebla Tramway, Light & Power Company, Puebla, Mexico.—The holders of the \$4,229,200 of first mortgage thirty-year 5 per cent bonds of the Puebla Tramway, Light & Power Company were to vote on July 30 in London on a modification of the trust deed to make the interest on these bonds for five years from Jan. 1, 1915, payable only in the event of sufficient net earnings after providing each year for \$3,000,000 of prior lien 5 per cent bonds. Any part of such interest remaining unpaid at the expiration of the five years would be satisfied, if required, by the issuance at par of 5 per cent cumulative income warrants payable only out of profits. No dividends would be paid on the common stock until the whole of income warrants had been redeemed. Provision is also contemplated for cancelling the operation of the sinking fund for five years from Jan. 1, 1916, and for extending the date of maturity of the bonds for five years from Jan. 1, 1937. The management of the company states that the average rate of exchange for last year was less than half of the par exchange or under 1s. per peso, with the result that the earnings in sterling realized little more than the amount necessary to meet the interest on the prior lien bonds alone. The company does not expect that its earnings will for some time realize in sterling the amount sufficient to pay the interest on its first mortgage bonds.

St. Louis, Lakewood & Grand Park Railway, St. Louis, Mo.—Under an execution entered on a judgment recently given in favor of a former superintendent for salary, a levy has been made on two of the three cars of the St. Louis, Lakewood & Grand Park Railway.

Washington (D. C.) Interurban Railway.—Chief Justice Covington on July 20 authorized the sale of the Washington Interurban Railway. The trustees, J. W. Yerkes and Guy T. Scott, are to conduct the sale in accordance with the decree of the United States District Court in Maryland, where a foreclosure decree was recently entered.

Washington-Oregon Corporation, Vancouver, Wash.—The property of the Washington-Oregon Corporation, both real and personal, was advertised to be sold under sheriff's sale on July 3 to satisfy a mortgage of more than \$1,000,000, but the sale was adjourned indefinitely. Attorney Langhorn asserted that one reason for the postponement was the uncertainty existing as the result of certain franchise activities for the use of county roads being carried on by H. D. Fleischhauer, formerly manager for the Washington-Oregon Corporation. The county commissioners have been asked to refuse this grant and have decided to hold off temporarily, but until this matter is settled a stop is

placed upon the intentions of the bondholders, who are prepared to buy in the property.

West End Street Railway, Boston, Mass.—The West End Street Railway has sold to F. S. Moseley & Company, Boston, an issue of \$4,743,000 of one, two and three-year notes bearing 5 per cent interest. The notes are equally divided between the three maturities, making \$1,581,000 of each. It is understood that they were sold at a premium. Several bids, naming longer maturing notes or long-term bonds, were received, but these were rejected, as it was felt it was not advisable to load up with long-term bonds, carrying a large interest rate, which would have to be sold at a heavy discount.

DIVIDENDS DECLARED

Bangor Railway & Electric Company, Bangor, Me., quarterly, one-half of 1 per cent, common.

Bristol & Plainville Tramway, Bristol, Conn., 2 per cent.

Connecticut Railway & Lighting Company, New Haven, Conn., quarterly, 1 per cent, preferred and common.

Cumberland County Power & Light Company, Portland, Me., quarterly, 1½ per cent, preferred.

East St. Louis & Suburban Company, East St. Louis, Ill., quarterly, three-fourths of 1 per cent, preferred.

Illinois Traction System, Peoria, Ill., quarterly, three-fourths of 1 per cent, common.

Jacksonville (Fla.) Traction Company, quarterly, 75 cents, preferred.

Monongahela Valley Traction Company, Fairmont, W. Va., 2½ per cent, preferred.

Tampa (Fla.) Electric Company, quarterly, 2½ per cent.

United Power & Transportation Company, Camden, N. J., \$1.34.

Traffic and Transportation

LOS ANGELES JITNEYS DECLINING

Strict Regulation Causes Reduction in Craze—First Driver in Pasadena Quits—Interurban Bus Question Put Before Commission

Since July 12 regulation of the jitney traffic in Los Angeles, Cal., has been on a firm and solid foundation, requiring substantial bond or insurance against personal and property damage and proof that the driver meets a certain standard of competency. It is too early to state fully what the effect will be, but hundreds of jitney drivers have quit, because unable either to pay the cost of securing bonds or to pass the reasonable examinations now conducted by the police traffic officials for old and new operators alike.

The ordinance upon which the present regulation is founded is No. 31,877, mentioned in the *ELECTRIC RAILWAY JOURNAL* of March 6. This contained a requirement for a \$5,000 bond. The jitney men's association secured an injunction against its enforcement which remained in effect until after the municipal election last June. Then the injunction was dissolved by Judge Hewitt without any written opinion, and the ordinance became effective on July 1. An amendment, ordinance No. 32,518, was passed by the Council, to become effective on July 20, replacing the requirement of a \$5,000 bond by that of bond or insurance (the insurance option being new) in the amount of \$5,000 for injury or death of one person, \$10,000 for injury or death of more than one person and \$1,000 for damage done to the property of others. This insurance or bond must be approved by the police commission. The jitney-men's association has some arrangement with the Pacific Casualty Company whereby protection that is said to satisfy the ordinance is obtained by its members for \$24 down and \$8 a month. The \$24 pays for the first two months, thus making the cost of the protection \$104 a year.

Immediately after July 1 there was a great reduction in the number of jitneys on the streets. In the palmy days of the jitney craze the largest number counted in service in a day ran fairly close to 800, and in the middle of June a traffic count showed about 425 jitneys in service. After the first week in July there were less than 250 jitneys actually running. During the interval between July 1 and July 20, the police commission permitted operation by those complying with the ordinance in its original \$5,000 requirement, and leniency was shown even in the enforcement of this. On July 12, 306 drivers had filed applications with bonds, and on that day officers were instructed to arrest all who were operating without bonds.

The police traffic department is holding examinations under the ordinance. Applicants are required by a written examination to show a knowledge of rules and orders governing traffic and to pass a road test in which they are accompanied by one of the officers competent to judge their driving. There have been more than 400 applicants examined, of whom about fifty, according to unofficial reports, failed. A great many of these were weeded out by sheer illiteracy or ignorance of the English language. On July 16 the department examined sixty-five applicants, including a few held over from the preceding week. The rate at which new applications have been coming in has been declining, but it is difficult to tell when they will stop. Those who have passed the written tests have usually also passed the road tests, as most of them are men who have been operating jitneys.

The police are not troubled much by attempts to evade the ordinance. The drivers know better, and their association, after the defeat of its efforts to eliminate the bond provision, is now urging peaceable compliance with the law. One driver on the first day of the new regime was taken in for a heart to heart talk with the traffic officers after he had been operating a few hours with a little slotted box tacked up under a sign saying that his vehicle was not a jitney bus, but inviting riders to leave a donation. He promised to quit. The jitneys continue to suffer from overcrowding. It is expected that there may be some regulation of this feature, which many think will result in a wholesale quitting of the service or higher fares.

The question whether the bond requirement applies to buses in interurban traffic entering the city has been taken into court in an action by the proprietors of the "Little Landers" stage, M. Spencer and S. W. Parmenter, which will also involve other features of the ordinance. The whole question of regulation of interurban bus traffic is becoming of increasing importance, as the number of vehicles so engaged is now fairly large. These buses take only the cream of the traffic. An example is the forty cars that run from Santa Ana to the beach on Sunday, but give no service on week days when traffic is light. This subject will be put before the California Railroad Commission under an application filed on July 12 by the Western Association of Short Line Steam Railroads, requesting a determination whether buses in interurban traffic are common carriers and as such subject to the laws, ordinances, rules and regulations governing common carriers. Electric railways will undoubtedly be represented at the hearings. Up to this time the only regulation of interurban buses of interest has been that by the city of Venice, which passed an ordinance permitting the trustees at their discretion to permit buses engaged in interurban traffic to enter the city on payment of a license fee of \$100 a year. The trustees have not yet seen the necessity for issuing licenses to them. At first drivers attempted to evade the effect of this by driving to the next beach point, Ocean Park, but the number so doing has been gradually diminishing.

Some light on the troublesome question of jitney receipts is given by the retirement of C. W. Home, the first man to start a jitney bus in Pasadena, who was widely advertised in early newspaper articles as an example of success in the business. He says a good deal of his early traffic was from novelty seekers among people not accustomed to riding in automobiles. Now many people are getting tired of jitneys. He stated to a reporter: "I started in business on April 20, 1914, operating between the business portion of Pasadena and Lamanda Park. For a while I needed five cars to take care of the business, but now I cannot make a living at it."

JITNEY CONTROL REFUSED IN INDIANA

Commission Decides It Has No Jurisdiction Under Utility Act—Railway in Kokomo Establishes Bus Lines with Schedules and Transfers on Non-Car Streets

The Public Service Commission of Indiana entered an order on July 24 dismissing the petition of the Terre Haute, Indianapolis & Eastern Traction Company, which sought to bring all jitney buses in the State under the control of the commission, as noted in the *ELECTRIC RAILWAY JOURNAL* of July 17. The commission stated that it had no jurisdiction under the public utility law of 1913.

A hearing was held on July 22, at which officials of the principal street and interurban railways of Indiana appeared before the commission and joined in the petition of the Terre Haute, Indianapolis & Eastern Traction Company. John T. Beasley, attorney, appeared for that company and reviewed the petition and the progress of jitney operations up to this time. Mr. Beasley explained that the petitioners did not contemplate in any way that the jitneys should be wiped out as a competitive factor in the transportation problem, but that regulation on the same basis as the electric roads was all that was desired. He said that if in the development and advancement of this age, new and better methods of transportation are found, the commission should not be called upon to stand between one competing system and another, but it is the province of the State that the competition should be fair.

Mr. Beasley stated that while the Indiana utilities law specifies certain classes of utilities, among which the jitneys do not appear, the law refers frequently to "every public utility," "all public utilities" and "any public utility," and therefore, he argued, it was undoubtedly the intent of the legislature that the commission should have power over such a competitive agent of the traction companies as the jitney buses. Mr. Beasley quoted from decisions of other states to prove his contention that where such an act as the Indiana public utility commission law specifically refers to certain types of utilities it does not exclude from its provisions thereby others of a similar type. Commissioner

Clark asked Mr. Beasley what the commission might do in the premises, assuming that it had jurisdiction. Mr. Beasley said that it might issue an order citing all jitney bus owners to appear by counsel before the commission to formulate some method of licensing the jitneys. Commissioner Clark then expressed his opinion that the electric railway companies had the right to go into court asking restraining orders against the competing jitneys, thus getting the question judicially settled.

Ferdinand Winter, general counsel for the Terre Haute, Indianapolis & Eastern Traction Company, argued that the State has deemed it wise to prevent utilities from earning more than a fair return on an investment, and because of this the State should protect the utility from unfair competition of jitney buses, so that it might earn this amount.

After the decision the Indiana Railways & Light Company, operating the local lines in Kokomo, Ind., announced that it would establish two lines of jitney buses which will operate in portions of the city not now served by street cars. A regular schedule will be maintained and transfers will be given to the street cars, so that passengers may go to any part of the city for a 5-cent fare.

MOTOR BUSES FOR BALTIMORE

W. A. House, president United Railways & Electric Company, Baltimore, Md., stated on July 22 that his company was interested in the Baltimore Transit Company, which will place a number of motor buses in service on the streets of Baltimore. Mr. House said that the railway's interest in the establishment of this service is due to its desire to see a bona-fide effort made to ascertain whether or not that method of transportation is a desirable supplement to the present methods, and that its future action would depend on this demonstration. He added: "It has been shown by the experience with that type of vehicle elsewhere that, as now operated, they cannot be made to pay, and except where operated on a 10-cent fare they have gradually disappeared from the transportation field. It has not yet been demonstrated, however, whether or not they can be operated successfully as supplementary to street railway traffic. We are extremely doubtful as to whether they can, but we shall find out as a result of this experiment."

The Baltimore *Sun* states that the Baltimore Transit Company has an authorized capital of \$100,000 and that it is having more than a score of buses made for it by The J. G. Brill Company, Philadelphia. William H. McKee, Philadelphia, is now in Baltimore as the general manager of Baltimore Transit Company.

JITNEY ORDINANCES RECENTLY PASSED

Wichita, Melrose, Ashtabula, San Diego, Leavenworth and Bridgeport Assume Regulation of Jitneys—Supplementary Ordinance in Dallas for "Rent" Cars

The city of Wichita, Kan., on July 15 passed a jitney ordinance to take effect after Aug. 1. The feature of this ordinance is the inducement offered to keep jitneys off streets occupied by car lines. No one operating a jitney may solicit or receive passengers on car streets (though they may travel on such streets) unless the owner shall pay an additional license fee of \$300 a year for five-passenger vehicles, \$350 a year for vehicles carrying from five to ten passengers and \$400 a year for vehicles carrying more than ten passengers. All other streets may be traversed at will, provided the operators designate the route to be traversed and publish in some public manner the time of departure from the designated terminal corner for all jitneys. The regular city license for jitneys payable annually is \$25 for a five-passenger car, \$35 for a ten-passenger car and \$50 for more than a ten-passenger car. No jitney will be allowed to carry more passengers than the license designates, and only one passenger may ride on the front seat.

Melrose, Mass., has adopted a jitney ordinance, the feature of which is that under no consideration shall the seating capacity of the car as planned by the maker be overtaxed. In applying for a license the applicant is required to show proof of the seating capacity of his automobile as given by the maker, pay a fee of \$1 for a license and file an indemnity bond of \$5,000.

In an effort to escape compliance with the jitney ordi-

nance of Dallas, Tex., which was enforced on July 19, providing for a license fee of \$75, members of the jitney union made preparations to take down their street signs and operate their cars as before, but under the guise of rent automobiles at the license of \$10 provided for rent cars. This evasion was thwarted by the city officials through the creation of another ordinance which prohibits the solicitation of patronage by operators of automobiles for hire other than a motor bus as "motor bus" is defined in the jitney ordinance. The new ordinance stipulates that an operator of an automobile for hire shall be considered as soliciting patronage if he shall announce by voice, sign, writing, color scheme, symbol or advertisement, other than the license number plate, that such automobile is used for transporting passengers for hire. This emergency ordinance compelled compliance with the jitney ordinance, and the day following its enforcement there was no attempt to operate. Efforts to have this ordinance declared unconstitutional failed.

The jitney ordinance in Ashtabula, Ohio, was declared valid on July 12 by Common Pleas Judge A. C. Reynolds. Every point on which the ordinance was attacked by jitney operators was decided in favor of the city. This decision ends a long struggle in Ashtabula. The first ordinance passed by the Council was declared invalid by an acting police judge. On June 7 another ordinance was presented in Council which passed under suspension of rules and became effective on June 15. This also was declared invalid by the police judge, after which the jitney drivers had full sway until this decision by Judge Reynolds. The court decided that the requiring of a license fee of \$25 was a proper exercise of the police power and the license itself was neither excessive nor unreasonable. The bonds of \$3,000 for less than nine-passenger cars and \$5,000 for nine-passenger cars were declared to be within the authority of the city in protecting the public and injured persons. The court held that the operation of the jitney is itself a legitimate business, but that unless it was controlled irresponsible persons would engage in it to the danger of passengers and pedestrians.

After one ordinance had been declared unconstitutional as the result of injunctions secured by the jitney drivers, Mayor Tapps of San Diego, Cal., on July 2 approved a second ordinance passed by the Common Council. This ordinance provides for an application for an auto-bus permit by the owners or lessees of cars, the application to state the routes to be followed, the fare, the schedules, the transfer points, the type of vehicle, the seating capacity and the like. The car owner or lessee must file a bond or insurance policy of \$10,000 to cover accident and damage settlements and pay a license fee of \$10 for each jitney seating five or less passengers, \$15 for one seating more than five and less than eight passengers, \$25 for one seating more than seven and less than sixteen passengers, and \$40 for one seating more than sixteen passengers. Jitney operators must submit to an examination and pay a license fee of \$1. No licenses to operate will be granted to any persons under eighteen years of age. The jitneys are prohibited from running off the prescribed routes, cutting schedules, raising the rates of fare and refusing firemen and police free transportation. Violations are punishable by a fine of not more than \$100 or imprisonment for not more than three months, or both.

The Leavenworth (Kan.) city commissioners on July 20 passed a jitney ordinance requiring a license of \$100 a year and a bond of \$10,000. The jitneys must run on a regular schedule and a fixed route.

An ordinance for the regulation and licensing of jitneys went into effect in Bridgeport, Conn., on July 1. This ordinance provides that each jitney shall be licensed by the superintendent of police, the fee being \$10 for the original license and \$10 for each renewal for vehicles and 50 cents for drivers. The superintendent of police is empowered to require a demonstration by each applicant for a driver's license. No riding is allowed on the steps, hoods or doors of the jitneys and not more than three passengers above the actual seating capacity may be carried at any time. A violation of any provision of the ordinance is punishable by a fine of not more than \$100. It is provided that the ordinance does not apply to any motor vehicle whose minimum charge is more than 10 cents.

JITNEY JOTTINGS

Jitneys in Kansas City Meet Rebuff—Memphis Railway Asks Injunction—Bristol Company Buys Buses for Jitney Service

The jitney situation in Kansas City, Mo., became acute last week, when the White Star line of buses raised its fare to 10 cents and discovered that the people would not pay this amount. They maintained this rate for a few days and then suddenly restored the 5-cent fare. After the failure of the Kansas City Jitney Transportation Company, noted in the *ELECTRIC RAILWAY JOURNAL* of July 24, plans for a coalition of jitney forces, abandoned several weeks ago because of lack of support, were taken up and met with hearty response. The Rapid Transit line got 100 adherents in a few days. This company had already leased a lot 50 ft. x 115 ft., at 1318 Walnut Street, erected a tent and arranged gasoline stations and small facilities for parking cars. It is now the plan to erect a building, with docks extending the long way of the lot, the cars to pass along one dock inward and out by way of the other. The ingoing and outgoing cars will be separated by a low curbing, the docks being on the outside of the runways. There will be plenty of seats on the docks, and outside the north and south walls will be concessions.

The Memphis (Tenn.) Street Railway on July 17 filed a bill in chancery to enjoin every jitney owner now operating in Memphis. It is asserted that the jitney drivers are operating without having given bonds as required by the recent Legislative act, without license, permit or franchise, and are using the streets without lawful authority, control or regulation of any kind. Jitney corporations and owners to the number of 316 are made defendants. The alleged infringement on the franchise rights of the railway is said to be causing the company a daily loss of \$750 to \$1,000.

The United States Circuit Court at Memphis on July 17 denied an injunction sought to void on constitutional grounds the Tennessee statute requiring jitney operators to furnish an indemnifying bond. It was held that the Tennessee act was not violative of the fourteenth amendment of the federal constitution. The opinion is contrary to the decision of Judge Pittman of the State Court, whose ruling was that the act was unconstitutional on account of being class legislation. An appeal from Judge Pittman's decision is pending. Aside from the moral effect on the appealed case, the federal decision simply confines the case to State litigation.

The Bristol (Tenn.) Traction Company has put a 1915 Buick jitney bus in service to supplement its railway lines and is reported to have purchased other automobiles to enter the service. Half a dozen cars have been bought and put into service by the local jitney company, which is composed of business men. The routes have been definitely laid out and the cars are operated on a schedule.

Claiming that jitney competition has seriously affected its business, the Charleston (W. Va.) Interurban Railroad has asked the Public Service Commission to allow it to discontinue traffic on two of its lines, one of them an interurban.

Judge Robert G. Street of the Fifty-sixth District Court at Galveston, Tex., on July 14 denied the petition of the Texas City-Galveston automobile line for an injunction to restrain the city officials of Galveston from enforcing a regulatory ordinance requiring bus licenses and an indemnity bond on each bus to the sum of \$10,000. Judge Street held that in the enforcement of the ordinance there was no violation of any vested rights of the petitioners for using the streets and alleys of Galveston, and that they were subject to the ordinance notwithstanding the fact that they did not operate between points within the city.

The Philadelphia Jitney Association on July 22 unanimously voted against the six-for-a-quarter strip tickets which were recently adopted by the Auto Service Association, the South Philadelphia Jitney Owners' Association and the West Philadelphia Jitney Association, as noted in the *ELECTRIC RAILWAY JOURNAL* of July 24. As a result of this decision the tickets will be good on only about two-thirds of the jitney lines of Philadelphia. The Philadelphia Jitney Association also passed a resolution that no jitney driver could belong to both it and the Auto Service Association, which will cause 300 men to desert one of them.

The Des Moines ordinance for the regulation of jitney buses was declared valid this week in the District Court. The Court holds that the city has a right to regulate the operation of jitneys and to require an indemnity bond as the ordinance provides. The only portions of the ordinance held invalid are the sections requiring that jitneys take on or discharge passengers within 2 ft. of the curb and that they be halted behind street cars or other jitneys taking on or discharging passengers. The section of the present ordinance requiring bonds is also faulty, because it does not insure a proper bond. This defect of the ordinance will be remedied by the city at once. Recent investigations show that the number of jitneys being operated in the city has fallen below thirty.

I. C. C. DECIDES TRAFFIC CASE

Commission Specifies Basis of Haul Division and Prorating of Joint Rates for Insull Lines Between Louisville and Indianapolis

After a long controversy between the Board of Trade of Louisville, Ky., and the three Insull lines which together make up the route from Louisville to Indianapolis, the Interstate Commerce Commission on July 23 handed down an order apportioning between the three roads the rates to be charged on shipments of freight north from Louisville. The contentions also involved the matter of adequate terminal facilities in Louisville, and the commission directed in favor of the Board of Trade.

The commission's order provides that the through rate between Louisville and Indianapolis shall be divided into three parts, the haul being from Louisville to Seymour, from Seymour to Sellersburg and from Sellersburg to Indianapolis. As between these parts, the joint rates shall be prorated on a mileage basis, with a minimum division of 20 per cent to the Indiana Public Service Company, a like minimum division to the Indianapolis & Louisville Traction Company, and a like minimum division in the aggregate to the Louisville & Southern Indiana Traction Company and the Louisville & Northern Railway & Lighting Company for their services south of Sellersburg. The last-named two lines, however, shall have an arbitrary allowance before prorating, on account of Ohio River bridge conditions and terminal conditions, of 1 cent per 100 lb. on less-than-carload shipments, and one-half of 1 cent per 100 lb. on carload traffic, this arbitrary allowance to be included in the minimum 20 per cent division and not to be added to it. By the ruling the basis of divisions and minima shall also govern the apportionment of joint rates applying between Louisville and points on the Indianapolis & Louisville Traction Company line.

This finding means a great deal to the Louisville shippers and is expected to result in an increased volume of freight to the railway companies. Heretofore Louisville shippers have been unable to bill shipments through north of Seymour, although shippers in and north of Indianapolis were able to bill through to Louisville and electric railway points beyond. Traffic by electric railway north of Seymour meant many changes and many bills for the three lines were unable to agree on a division of the rates. As a result the traffic was virtually little or nothing. The basis of division is now specified, and the Louisville Board of Trade will take up with lines north of Indianapolis the matter of through rates from Louisville, heretofore made impossible by reason of the deadlock south. No difficulties are expected in working out these schedules, and through rates would open up a wide and rich territory to Louisville, reaching from Chicago through Toledo, Detroit, around to Cincinnati.

Interurban and Steam Lines Running Excursions.—The Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., is running popular excursions to St. Louis in connection with the Toledo, St. Louis & Western (Clover Leaf) Railroad. The business is handled via Bluffton, Ind.

Holding Cars for Transfer Passengers.—The cars of the Louisville (Ky.) Railway are being held at intersecting points until it is certain that there are no passengers wishing to transfer from cars on the cross lines. There was some disposition at first to complain about delays through

such waiting, but this kind of service now has the full support of the people who ride on the cars. Visitors to the city write letters to the local papers expressing their approval of this practice and speaking of the distinction it gives the service. It has not been found that waits of this kind slow up the traffic appreciably.

June Accidents in New York City.—The engineers of the Public Service Commission for the First District of New York have completed the tabulation and classification of all accidents reported by railroad and street railway companies in the district for June. They show a total of twenty-three persons killed, which is exactly the number killed in June of last year. Of these fatalities eight occurred on the surface lines, eight on subway and elevated lines, six on railroad trunk lines, and one on railroad terminal lines. The total number of accidents decreased from 6466 in June, 1914, to 6148 in June, 1915.

Joplin & Pittsburgh Line to Develop Carload Freight.—The appointment of a traffic manager, J. D. Cornell, by the Joplin & Pittsburgh Railway, noted in the issue of July 24, prefaces active efforts for carload business. Heretofore the line has done considerable freight business, but mostly in broken carloads, handled by the baggage or freight cars of the company. Through rates and divisions are being arranged on all commodities from Kansas City, the Missouri River and defined territory to all points on the Joplin & Pittsburgh Railway. It is expected that preliminary details, such as agreements with steam roads, publication of rates and approval by the commission, will be completed so that the extended business can begin to flow by Sept. 1.

Petition for Extension of Fare Limits Refused.—The Massachusetts Public Service Commission has refused to grant a petition of the Selectmen of Rockland for the extension of transfer privileges on the Bay State Street Railway within the town. The general grant noted in the *ELECTRIC RAILWAY JOURNAL* of July 24 had reference to the consent of the company to extend the privileges of an existing 7-cent workman's ticket, good at certain hours only, between Rockland and Brockton to all parts of Brockton. This offer was made by the company pending a decision upon the application which it expects to make for a general revision of fares as a result of the recent arbitration award. In refusing to grant a general free transfer in Rockland, the commission pointed out that passengers boarding a car in any part of Rockland would be able to ride to Brockton or vice versa for 10 cents.

An Investigating Committee Satisfied.—Representatives of the transportation committee of the Louisville Commercial Club recently called on Walter Foreman, superintendent of the Louisville & Northern Railway & Lighting Company and the New Albany (Ind.) city lines, to take up a protest made at a recent club meeting about poor freight and express service between New Albany and Louisville. Mr. Foreman satisfied the committee that other circumstances than the delivery system were responsible for delays complained of, and incidentally disclosed the elaborate preparations that had been made to give Louisville merchants a first-class service with the towns across the river. The freight cars of the Louisville & Northern line and those of the Louisville & Southern Indiana Traction Company operate as frequently as the volume of traffic justifies and this service would be increased if the demand for it developed sufficiently. It was possible, in fact unavoidable, Mr. Foreman stated, that bulky freight shipments which were not delivered until after 5 p. m. would not reach the other side until the next morning, but freight in packages of less than 100 lb. was normally delivered in New Albany in forty-five minutes, and similarly in Jeffersonville, while equally quick service is given in Seymour, Columbus, etc., on small freight from Louisville. The cars for a large part of the day are run on a fifteen-minute schedule, while except at night the service is never slower than half hourly. The motor trucks of the company make collections and deliveries in the business section of Louisville, from the river to Broadway and from Shelby to Fifteenth Street; and collections and deliveries are made to all points of the Indiana cities across the Ohio River. After hearing these facts, the committee recommended a larger use of the service available.

Personal Mention

Mr. T. J. Collins has been appointed assistant superintendent of the Eastern Pennsylvania Railways, Pottsville, Pa.

Mr. C. D. Willoughby has been elected vice-president of the Mobile Light & Railroad Company, Mobile, Ala., to succeed Mr. J. H. Whiting.

Mr. E. S. Gillette, formerly assistant engineer of the Aurora, Elgin & Chicago Railroad, Wheaton, Ill., has been appointed electrical engineer to take up part of the duties made vacant by the resignation of Mr. E. F. Gould, noted elsewhere in this column. Mr. Gillette will have charge of the shop, power house, substation and line departments.

Mr. J. Dunhill, secretary of the Trinidad Electric Transmission, Railway & Gas Company, Trinidad, Col., has been elected treasurer of the company to succeed Mr. L. C. Gerry. Mr. J. B. Marsh has been elected secretary of the company to succeed Mr. Dunhill.

Mr. E. R. Peacock has been appointed president of the Barcelona Traction, Light & Power Company, Ltd., Barcelona, Spain, to succeed the late Mr. F. S. Pearson. Mr. Peacock will have charge of the financial arrangements of the company.

Mr. C. F. W. Wetterer of Stone & Webster, with headquarters at Boston, is now assisting Mr. C. F. Wallace, now at Dallas, Tex., in charge of the Stone & Webster interests there. Mr. Wetterer was formerly secretary to Mr. M. H. Phinney of Stone & Webster.

Mr. J. J. Callahan, formerly superintendent Montreal & Southern Counties Railway, Montreal, Que., was on July 15 named operating manager of the London & Port Stanley Railway, London, Ont., which is now being run by hydro-power by the city of London.

Mr. H. S. Cooper, who has been the energetic secretary of the Southwestern Electrical & Gas Association for the last three years, has opened an office as consulting and advisory engineer at Dallas, Tex. This makes no change in his office as secretary of the association. In his new work Mr. Cooper will specialize on the construction, operation, and maintenance of electric railways, lighting, gas, and waterworks properties, not only in engineering cases but in matters of public policy. He has been very actively connected with work of this kind for the last twenty years or more, first in Schenectady, N. Y., then in Ithaca, N. Y., and later in Galveston, and he has been conspicuously successful in rehabilitating poorly-paying properties and in putting them on a sound financial basis.

Mr. E. F. Gould has resigned his position as assistant general manager and mechanical and electrical engineer of the Aurora, Elgin & Chicago Railroad, Wheaton, Ill., to become consulting engineer in the Cleveland office to act in a supervisory capacity over all the properties in which Mandelbaum, Wolf & Lang are interested. Mr. Gould has been with the Aurora, Elgin & Chicago Railroad since 1903, first as a mechanical and electrical engineer and later as assistant general manager and engineer. He designed and built all additions and improvements to plant and equipment and paid special attention to power economies. Prior to 1903 he spent four years in the railway engineering department of the General Electric Company at Schenectady. For the last few years Mr. Gould has been consulting engineer for the Western Ohio Railroad, Lima, Ohio, one of the properties owned by Mandelbaum, Wolf & Lang.

OBITUARY

Samuel E. Vincent, author of the Connecticut public utilities commission act, died at his residence in Bridgeport, Conn., on July 19.

J. Frank Chapman, who was general manager Thousand Islands Railway and Oshawa (Ont.) Railway, died at his home in Gananoque, Ont., on July 19 at the age of fifty-two. When seventeen years of age he entered the employ of the Thousand Islands Railway as junior clerk, from which position he rose to be chief executive. He was president of the Canadian Freight Association for one year.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Corpus Christi Traction Company, Corpus Christi, Tex.—Incorporated in Texas to construct an interurban railway in and out of Corpus Christi north, west and south. Capital stock, \$100,000. Incorporators: J. S. Caswell, San Diego; J. R. Hopkins, W. G. Blake, Orlan P. Metcalf, Gordon Boone and W. E. Pope, all of Corpus Christi, and Arthur McEvoy, New York City. [July 17, '15.]

FRANCHISES

***Los Angeles, Cal.**—P. D. Cornelius has received a twenty-one-year franchise from the Council to construct an electric railway on Brooklyn Avenue, Evergreen Avenue and Wash Avenue, Los Angeles.

Los Angeles, Cal.—The Pacific Electric Railway has received a franchise from the Council to construct an extension of its lines across the Shoe String Strip.

San José, Cal.—The Council of San José has passed a resolution to grant a franchise for the construction of a line on Alum Rock Avenue requested by the San José Railroads. Bids for the franchise will be received by the Board of Supervising Engineers until Sept. 7, 1915.

***Clearwater, Fla.**—E. W. Parker, Tampa, and associates have received a franchise to construct an electric railway in Clearwater and vicinity.

***Baltimore, Md.**—The Idlewyde Park Railway has received a franchise from the Council to lay tracks on Register Avenue from the York Road to Idlewyde Park. This railway will connect with the tracks of the Towson and Catonsville division of the United Railways & Electric Company.

Springfield, Mass.—The Springfield Street Railway has received a franchise from the Council to construct a railway from East Springfield to Chicopee.

Buffalo, N. Y.—The Council of Buffalo has adopted a report granting a franchise to the International Railway to lay a special track on Michigan Avenue and Ohio Street, subject to the consent of the Lackawanna Railroad.

Utica, N. Y.—The New York State Railways will ask the Council for a franchise to extend its Elm Street line eastward on James Street, Utica.

Wilkes-Barre, Pa.—The Wilkes-Barre Railway has received a franchise from the Council to lay tracks on East North Street between North Main Street and North Pennsylvania Avenue. This track will be used by the Parsons, East End and Miner's Mills cars for temporary service during the construction of a new sewer on North Pennsylvania Avenue.

TRACK AND ROADWAY

Columbus, Ark.—Work has been resumed on the proposed electric railway between Columbus and Washington, Ark., after having been suspended last fall on account of financial conditions. It is expected that the roadbed will be ready for the ties and rails inside of six weeks. Rufus S. Stout, Pine Bluff, is interested. [May 1, '15.]

Connecticut Company, New Haven, Conn.—This company has agreed to pay \$1,250 toward the construction of a new bridge over Summer Creek, Hartford, and work will be begun at once. The bridge will be 65 ft. long and 32 ft. wide, with a roadway of 26 ft. and 6 ft. for pedestrians. A temporary bridge will be constructed for use while the new bridge is being built.

Washington Railway & Electric Company, Washington, D. C.—Work has been begun by this company improving its tracks in Anacostia and placing its power underground.

Clearwater, Fla.—Work will soon be begun on the proposed electric line from Brooksville to St. Petersburg, via Clearwater. Construction will be begun at Brooksville and will extend southward. It is expected that the line will be completed as far as Clearwater by Nov. 1. James Murphy, St. Petersburg, is interested. [Nov. 7, '14.]

Lewiston-Clarkston Transit Company, Lewiston, Idaho.—Announcement has been made that this company plans to extend its lines in Lewiston about 1 mile and its lines in Clarkston about 1 mile at an estimated cost of from \$75,000 to \$100,000. Preliminary surveys have been made.

La Salle County Electric Railroad, Chicago, Ill.—Plans for the construction of this company's line have been submitted to the Public Utilities Commission of Illinois. The contemplated road will connect Ottawa and Mendota. [July 17, '15.]

***Peoria, Ill.**—Peoria financiers are interested in a proposition to construct an electric railway from Peoria to Galesburg. The route will probably be via Peoria and Farmington, to connect with the Illinois Central Electric Railway extending south from Galesburg into Fulton County.

Peoria (Ill.) Railway.—Material has been received and work will be begun at once by this company relaying its tracks on Second Avenue from Franklin Street to State Street, Peoria.

Tri-City Railway Company of Illinois, Rock Island, Ill.—This company expects to have its new Fourth Street line in operation within the next thirty days. The rails being used are of the heaviest type.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—This company is considering the construction of a line to Spencer Park, Logansport.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—This company will lay an additional track on Indiana Avenue, Indianapolis, from West Street to Blake Street.

Lafayette & Northwestern Railway, Lafayette, Ind.—The people of Rensselaer, Ind., voted down a proposition to give a 2 per cent subsidy, amounting to \$60,000, for the construction of this company's line through Rensselaer. [April 3, '15.]

Louisville & Southern Indiana Traction Company, New Albany, Ind.—In connection with the improvement of Market Street from the Chicago, Indianapolis & Louisville Railway to Vincennes Street this company will replace its T-rails with girder rails.

Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa.—Homer Loring, president of this company, announces his relinquishment of stock control of the Crooked Creek Railroad between Lehigh and Webster City. He says he has given up the idea of electrifying the line, although he has not abandoned the project for an electric line from Fort Dodge to Webster City. The contract for new \$70,000 terminal buildings at Fort Dodge has been awarded and work is now in progress. Work has been begun on a new \$50,000 warehouse at Fort Dodge.

Ottumwa Railway & Light Company, Ottumwa, Iowa.—A petition will soon be presented to this company by the residents of Ottumwa for the extension of its Court Hill line north about 1½ miles.

Hutchinson (Kan.) Interurban Railway.—Plans are being made by this company to use steel ties in the construction of its track on South Main Street and Second Avenue East. The base of the right-of-way under the pavement will be of concrete. Under each rail, extending lengthwise of the street, will be a section of reinforced concrete on which the steel ties will rest.

Lowell & Fitchburg Street Railway, Ayer, Mass.—This company has asked the Public Service Commission of Boston for its approval of the extension of its tracks on Main Street and West Main Street, Ayer, across the Boston & Maine Railroad tracks to connect with the Ayer terminus of the Shirley-Ayer line of the Fitchburg & Leominster Street Railway.

Bay State Street Railway, Boston, Mass.—This company has completed the work of laying new double track on its line on Lakeview Avenue, Dracut.

Boston (Mass.) Elevated Railway.—Work has been begun by this company laying new tracks on Washington Street, Brookline.

Worcester (Mass.) Consolidated Street Railway.—This company has completed the work of relocating its tracks in Wood Square, Marlboro.

Detroit (Mich.) United Railway.—Work will be begun at once by this company on the construction of an extension into the Fourth Ward. The line will connect the west side with other car lines in the city.

Fallon (Nev.) Electric Railway.—Work has been resumed by this company on the construction of its line from Fallon to Sand Springs, 30 miles. The roadbed is completed as far as the heavy grading, cuts and fills are concerned, and work at present will be confined to trimming up the grade to get ready for the laying of ties and tracks. It is expected that track-laying will be begun within the next sixty days. Mayor E. S. Berney and Dr. C. A. Hascall are interested. [Dec. 19, '14.]

***Landing, N. J.**—Decision to build a new electric line from Landing to Lake Hopatcong and thence through Fort Morris to Netcong was reached on July 20 at a meeting in Pittsburgh of officials of the Morris County Traction Company. While this new railroad will be virtually under the management of the Morris County Traction Company it was decided for financial purposes to form a separate company, the name of which has not been selected. It is proposed to pay 5 per cent of the gross income to the municipalities through which the new line will pass. Roxbury Township has already granted the franchise from Landing through Port Morris, but the question has not yet come up before the Netcong officials.

***Salem, N. J.**—Plans are being considered to construct an electric railway from Salem to Pennsgrove. Among those interested are Arthur B. Smith, Harry G. Hart, Isaac C. Smashey, James S. Wheeler and Wesley F. Sinnickson.

New York, N. Y.—Bids were opened on July 27 by the Public Service Commission of the First District of New York for the construction of Section 3 of Routes No. 4 and 36. This section begins at Thirty-eighth Street, New York, and runs north under Broadway to Forty-second Street, where it crosses under the line of the existing subway and continues north through Seventh Avenue to Fifty-first Street. The lowest bid was that of Holbrook, Cabot & Rollins Corporation for \$3,741,000. Bids were also opened for the construction of Section 3 of Route No. 12, which runs under Eastern Parkway, Brooklyn, from Nostrand Avenue to Buffalo Avenue. The lowest bid was that of Rodgers & Hagerty, Inc., for \$2,170,000. The Broadway subway is to be operated by the New York Consolidated Railway under contract between the city and the New York Municipal Railway Corporation. The Eastern Parkway subway will be operated by the Interborough Rapid Transit Company as an extension of the existing subway. Bids were also opened for the supply of 2200 tons to 3000 tons of manganese rails to be used on the new subway and elevated lines to be owned by the city, for which the lowest bid was that of Manganese Steel Rail Company, \$263,591.

Niagara River & Eastern Railway, Niagara Falls, N. Y.—Briefs were filed by this company on July 20 with the Public Service Commission for the Second District of New York, supporting its petition for permission to build a double track fast freight and passenger line from Lockport to Niagara Falls to connect with the Buffalo, Lockport & Rochester Railway and the International Railway. Connected with this plan is the proposition to double track the Buffalo, Lockport & Rochester Railway. [April 10, '15.]

Goldsboro Electric Railway, Goldsboro, N. C.—This company reports that it expects to build 1 mile of new track in Goldsboro.

Cleveland (Ohio) Railway.—Peter Witt, street railway commissioner of Cleveland, stated on July 21 that the Buckeye Road line will be extended from East 116th Street to East 130th Street and the Woodland Avenue line from East 122d Street to East 130th Street. Work will be completed by Dec. 1.

Cleveland, Akron & Canton Terminal Railway, Cleveland, Ohio.—Engineers will begin work within the next few days along the route of this company's proposed subway under East Fifty-fifth Street, preparing plans, specifications, and estimates covering the construction of the subway, freight stations, docks, and water front development. The Foundation Company of New York and the Osborne Engineering Company have received the contract. O. C. Barber, Barton, president. [July 24, '15.]

Lehigh Valley Transit Company, Allentown, Pa.—Plans are being made by this company to lay a second track along Broad Street, West Bethlehem, near Twelfth Avenue.

Schuylkill Electric Railway, Pottsville, Pa.—The contract for the grading and laying of track on this company's line over Broad Mountain has been awarded to the Trexler Contracting Company, Reading. The railway will connect Pottsville, Frackville, and Shenandoah, and will form a complete line between Pottsville and Shamokin. The rails to be used will be of the heaviest type.

***Alexandria, Tenn.**—The voters of Alexandria and the rest of DeKalb County will vote on Aug. 12 on a \$150,000 bond issue as its contribution to an electric railway that is projected to run through DeKalb County and Wilson County. The Nashville, Chattanooga & St. Louis Railway plans to electrify its road from Nashville to Lebanon, to connect with the extension which is planned to run from Lebanon via Watertown, Alexandria, Liberty, and Dowelltown to Smithville.

Northern Texas Traction Company, Fort Worth, Tex.—This company plans to extend its Summit Avenue line for more than half a mile beyond the present terminus, Willing Street and Folsom Avenue. The line will extend west on Folsom Avenue to Gordon Street and south on Gordon Street to the old belt line tracks. About 2500 ft. of the extension will be beyond the city limits.

Wheeling (W. Va.) Traction Company.—This company is placing new ties and rails on Eoff Street, Wheeling, between Twenty-seventh Street and Twenty-ninth Street, and laying new brick between the tracks.

Waupaca Electric Light & Railway Company, Waupaca, Wis.—A report from this company states that it expects to install a small signal equipment some time before fall.

SHOPS AND BUILDINGS

Illinois Traction System, Peoria, Ill.—The Public Utilities Commission of Illinois has approved the plans for a joint station to be built by this company and the Chicago & Eastern Illinois Railroad at Glover, Ill.

Arkansas Valley Interurban Railway, Wichita, Kan.—This company has purchased the property opposite the railway junction at Burrton for its new interurban station.

Electric Short Line, Minneapolis, Minn.—Bids will be opened shortly by this company for the construction of a new passenger station at Seventh Street, Holden Street, and Third Avenue N., Minneapolis.

New York State Railways, Rochester, N. Y.—Plans have been completed and work will soon be begun by this company on the construction of a new terminal at Glen Haven.

Goldsboro Electric Railway, Goldsboro, N. C.—A report from this company states that it has awarded a contract to Glisson & Sons for the construction of a new carhouse in Goldsboro.

Oregon Electric Railway, Portland, Ore.—Among the improvements contemplated by this company is the construction of an extension to its freight sheds in Eugene which will almost double their capacity, and a warehouse 50 ft. x 100 ft. at Harrisburg.

POWER HOUSES AND SUBSTATIONS

Manchester Traction, Light & Power Company, Manchester, N. H.—J. H. Mendell Company has begun work on the construction of this company's Brook Street substation and on the auxiliary steam power plant at Kelley's Falls. Construction will soon be begun on its substation at Garvin's Falls. The Brook Street substation will be 145 ft. x 100 ft. and 64 ft. high. The generators will have a capacity of about 3500 kw. The Garvin's Falls substation will be 42 ft. x 70 ft. The Kelley's Falls plant will be 144 ft. x 44 ft. and 75 ft. high, and will be added to the recently completed substation, forming an L. This plant will generate 10,000 hp. All the buildings will be of brick and cement construction. It is expected that the cost of these improvements will be about \$300,000.

Union Light, Heat & Power Company, Fargo, N. D.—This company has placed an order through H. M. Bylesby, Chicago, for two 1875-kva., 2300-volt, 3600 r.p.m. turbo-generator units. The apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Manufactures and Supplies

ROLLING STOCK

Humboldt Transit Company, Eureka, Cal., is remodeling its cars for pay-as-you-enter service.

San Francisco Municipal Railway, San Francisco, Cal., has received sealed bids for furnishing and delivering a work car.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., is considering the purchase of some new observation cars for interurban use.

Corpus Christi & Ward's Island Railway, Corpus Christi, Tex., a new line which is under construction between Corpus Christi and Ward's Island, is contemplating storage battery service and is figuring on a 25-ton storage battery locomotive to handle the movement of truck farming products in that section, the locomotive to be capable of handling 100,000 lb. in weight at a speed of 15 m.p.h. on level track.

Richmond & City Point Transportation Company, Richmond, Va., J. C. Robertson, has made arrangements with the Tidewater & Western Railroad for passenger operation over the latter's line in connection with the Virginia Railway, Light & Power Company to operate storage battery service to Bermuda Hundreds and thence by ferry to Dupont City, Va., the population of which latter city has increased from 18 inhabitants to 17,000 since the Dupont powder plant was built there.

Public Service Railway, Newark, N. J., has begun work in its shops on the construction of a closed car for city service. The length over bumpers will be 50 ft. 10 in., or 5 ft. longer than the standard cars now in service. Body length will be 36 ft. 6 in. Other details will be as follows: steel underframe, steel sides up to belt rail, tee-iron carlins, no bulkheads, longitudinal seats, compromise-type roof, with Agasote roofing and no inside lining, Standard Steel trucks, Westinghouse motors and Westinghouse HL control.

Maryland & Pennsylvania Railroad, Baltimore, Md., a steam road, has leased a storage battery car of the Railway Storage Battery Car Company, New York, N. Y., for trial operation under its regular passenger 75-minute schedule between Belair and Baltimore, 26.3 miles. The car will make three round trips per day, hauling a 30-ton trailer. The average grade on the line is 2.19 per cent, the maximum 5 per cent; there are also a great number of curves. If this car meets the requirements of service this railroad contemplates storage battery operation for the entire passenger service between Belair and Baltimore by equipping the line with five more cars.

TRADE NOTES

Curtain Supply Company, Chicago, Ill., has received orders to equip with its curtain fixtures and rollers the new cars recently ordered by the Corpus Christi & Interurban Railway, New York & Queens County Railway and Norton & Taunton Railway.

Esterline Company, Indianapolis, Ind., has received orders for "Golden Glow" headlights for the following electric railways: Metropolitan Street Railway, Kansas City, Mo., twenty SM-95 headlights; Beaumont (Tex.) Traction Company, fourteen SM-95 headlights; Binghamton (N. Y.) Railway, fourteen SM-95 headlights; Georgia Railway & Power Company, twenty-four SR-95 headlights, and New York & Queens County Railway, twelve SE-95 headlights.

Block Folding Step Company, Louisville, Ky., which proposes to manufacture and market a folding step for street cars and other vehicles, has been incorporated in Louisville with \$5,000 capital stock. The authorized bonded indebtedness is \$20,000. Incorporators are Rollie A. Jackson, Owensboro, Ky., and William H. Bartlett and William A. Rosenfield, Louisville. Morton Yonts of O'Doherty & Yonts, 906 Inter-Southern Building, is also interested. Plans of the company are indefinite as yet.

Electric Materials Company, North East, Pa., has been formed for the purpose of manufacturing electric machinery and repair parts, such as commutators, trolley wheels, line material, copper, bronze and brass castings, and drop forgings in copper and steel. The plant at North

East is of brick and steel construction and occupies 15,000 sq. ft. of floor space. The officers of the company are: President, G. E. Pierce; vice-president, F. B. Moorhead; treasurer, O. C. Hirtzel; secretary, N. P. Fuller. A sketch of Mr. Hirtzel's business career was published last week. This item is a correction of one in last week's issue in which an error was made in the name of the company.

Lord Manufacturing Company, New York, N. Y., announces the resignation of E. A. Lightner as manager to become president of Thompson, Brown & Company, educational publishers. The latter firm is the oldest publisher of school textbooks in the country, having been organized in 1844 at Boston. The headquarters will hereafter be in New York. Mr. Lightner became connected with the Lord Manufacturing Company in 1912 as sales manager and secretary. In 1913 he became general manager and treasurer. He will continue to serve on the board of directors. C. W. Horne, who has been chief engineer of the company for the past year, has been made general manager. Mr. Horne was formerly engineer of tests for the Interborough Rapid Transit Company. He is president of the Horne & Crane Engine Company, whose automatic train stop and speed control device is being tested by the Central Railroad of New Jersey.

ADVERTISING LITERATURE

Roller-Smith Company, New York, N. Y., has issued a number of sheets describing its precision torsion balances for weighing lamp filaments and its various types of meters and circuit breakers.

Pelton Water Wheel Company, San Francisco, Cal., has issued a folder describing the individual features of the exhibit of hydraulic power apparatus and auxiliary equipment at the Panama-Pacific Exposition, San Francisco, Cal.

Standard Underground Cable Company, Pittsburgh, Pa., has issued a booklet entitled "Pointers on Telephone Cable Specifications." The booklet contains useful information regarding the size of conductor and sheath and type of sheath for various conditions, and directions for preparing specifications.

Pittsburgh High-Voltage Insulator Company, Pittsburgh, Pa., has issued a folder describing its high-voltage porcelain strain insulators of standard styles. These insulators are all free from metal parts and are not subject to strains set up by the use of metal expanding in greater proportion than the insulation.

Carnegie Steel Company, Pittsburgh, Pa., has issued the fifth edition of the Carnegie Shape Book. This book contains a complete list of all the products manufactured on the shape, plate, bar and rail mills of the Carnegie Steel Company with a few unimportant exceptions and is indicative of the variety of forms now made in rolled steel. A comparison of this edition with the fourth, issued in 1911, will show roughly the progress of the introduction of steel in varied lines within the past four years. Among the relatively new lines of manufacture will be noted very many new sash and casement sections, used in the construction of metal window panes, skylights, etc., and a large number of automobile sections together with a line of light weight beam sections distinguished from the American standard sections by the designation structural beams. The book is printed on special lightweight thin paper adopted by this company for publications of this kind and is attractively bound in green leather with gilt edges. Copies may be procured at the price of \$1.

The Port Commission of Seattle, Wash., and the Ferry Line Auto Bus Company are negotiating for the establishment of jitney bus service in West Seattle in connection with the bay ferry steamers. The plans as proposed call for the operation of three large jitney buses. The agreement provides for a fare of 5 cents from Seattle across the bay to West Seattle by ferry, and by jitney bus to nearly every part of West Seattle, 2 cents of the fare to go to the Port Commission and 3 cents to the jitney bus company. The proposed buses would compete with the Alki Point and Fauntleroy lines of the Puget Sound Traction, Light & Power Company in West Seattle.

Vol. XLVI

NEW YORK, SATURDAY AUGUST 7, 1915

No. 6

GUARDING ADMISSION TO OPERATING DEPARTMENT The second article of Dr. H. E. Fisher on the medical methods of the Elevated Railroads of Chicago, published elsewhere in this issue, presents a strong and vividly illustrated argument for the thorough physical examination and rigid method of selection of trainmen. Although the importance of accepting for railway operating service only those who are physically fit is generally recognized in theory, this principle has not always been carried out in practice owing to the lax methods employed in examining applicants for physical defects which are not at first apparent. It is pure folly, from a financial standpoint, for any railway company to entertain the possibility, through slipshod physical examinations, of risking the lives and safety of its patrons in the hands of motormen afflicted with heart trouble or any other ailment liable to produce sudden disablement. Rejection may be a hard blow to the motorman who has previously served without mishap on another road which was less particular, but his former experience cannot counteract the unfairness of the latent danger to the public and loss to the company. The operating department cannot be treated like an old clothes basket but should avail itself of the services of an experienced medical man who is not so overburdened with other work that he cannot render conscientious examinations. We understand that Dr. Fisher's first article, which appeared in our issue of June 26, attracted wide attention from operating and medical men connected with electric railway systems. The one this week should be equally instructive.

TRACK CONSTRUCTION AND WORKMANSHIP

Essential to permanent track construction in which extreme care has been exercised in the choice of materials and design is skilled workmanship. Frequently this important element is neglected to minimize first cost, but greatly to the disadvantage of the life of any installation. Slighted workmanship, like the use of inferior materials, must be paid for by increased maintenance costs. Perhaps the pavement, which is a burden the track must bear although it is of no value in the operation of a street railway, is the most typical example of slighted workmanship. As a rule, in pavements which are laid by railway companies, extraordinary care is exercised in the selection of the materials to be used and in the strictness with which concerns furnishing materials are required to adhere to dimensions and finish. After extreme diligence has been exercised in this respect, however, many companies conclude that nothing further is necessary to secure first-

quality results. Often labor of the cheapest and most unskilled kind is employed to lay the pavement. While the choice of materials and strict adherence to dimensions will, to a certain extent, affect the workmanship obtained from inferior labor, it will not produce the results that skill will obtain with the same material. A wide variation in the life of various types of pavement, not particularly as regards wear but as regards maintenance, is found on different properties. Undoubtedly this result may largely be attributed to the character of workmanship in laying the pavement rather than to the choice of materials and design. Common labor without experience should not be expected to produce a first-quality pavement, and neither should ordinary laborers who become skillful pavers be expected to become permanent employees at minimum day wages.

THE COST OF PEAK-LOAD POWER

A reference was made in an editorial in the issue of July 31 to generated energy that cost more than 50 cents per kilowatt-hour, and although this applied to a combined lighting and railway load subject to extreme seasonal variations as well as to high interest charges on distribution equipment, the extraordinary cost is well worth consideration in connection with properties operating only electric railways. Of course, such a figure is hardly possible in plain railway service, but it is a fact that even under normal conditions the generally accepted value of 0.8 cent per kilowatt-hour is wholly inadequate to express the cost of some of the energy that is consumed. Consider, for example, the daily peaks of a railway load in which the load line is of the same general form day after day. Upon the basis of the charges that are common for purchased power, these being probably as low or lower than those that would be involved if the railway generated its own power, and with a peak measured arbitrarily by averaging maximum morning and evening hours, all of the energy consumed in excess of the average demand of the adjoining hours would cost at least 2 cents per kilowatt-hour. If the afternoon peaks exceeded the morning peaks, one-half of the excess would cost 3.7 cents per kilowatt-hour, these costs being based on the customary rates of \$1 per month per kilowatt of demand, plus 0.4 cent per kilowatt-hour for energy actually consumed. It is through the seasonal variations, however, that power costs reach a real maximum, as the peak for one winter month will usually exceed those of adjoining months by several per cent. Under this condition the excess energy consumed during the daily peaks of the high month (even assuming inappreciable

variations from day to day and between night and morning) will cost some 25 cents per kilowatt-hour. The one thing, in fact, that saves the situation is that the energy which thus has to be supplied at high cost constitutes only a small proportion of the whole.

SPECULATION BY DIRECTORS

The New York Times *Annalist* in recent issues has been publishing an unsigned symposium of ideas in regard to the duties of directors in relation to buying and selling shares of stock of their own corporations. We were interested to find that although each of the men consulted had a fairly well-defined opinion regarding the proper practices in such a case, none came out with a ringing statement of a clear-cut standard of conduct to govern market transactions by directors. Each man expressed his personal opinion—some favored unlimited buying but condemned short selling, and others upheld all acts not known to be injurious to other stockholders. Almost all, however, seemed to be struggling in an apologetic manner with a subject about which little has been said publicly by corporate leaders and for which none desired to be the first to define the limits demanded by sound ethics. It seems to us that where so few positive statements are available and where none desires to sign his name in defense of acts that he thinks might be condemned, there is an opportunity for missionary work of a clear-speaking sort.

Two examples occur to us of the laudable in directorate affairs. In the above-mentioned review President Shaughnessy of the Canadian Pacific Railway was not loath to state emphatically under his own name that from the beginning of his company it was understood that no director should speculate in the stock market or take advantage of any information secured in advance of other stockholders by virtue of his membership on the board. No qualifications can be found in this platform. The second incident which we have in mind is the recent resignation of William B. Hibbs from his directorship of the Washington Railway & Electric Company and other public utility corporations. As a broker Mr. Hibbs was called upon to buy and sell securities of the several companies of which he was director, thus being placed in an embarrassing position and sometimes subject to criticism. His withdrawal is not proof that he could not maintain a rigid separation of his functions as broker and director but rather a praiseworthy recognition of the broad ethical precepts making the maintenance of such a position inadvisable.

The vital point underlying these examples—and a point also which the quoted directors in the *Annalist* by their very anonymity seemed to emphasize—is that there is in existence, though not entirely crystallized, a sound public opinion against the propriety of speculation or even the appearance of possible speculation by directors. Little hesitation would be shown by the public in condemning directors who used their office for personal aggrandizement to the detriment of other stockholders. For this reason publicity would be an

acid test for all acts of directors. If every director were required by law to publish to the stockholders all his transactions in the corporation's securities, so that it might be known whether he profited by prior sales or otherwise while other owners lost, the temptation of speculation would, we think, be removed. While such a provision may never become law, we would advise directors to hold it up before themselves for their moral guidance. He who would recoil from such a public test would do well to set up ethical standards of a more certain propriety.

NEW TECHNICAL TERMS IN HEAVY ELECTRIC TRACTION

The coinage of new technical words and phrases and the addition of new meanings to existing electrical terms are going on at a tremendous rate, for every new development brings with it an array of new equipment and operations which must be discussed. The new terms are likely to be suggested hastily, but so urgent is the need for them that the first proposal may easily find its way into popularity, and usage fixes it for a time. Take, for example, that flexible and ubiquitous word "jitney." Of uncertain origin it appeared in the West as synonymous with nickel. Next it becomes an adjective largely appropriated by a certain, or rather uncertain, type of motor car, then by buses of more pretentious size. Next it becomes a noun again, meaning a certain type of vehicle. What it will mean next, nobody knows.

Another word is pantograph, which is occasionally spelled "pantagraph," although the former spelling is preferred by both the Century and Webster's dictionaries. This word comes from two Greek words meaning "all" and "write," and is the name of a very old instrument for the mechanical copying of engravings, diagrams, plans, etc., either upon the same scale or upon a reduced or enlarged scale. With this meaning it occurs in a number of languages in substantially its English form. Recently the word has been applied to a collapsible frame used in collecting current for certain types of electric cars and locomotives, the form of which suggested the form of the drawing instrument, although the significance of the name is lost. This is said, not to criticise the new use of the word, for the word may be as good as any for the purpose, but to point out the trifling nature of the origin of a new meaning for an established word. This is the way of all but dead languages, and we must reckon with it.

At the recent A. I. E. E. convention, C. J. Hixson discussed, among other subjects, the need for careful definition of terms used and needed in connection with electric railway contact systems. In general we agree with his suggestions, but not when he states that "common usage seems to have already classified trolley wire collectors into wheel trolleys, roller trolleys and slider trolleys." Now with all respect to common usage, whose absolute sway in the formation of language the ELECTRIC RAILWAY JOURNAL respectfully owns, it seems that the A. I. E. E., which presumably has considerable in-

fluence with common usage in its field, ought to remonstrate before it is too late. "Slider trolley" breaks loose from all convention and ignores the history as well as the later uses of the word "trolley." Trolley was originally a costermonger's cart, then a small truck or car for running on tracks in a rolling mill, then a little truck for collecting current from overhead wires, finally specializing, according to the Century dictionary, into "a metal roller or pulley arranged to travel over, upon, and in contact with an electric conductor suspended overhead and connected with a flexible conductor or trolley pole for conveying the current into the motor circuit on an electric car." The "Electric Railway Dictionary," published in 1911, also preserved the distinction between a revolving contact device for use by cars, like the trolley, and a sliding contact device, like the bow collector and the conduit plow.

We admit that engineering usage in the past has been somewhat loose in this matter, and we ourselves may not always have been consistent in the use of all of these terms. Nevertheless, it has always been the aim of this paper to exert its influence in the direction of exact and correct terminology, and it appreciates the rapidly increasing efforts which are being made by technical societies to conserve effort and prevent misunderstandings by means of careful definition. In the early stages of an art a certain amount of looseness of expression can be pardoned, but as methods and apparatus become more standardized it is the duty of all to unite upon a common nomenclature. It is to be hoped that the A. I. E. E. standards and railway committees will consider Mr. Hixson's suggestions and recommend such terms as will enable us to say exactly what we mean in a reasonable number of words.

THE BLUE HILL FARE DECISION

A consistent policy with respect to the encouragement of electric railway earnings is evidenced by the recent decision of the Massachusetts Public Service Commission in the Blue Hill Street Railway fare case, abstracted elsewhere in this issue. Recognition of the needs of struggling companies by the board was so well set forth in its notable Middlesex & Boston decision last fall (ELECTRIC RAILWAY JOURNAL, Nov. 7, 1914, page 1055) that the finding just announced in the Blue Hill case is the logical outcome of the former. In certain aspects, however, the Blue Hill case has unusual features, and the treatment of these by the commission is most illuminating.

The road is a small one, serving probably less than 20,000 local residents in the outer suburban territory lying around Mattapan Square, Boston, the Blue Hills, Milton, Canton and Stoughton. Its total trackage is about 20 miles, and the length of the main line only about 12 miles. Built by Stone & Webster fifteen years ago and ever since managed by these interests, the property has rendered valuable service to the public, but it has never been able to earn a dividend, despite the most careful operation. With a gross annual revenue of about \$93,000 the company meets its operating ex-

penses and bond interest but has been unable to make any consistent appropriation for depreciation. On pleasant Sundays in the summer it is almost overwhelmed with traffic, but at other times earnings are small, due to the low density of population, to the increasing use of automobiles and to steam railroad competition.

The company asked the commission for a fare increase which would yield an estimated additional revenue of about \$11,000 per year, the most important feature of the proposed tariff being the establishment of an 8-cent fare unit in place of the existing 6-cent rate. A short investigation was sufficient to demonstrate the company's need of additional revenue, but in carrying out its proper conception of responsibility to the public the commission made a very careful study of the finances of the road, setting forth its reasoning and deductions with as much care as though the system were twenty times as large. Instead of authorizing the use of an 8-cent fare unit, however, the commission added a fourth zone and thus made the fare from terminal to terminal 21 cents instead of the previous 18. The establishment of this zone enabled the board to standardize a 5-cent fare unit in three zones, retaining the 6-cent unit in the zone nearest Boston, which compensates for various inequalities in distance or traffic as outlined in the abstract. The establishment of two-part tickets for use at all hours between certain residential and industrial points on the southern part of the road was deemed preferable to the issuance of workingmen's tickets good only at night and morning. Such a differential fare arrangement is most interesting, and would seem to be highly appropriate under the conditions as a means of providing for short rides at relatively low cost to the passenger while affording the company the increased income essential to its service.

As in the Middlesex & Boston case, the board dismissed reproduction cost as the touchstone of value upon which to figure rates, adhering to the actual investment for this purpose, safeguarded as the public has been by the Massachusetts anti-stock-watering laws for many years. In this connection, the remarks of the commission upon accrued depreciation are well worth reading, for the board emphatically holds to the idea that the public should pay for the wear and tear upon the property, and for its deterioration in its service, no matter whether that depreciation is met early or late, by a road honestly and capably managed, and which has been unable to set aside funds for this important function by reason of its paucity of revenue. Another interesting point is the selection of a sum representing the principal upon which the return is to be earned on a total lower than the company has shown to be correct but which still demands a substantial increase in rates before the proper charges can be met. By taking a sum thus so much to the advantage of the remonstrants to the increase and clearly demonstrating the inadequacy of the existing rates, the board leaves no opening for disagreement among those opposed to the increase as to the justice of its finding.

Examining the Physique of Chicago Elevated Employees

The Author Treats of the Methods Employed for Determining Physical Fitness and Emphasizes the Importance to the Traveling Public of Thorough Physical Examination of Applicants and Employees

BY H. E. FISHER, M. D., SURGEON ELEVATED RAILROADS OF CHICAGO, ILL.

After the sight, hearing, color perception and mentality of an applicant or employee of the Elevated Railroads of Chicago have been examined he should pass a series of practical physical tests. To give a thorough examination, it is essential to have the applicant stripped, at least down to the waist line. This permits the examiner to have a better opportunity to obtain information which otherwise would be lost. It is not always practicable or feasible to strip a man, but it is important that he bare his chest and abdomen. In the examination of the heart and lungs it is necessary to get down to the skin surface to hear clearly the various chest sounds. It is folly and poor practice for a physician to try to examine a man's heart or lungs through a number of layers of heavy clothing. These deaden the chest sounds, and the delicate murmurs of the heart and the râles of the lungs are lost. The right and wrong ways to examine the heart and lungs are shown in the two accompanying illustrations.

I recently had the foregoing fact illustrated in the case of a man who had been examined and accepted for promotion to motorman on a high-speed interurban railroad. Later I had an opportunity to examine this man for a position as guard. With his chest bared, a dangerous organic heart lesion was found by using a stethoscope, much to the embarrassment of the applicant.

Failing to understand how a railroad examiner would pass such a dangerous risk for the hazardous work of a motorman, I questioned the applicant. He informed me that the doctor had made the heart examination with his ear and through the clothing, and I quickly understood how the heart lesion had been overlooked. That error in technique on the part of the medical examiner might have resulted in a serious accident in case the motorman had heart failure while driving his car. This applicant offered strenuous objection to baring his chest when I examined him because, no doubt, he was aware of his heart condition and knew that an examination with the chest exposed would result in his being refused employment.

EXAMINATION OF HEART

In the medical office of the Elevated Railroads of Chicago the applicant's or employee's heart is carefully examined with the latest instruments. The condition of the heart valves, presence or absence of heart lesions, character of the heart and pulse beats, position of the heart apex, whether normal or displaced, the relative size of the heart and any pathological changes in the heart as indicated by the various characteristic sounds are carefully recorded.

A rapid beating of the heart found at the time of

CHICAGO ELEVATED PHYSICAL EXAMINATION—IMPROPER METHOD OF EXAMINING HEART AND LUNGS

CHICAGO ELEVATED PHYSICAL EXAMINATION—PROPER METHOD OF EXAMINING HEART AND LUNGS

examination may often be attributed to some heart defect when, in fact, it is due to the nervous state of the applicant when the heart tests are made. It is always better practice to put off the heart tests until near the end of the examination. By that time the applicant's excitement has disappeared and the real status of the heart can be obtained.

Any heart lesion is good cause for rejection of an applicant. It is imperative that the heart be normal or nearly so to minimize the risk to the passengers. All motormen should have normal hearts to avoid the chance of their losing control of their trains due to a heart failure. Some may say strictness in this particular is unnecessary because the installation of the "dead man's control," which, if an accident occurs, will bring the train to a stop. Too much reliance for the protection of passengers and property, however, should not be placed in mechanical devices, because they sometimes fail at the critical moment.

In re-examination of old motormen a weak heart should receive careful consideration. Such a man is a dangerous risk to put in charge of the front end of a train. He should be relieved of his responsibility and be appointed to a less hazardous position where he can make a good living. Sentiment in this respect and willingness to take a chance that an old motorman's heart will not fail him open the way to a serious accident. It is far better to reduce one motorman with a defective heart than to allow him to continue work which may not only result in his own death but jeopardize the lives of the passengers on his train. Some medical examiners, upon finding a motorman's heart defective, believe it can be remedied and recommend a leave of absence to undergo treatment. When the motorman's heart has improved he is permitted to resume his former duties. To my way of thinking such practice courts disaster and should not be tolerated.

When an employee returns from sick leave on account of rheumatism, gout, contagious or infective diseases his heart should be examined before he is permitted to resume his duties. All employees who have been sick for more than one week are examined before they are allowed to return to work.

PULMONARY LESIONS AND RUPTURES

In the examination of the lungs the presence of pulmonary lesions, such as tuberculosis or chronic bronchitis, are sought. An applicant suffering from tuberculosis should be rejected and urged to secure medical advice and treatment. Those affected with this disease should not be permitted to serve the public, because they are a constant menace to the good health of others. Experience has shown that there is no better habitat for the tuberculosis germ to get in its deadly work than in a closed car, especially in the winter time. The danger of this disease to those afflicted with it is increased when they work where they are exposed to quick changes of temperature and humidity.

Recently the author was asked to allow an employee who had been under the care of a physician for tuberculosis to return to work as a guard. The employee's physician had advised that the outdoor life on the elevated railway would be of great benefit, and besides the employee needed money and it was necessary for him to return to work. Permission was granted to try the work for a short while, but the employee was obliged to give it up because his physical condition grew worse. This example is typical of all cases of this kind. Outdoor work on a street car in the Central States, where weather and temperature changes come in rapid succession, is not beneficial for those with tuberculosis, and they are always a menace to the public.

Continuing with the examination of an applicant, it is also important to ascertain whether a rupture is present. Tests for rupture are so easily performed and so quickly accomplished that there is no excuse for allowing this part of the examination to be slighted. Neglect in this particular has led to suits for damages for a rupture alleged to have been received in an accident after an employee had entered the service, when in fact the rupture was of long standing and should have been discovered before he was given employment. It is true that surgeons often can distinguish between a recent rupture and one of long standing, but this is not always reliable. It is far better practice to be on the safe side and examine each new man thoroughly before he is engaged.

In regard to the claims for damages for ruptures alleged to have been received while in the employ of a company, the author knows of three cases which are being tried at the present time in the courts. In two of these cases no examination was made at the time of giving employment, and in the other case the surgeon did not examine for rupture. Medical testimony, also, bears out the point that the ruptures were of long standing and not of recent origin, but this was insufficient to throw the cases out of court.

All shopmen, road department men, electrical men and ordinary laborers who are permanently engaged should receive a careful physical examination at the time they enter the service and at three-year intervals thereafter. This will furnish a record of their physical condition, and in case any employee meets with an accident, proof is at hand to determine whether the accident caused the injury, whether they were predisposed to such an injury, or that the defect was present when they were first employed by the company.

Employees in the electrical department, particularly linemen, should have practically normal hearts. Experience has demonstrated that a man with a weak or defective heart cannot stand an electrical shock so well as a man with a normal or strong heart. A shock which would not necessarily be fatal to a normal heart has in many cases been sufficient to cause the death of men with defective hearts.

PHYSICAL CHARACTERISTICS AND AGE

Trainmen, and in fact all employees in the transportation service, should be at least twenty-one years of age and at least 5 ft. 6 in. in height. The only exception to this age should be in the shops where apprentices are employed. In the train service a man of youthful appearance does not command respect. Passengers like an older man, and, moreover, the rowdies are more prone to start trouble when a boy is in charge of the train. Youths are not disposed to be careful of themselves and passengers and are inclined to take greater risks than their seniors. Some may contend that this is a debatable question and claim that young men often make better trainmen than old men. I am satisfied that this is not generally true, but of course there will be instances where boys were geniuses, born to be trainmen. The older men are conscientious in the discharge of their duties, because in most cases they have families dependent on them and they cannot afford to take risks which might jeopardize their position or their pay envelopes. Before the age of twenty-one years few men look upon life seriously, and the youthful trainmen often do not care whether they hold their jobs or not. Moreover, younger men of the class from which trainmen are selected are not always as steady workers as older men, and they change from one position to another.

Undersized men, while a valuable asset in other walks of life, are not desirable in the train service. Trainmen

of this class have difficulty in reaching the bell and register cords, and they are obliged to stand on the seats to open ventilators. In a crowded car the small men may occasionally find it impossible to see their signals, fares or streets over the heads of their passengers. On a crowded car platform the short conductor is often unable to see that passengers have safely alighted but takes a chance and gives a hasty bell signal which may cause an accident. Moreover, the small man is often imposed upon by those prone to make trouble, because trainmen of diminutive stature do not command the respect that trainmen of normal or large size do. Although the small man frequently has greater courage than the large man, the disadvantage to which he is put on account of his size more than counterbalances this advantage.

OTHER MATTERS TO CONSIDER

Tests of the various nervous reflexes should be made to ascertain the absence or presence of serious nervous diseases. It is useless to dwell on the subject of rail-

may necessitate the payment of damages. On the other hand, care in this respect might have obtained a record of an old fracture which really contributed to the break because the leg was not so strong as, without the previous fracture, it should have been.

INFECTIOUS OR CONTAGIOUS DISEASES

Personal appearance was discussed in my first article, published in the issue of the *ELECTRIC RAILWAY JOURNAL* for June 26. In this article it was also stated that men with infectious or contagious diseases should not be employed. This suggestion applies particularly to those afflicted with venereal or specific diseases, because they may be conveyed to passengers with transfers or money. Any man in the acute stages of a venereal or specific disease should be relieved from duty and advised to secure competent medical treatment. In the case of employing new men, should their examination show diseases of this nature, they should be disapproved. These conditions reduce the efficiency of the man and are often the cause of fainting fits or convulsions. Any man addicted to alcohol or drugs, especially when there

TRAIN SERVICE EXAMINATION

road employees who have perfect use of their limbs. No man should be taken into the train service who has lost a leg or an arm or who is crippled so that he cannot get about freely. Agility is the watchword of "safety first." Men who have lost a leg or an arm in the service should be given employment, possibly as flagmen at street crossings, providing, of course, that their sight and hearing are good. Flagmen whose duties include the operation of crossing gates should have unrestricted use of their legs and arms. Experience has demonstrated that accidents often occur at crossings guarded by crippled men and, in addition, the company may be held for negligence because its employee was not in good physical condition.

All applicants should be carefully examined for old fractures or broken limbs. Frequently a trivial accident will result in breaking an employee's arm or leg which

investigated to justify the employee and not deprive him of his usual means of livelihood unless there is ample reason for it.

FORMS USED

The form used by the Elevated Railroads of Chicago to record the physical examination is shown in one of the illustrations on page 218. This form is prepared in duplicate, one copy for the examiner and the other copy for the superintendent. The latter copy is filed with the employee's original application for employment.

The other form shown is a combined form used for all employees other than those in the train service. Reference to my previous article will show the standard requirements for physical examination. Where a company benefit association is in operation all employees and applicants should have a urine analysis, thorough examination being made to discover any constitutional and systemic diseases.

On the Elevated Railroads of Chicago all employees in all departments except the ticket agents and the clerical forces are examined. This practice furnishes a complete record of each employee's present and past medical history. Thorough and systematic examinations insure a better class of employees, greater efficiency and tend to reduce the number of accidents and injuries. Such a practice is therefore a protection to both the employees and the corporation, and should be the cardinal safety-first measure.

Bus Competition with London Tramways

At a recent meeting of the London County Council it was stated that motor bus competition existed on 100 miles of the Council's tramway routes. The number of bus-miles run annually over these routes was roughly estimated at 20,000,000, the cost being estimated at 16 cents per mile. The number of men employed by the buses was estimated to be 1500, while the additional number of men required on the tramways to carry the passengers now taken by the motor omnibuses over the routes in question would be only 460, the additional number of cars being 184. Attention was directed to the loss to the country of the services of more than 1000 men, whose labor was uselessly performed under the existing conditions.

CONDUCTORS AND CARS USED IN ROME

Women Conductors in Rome

The European war in which Italy is now engaged has made its draft, as in other countries, upon the able-bodied men in the country, and a large number of the men employed by the different tramway companies have enlisted under the colors and have gone to the front. Under these circumstances the tramways have turned to women as conductors, and the accompanying views show some of those employed on the Società Romana Tramways-Omnibus, which operates the tramways in the Eternal City.

As shown in the engravings, the women wear a neat uniform with badge and carry the usual pouch for holding the pad of fare receipts used by the European countries for the various lengths of ride paid for under the zone system of fares. According to the management of the Rome tramways the service of women conductors have been very satisfactory.

GROUP OF WOMEN CONDUCTORS AT ROME—CONDUCTOR IN UNIFORM

Economics of the Jitney Bus Movement*

Factors Contributing to Its Development, Regulation and Cost of Operation—Effect on Owner, Railway and Public—Possibilities at Higher Rate of Fare

BY F. W. DOOLITTLE, DIRECTOR BUREAU OF FARE RESEARCH

It was not until late in the summer of 1914 that jitney bus transportation was recognized as a type, and it is probably true that a very considerable impetus was given to this business by the extent of unemployment existing at that time. While no accurate and comprehensive figures are available showing the number of buses in service from time to time, a rather careful examination of such data as are available indicates that we may date the origin of the industry as of Sept. 1, 1914. Its extent increased very rapidly until Jan. 1, 1915, after which it fell off slightly, reaching the previous high point again on March 1. Since that time, with the advent of more favorable weather conditions and the increase in tourist travel, the number of buses in service has increased slightly. The maximum number in service at any time appears to have been about 6000. Various factors have contributed since the latter part of 1914 to the growth of the jitney business, and these will be enumerated and discussed more fully later. It is apparent, however, that unemployment in the skilled trades, the accumulation of a large stock of second-hand cars normally idle, wide advertising in the newspapers of this novel method of competition with street railways, and the appeal to a large number of people made by an opportunity to ride in a car, as is customary on the part of their more prosperous neighbors, are the principal reasons for the very rapid growth in the number of jitney buses in operation during the later months of 1914 and the early months of this year. At present, the total number of buses in operation in the cities where the development has been under way the longest is practically stationary where no regulation has been attempted, and where there is some form of control the number is somewhat less than it has been in the past. In this connection, however, it is of considerable import that while the number of vehicles has remained for some weeks practically stationary, the personnel of those interested in this industry has been changing at a rapid rate. In one instance, out of some thirty men meeting to organize a jitney owners' association none was present at a meeting of a similar number of men held a month later, although in the meantime the number of jitneys in operation had remained about the same.

What the influence on electric railways of this type of competition may be it is difficult to predict. The jitney bus competes for business with the street car, but it competes also to a considerable extent with the taxicab and the somewhat more common method of transportation—walking. However, in certain cities there has been, since the advent of the jitney, a marked decline in electric railway revenues, traceable no doubt in part to general industrial conditions, but probably more largely to jitney competition. In small towns where the traffic is light and the length of haul short, the advantage of the jitney bus is greater than in large cities, and it may be expected to offer more serious competition to the smaller electric railways. Figures for a recent month from three cities, comparable except for size, show that for populations of 400,000, 40,000 and 20,000 the decreases in passenger revenues were

respectively 15, 40 and 60 per cent. It is, of course, impossible to say how much of this loss was due to competition from jitney buses and how much to industrial depression, and the facts are given only for what they are worth. A somewhat detailed study of the situation, as will be shown later, indicates to the writer that this type of competition will not be permanent, because the jitney operators are exhausting their capital to make a wage which would not be attractive were industrial conditions better. The permanence of any industry, the returns from which are not sufficient to maintain the physical property as well as to pay operating expenses, is to be seriously questioned; and it is evident in some quarters that the continued existence of the jitney bus as a transportation factor has been due to the advent of the second or even third generation of investors in the industry following the exhaustion of the capital of their predecessors.

FACTORS AFFECTING THE DEVELOPMENT OF THE JITNEY BUS BUSINESS

Taking the matter up more in detail we will examine the factors which apparently were principally effective in promoting the development of the jitney business. From the standpoint of the owner and operator of the jitney bus, the most favorable factors have been as follows:

1. Small investment is necessary to engage in the business. The practice maintained by automobile salesmen of accepting in exchange for a new car an old one at a fair figure has been made possible by the point at which the price of the new car was fixed. These second-hand cars then, taken in exchange on new cars, have been available to purchasers at a very low figure and they have also been used in the jitney business by automobile dealers who hire operators to conduct the business on a salary or on a percentage basis.

2. The industrial conditions existing during the past year, particularly during the latter months, were such that a large number of skilled laborers found themselves out of employment. Frequently these men had accumulated a small amount of capital which they have invested in new low-priced cars or in second-hand cars. A very striking instance of this occurred in a New England city where, immediately following the closing of the mills, a large number of former employees entered the jitney business. It is altogether likely that a return to better industrial conditions would eliminate from the jitney bus business a large number of men who are now willing to accept a smaller wage than they are accustomed to, or who have found that the hazards of jitney operation are less to their taste than those of the employment for which they have been trained.

3. There frequently arise conditions under which an individual is willing to make certain sacrifices in order to obtain immediate returns on a prior investment. Such is no doubt the situation in the case of a considerable number of jitney owners. These men, during more prosperous times, acquired cars which they have not for some months felt they could properly afford. To these men the opportunity to obtain a quick return on this capital invested in an otherwise unproductive piece of equipment has proved strongly attractive. They

*Abstracted from an article in *The Journal of Political Economy*, Chicago, July, 1915.

have entered the field in spite of the fact that under the customary conditions of operation they will, before a great while, have so depreciated the car as to make its remaining value negligible.

In the foregoing we have considered individuals who could weigh the somewhat involved principles of depreciation and the accounting which should properly accompany wasting assets. There are, however, a large number of individuals to whom the future is a closed book, and these probably constitute a major portion of those who have attempted to carry passengers for various distances at a fixed charge of 5 cents. One of the unfortunate phases of this experiment in transportation is that it appears to be likely that a considerable number of those who have engaged in it have been deprived of their accrued capital through their failure to recognize the fact that profits are properly computed only after the integrity of the investment has been assured in addition to the payment of operating expenses.

4. There has been for many years no more popular subject for the newspapers of this country than the public utilities. Any institution which affects as vitally as does the average public utility, and to as wide an extent, the members of a community, carries with it a news value. As a result the competition offered to electric railways in many cities by the jitney buses has secured a publicity which the competitors of other industries could not have obtained. It is immaterial that many newspapers have conducted so-called campaigns against the public utilities in their communities, for whatever affects any considerable number of the people has perforce a place in the newspaper read by those people. An additional factor of publicity has accrued through the very obvious advertising that the jitneys have done for themselves by their movements throughout the communities in which they operate. A ride in an automobile for 5 cents has been until recently something to occasion comment, and the appearance on the streets of a city of a large number of these cars carrying their advertisements on their wind shields has brought this new industry to the attention of a very considerable part of all the people.

From the standpoint of the patron of the jitney bus, there have been three factors favorable to the rapid growth of the habit of their use:

1. The novelty of going to and from one's work in an automobile, riding, as some of the jitney operators have felicitously expressed it, "on rubber and on air," has no doubt influenced many to use this form of transportation. This factor is, however, one which will decrease as time goes on. Many industries have been built up and have thrived for a short period, particularly in the amusement field, on the principle that novelty is as salable as more substantial commodities.

2. For a large part of the population of our cities, in spite of the constantly decreasing cost of automobiles, their use as a customary means of transportation is rare. No doubt a strong influence in the development of the riding habit has been the personal satisfaction which has come to the patrons of the jitney bus through a feeling, more or less definitely conceived, that they are, by adopting this means of transportation, bridging for the time being the gulf between themselves and their more fortunate neighbors in the matter of automobile riding.

3. The jitney bus is able under an unregulated status to offer certain conveniences which cannot be furnished by street railways handling passengers in larger groups. In the first place, the jitney operator is free to run his car to the curb and in fact on to a side street as an accommodation to his patron. He can vary his route

at will, and there is a certain convenience resulting to passengers from this. It should of course not be overlooked that what is a convenience to one passenger may be an inconvenience to another, but with the small numbers ordinarily handled in an automobile the conflict of interest is not so certain nor extreme as is the case with the larger numbers handled in one group by electric railways.

Under the head of convenience may be mentioned the higher speeds of automobiles. This is due to three factors: the design of the automobile, its ability to detour, and the smaller number of stops necessary to receive and discharge a few passengers than many. The progress being made throughout the country in the adoption of the designated stop scheme by electric railways is tending to lessen the difference in running time of jitney buses and street cars.

The smoking privilege has very largely been curtailed on electric railway cars because only a minority of the passengers would be favored by its retention. In open automobiles smoking is presumably less offensive to those who do not indulge than it would be in a closed street car. Here, again, the possibility of conflict of interest is less in the case of the small groups riding together in automobiles than in the case of the larger number riding together in the street car. It should not be overlooked that at certain seasons of the year throughout the country, and for a major portion of the year in certain sections, considerably greater pleasure results from a ride in the open air than in a street car.

Some of the privileges and conveniences here enumerated are likely to be curtailed by regulation, but it is evident that there will always be at certain times and for certain individuals conditions which lead them to prefer the jitney bus as a means of transportation. On the other hand, while the factors here mentioned as favorable to the development of the jitney business, both from the standpoint of the owners and operators and from that of the patrons, have been developing, other factors have been exerting apparently a greater force toward the elimination of this means of urban transportation.

From the standpoint of the owner and operator these unfavorable factors may be classified as follows:

1. *Regulation.*—A rather interesting statement of the necessity for regulation indicating the point of view of a number of city governments is contained in the message of Mayor Rose of Los Angeles to the City Council, Dec. 23, 1914.¹ The statements there made are rather typical and their appeal to local interest accounts, in a measure, for the rapid growth of regulation.

The communities in which jitney buses have been most rapid in their growth have attempted to regulate them in a variety of ways. The principal features covered in the earlier ordinances have been followed in the later ones, and the most complete and carefully thought-out regulatory provisions have been based on a consideration of the following factors:

(a) *Responsibility:* To accomplish this there has been generally required of the jitney owner a bond for the protection of individuals who are injured through the carelessness or negligence of the driver.²

(b) *Safety:* This has been promoted by fixing the requirements for drivers in such a way as to eliminate those least fit to operate cars. In certain cities a special examination of drivers is required, and in most cities which have adopted regulatory measures a complete means of identification of drivers is required for the

¹See ELECTRIC RAILWAY JOURNAL for Jan. 2, 1915, page 76. [Eds.]

²In one of the Pacific Coast cities each of the three bonding companies there represented has, since the advent of the jitney bus, refused to issue indemnity insurance for such vehicles, and in another city, somewhat smaller, the rates for such policies have been increased from an annual fee of \$50 to one of \$250.

use of the police department. Jitney operators are, of course, subject to police regulations as to traffic rules.

(c) *Reliability*: It has been deemed necessary for the convenience of the public that routes and charges be fixed, and many ordinances contain provisions to this effect. The tendency, early observed in many cities, to use the jitney for immoral purposes has led to certain provisions being made with regard to the lighting of closed cars.

(d) There appears in most regulatory ordinances provision for the licensing of jitneys and fees of various amounts have been imposed. In general these fees have not been particularly large, although there is a growing tendency to require these carriers to contribute by the means of special taxes to the extra burdens imposed upon the police and street departments in the cities in which they operate. These burdens imposed by regulations have eliminated a considerable number of the less efficient and less desirable jitney operators from the field, some because of their unfitness to operate a car and others because the added financial burden made it impossible for them to pay current expenses.

2. *Community requirements*.—Closely related to regulation, although properly classified under a separate head, are the requirements which the communities have imposed upon the jitneys in the way of contribution to public funds. Many cities have taken this step having in mind the fact that the money collected for transportation by the street railways is assessed for general purposes, and any diversion of this transportation income from street railways will lessen the amount thus contributed unless the agency to which the payments are diverted has imposed upon it burdens similar to those imposed upon the street railways. In certain cities as high as 15 per cent of the money paid to street railways for transportation finds its way into the coffers of the city, and it is apparent that any considerable lessening of the street railway's income will constitute a serious decrease in funds accruing to the city from this source.³ An interesting phase of this matter is that of paving requirements. In the days of horse-drawn vehicles it was held that since this transportation agency in its use of the public streets for gain damaged the paving to a considerable extent, it should contribute to the funds necessary to lay and maintain paving by means of payments in the nature of a direct tax. Upon the change in motive power whereby the cable and later the electric motor replaced the horse, no corresponding change was made in the assessment against the railway for paving, so that at the present time street railways face the anomalous situation of being required to install and maintain a large amount of paving which they damage not at all, the tax being an inheritance from a time when they did contribute in some degree to the wearing out of pavement. Up to the present time no considerable progress has been made in the matter of assessing against the jitney buses an equitable share of the costs resulting from the wear of paving. It is evident, however, that in those communities in which the jitney has made serious inroads into the revenues of the electric railways the city treasury will shortly be under the necessity of obtaining from some other source funds for paving maintenance

which have previously been furnished by the railways. A similar situation exists in regard to street sweeping, sprinkling and removal of snow.

3. *Depreciation charges*.—As has been indicated previously, the wasting of capital through the depreciation of the automobile has not been given proper weight in many cases. As the second-hand cars, and to a less extent the new cars which have entered this field of transportation, reach a point at which they can no longer be operated, the necessity for considering depreciation is being brought more forcibly to the attention of the owners. Those who entered the business first are now rapidly being brought face to face with this necessity, and although many operators have not yet given due weight to this factor, it will have, as time goes on, an increasingly greater force in determining whether or not the jitney bus is to remain.

4. *Cost of operation*.—The chief factor tending to discourage owners and operators of jitney buses is the high cost of automobile operation. This is a subject which has been gone into with a considerable degree of care, and the results of the computations based on actual operating experience in a number of cities are such as to indicate that, neglecting for the moment the wasting of capital, the average jitney operator is unable to make a reasonable daily wage over and above his cost of operation.⁴

THE ECONOMIC STATUS OF THE JITNEY BUS

We will look now at the economic status of the automobile engaged upon the public highways as a common carrier. It appears that this amounts to a reappearance of a type of transportation which vanished with horse-drawn vehicles upon the introduction of electric transportation, and it will be worth while to consider from various standpoints whether or not under present circumstances this type of transportation can return to supersede the more systematic type furnished by electric railways. While there are at present, in various cities, associations of jitney operators, not much progress has been made in the realization of their common interest by those engaged in the industry. With such a realization there would tend to come combinations and the formation of companies to take over and control the present scattered businesses. Such a development would greatly increase the ease of regulation and the effectiveness of control, and would probably result in making the possession of a franchise a condition of operation. Such changes do not appear to be a matter of the immediate future.

Obviously, the jitney bus will continue to exist if it can render a certain service at a less cost than its major competitor, the electric railway, or if it can render a better service at the same cost. The word cost in the previous clauses must be assumed to include a proper contribution to state and municipal funds. In other words, the existence of a subsidized industry, which is what the jitneys will amount to if they are relieved of their proper share of the burdens of the community, may or may not depend upon the factors which will be analyzed in an attempt to determine whether or not under free competition the jitney business will be permanent.

The question of the success of this experiment in urban transportation depends primarily upon three factors: (1) Is it profitable for the owner and operator? (2) Is it able to furnish a service to, and supply the needs of, a considerable portion of the community at a price within the ability of its natural patrons? (3) Is it upon general grounds advantageous to the com-

³Detailed figures of such loss of revenue are given herewith:

Company	Estimated Annual Reduction in Gross Income Due to Jitneys	Loss in Taxes to State 5 1/4 Per Cent	Total Loss to Public 12 per cent
San Francisco	\$920,000	\$48,300	\$110,400
Los Angeles	730,000	38,300	87,600
Oakland	300,000	15,700	36,000
Sacramento	37,000	1,900	4,400
Miscellaneous (estimated)	513,000	26,900	61,500
Total probable	\$2,500,000	\$131,200	\$300,000

If the public is not to be the loser this sum must be paid in taxes by the jitneys.

⁴See special report on cost of jitney bus operation by bureau of fare research abstracted in ELECTRIC RAILWAY JOURNAL for March 27, 1915. Figures on the cost of jitney operation from the report are quoted in part by Mr. Doolittle. [Eps.]

munity? Obviously an industry might exist and secure, at a profit to itself and at a rate within the reach of a considerable number of people, business which it would be contrary to public policy to permit to exist. We have discussed somewhat at length in previous pages the question of the cost of operation. Assuming that the operator of the jitney bus bears his proper share of the expenses of the community as a whole and that he protects his investment, it becomes evident that there is only a relatively small part of the total transportation business in any community for which he can compete. Under these circumstances transportation by automobile at a 5-cent fare cannot supplant for the city as a whole the transportation furnished by the electric railways. The existence then of competition for what may best be termed "short-haul" business⁵ appears likely to place upon the electric railways a burden such that it will be necessary, if operation is to be continued and the property maintained, to charge higher rates to those patrons who receive greater service. In other words, if there are eliminated from the business of the electric railway the short-haul passengers, the handling of whom presumably shows a profit, the passengers who are at present carried a considerable distance and the handling of whom shows a loss must in the future pay more than they do at the present. It is not within the province of this article to undertake to say in detail how such a change in fares will be brought about nor what effect the adoption of a zone system of fares would have upon the community in general. However the matter might be adjusted, it is apparent that such a change in the rates of fare on electric railways could not be accomplished without some difficulty and perhaps some loss.

The whole matter of transportation is a vital factor in city building, and any situation tending to bring about a change in the system of charging for urban transportation should be given attention by those within whose province it is to give thought to the larger interests of the community as a whole. In addition to the bearing which jitney competition appears to have on the rate of fare for a distance of more than 1 or 2 miles, which includes, of course, a considerable portion of suburban traffic normally handled on urban cars at a single fare, it should be noted that the confusion resulting from the addition of a large number of small, independent transportation units to the present complex traffic in city streets is a matter of grave importance. Various computations would indicate that it would be not an unusual condition during certain periods of the day to have the average distance between automobiles, engaged in passenger transportation, 5 ft. or less, if these cars were to replace the electric cars now furnishing the same service. Such a situation would doubtless be considered intolerable. It may be urged that the jitney business is in its infancy and that improvements in design of these passenger-carrying vehicles will so reduce the cost of operation as to enable them to compete upon a broader basis for the business of the electric railways. That such improvements in the art are possible cannot be denied; and as there have been improvements tending to reduce costs in very many of the mechanical arts, it will be indeed peculiar if the costs computed in this article are not lowered at some time in the future. There will still remain, however, in all probability, some reluctance on the part of cities to give up a major portion of their streets to passenger-carrying vehicles for the rendering of such service as is now being rendered by the electric railway cars which use but a small part of the street.

⁵The Kansas City *Star* quotes W. H. Miller, jitney promoter, as saying: "We are trying to select the short, profitable hauls, not more than 2 miles or 2½ miles at most."

It is such cases as these which point out the need of scientific traffic surveys in every city. It is as important for city governments to know accurately the movements of population from hour to hour as it is for a street railway company to have this information, and it is apparent that this is a matter which will be given increasing attention in the future. The proper location of bridges and tunnels, both for pedestrians and for vehicular traffic, is a matter which cannot be determined except by an accurate knowledge of the hourly movements of the people in the community. That these change from time to time is well known to those who have considered the matter, and the future development of means of travel through the various parts of any city should be planned always in the light of the best obtainable information as to the habits of its people. The use of a car 14 ft. long to carry four passengers is an extravagance which few cities can afford when cars seating fifty people are but 50 ft. in length. It may be urged that experience in Europe has indicated that cheap transportation in small units by transient vehicles has a legitimate place in the transportation scheme of any community. It should be observed, however, that conditions abroad are somewhat different from conditions in this country. In general, workers in Europe live closer to their places of employment than they do in this country. It appears that the average mileage per ride is considerably less in those countries than it is in this. The zone system of fares is very generally employed on European electric railways, and a considerable part of the population other than the laboring classes considers it beneath its dignity to walk a distance which in this country the average citizen walks with ease and without a thought as to its effect upon his social status.

CONCLUSION

In conclusion it would appear that the jitney bus cannot continue long to carry passengers the distances which it is now attempting to carry them at a 5-cent fare. The jitney bus, however, can compete with the electric railway for short-haul business. Improvements in automobile design tending to lessen depreciation and operating costs will probably from time to time change the maximum length of ride for which the jitney can profitably compete with the electric railway. It does not appear likely, however, that, within the near future at least, automobile transportation can be furnished to communities as a whole as efficiently and as economically as a similar amount of transportation can be furnished by the electric railway. The certain result of the taking of the more profitable business from the electric railways is an increased fare for the balance of the business. Assuming that the jitney business is regulated to a sufficient extent to protect to a reasonable degree the safety of the passengers and to promote as far as may be the reliability and regularity of the service, the interest of the city has not as yet been completely cared for. Streets are dedicated to the use of the public, and they will in the long run be so administered as to provide the greatest good to the greatest number. On this basis we may look to see considerable attention given to the fact that passenger transportation by automobile is wasteful of space in the city streets.

Considering all these factors, it does not appear that this most interesting experiment in urban transportation will result in the displacement of the present means of transportation, although for the period during which this experiment is being carried on individual instances will doubtless appear where the jitney bus can be operated profitably and with due regard to the interests of the people as a whole. It may not be out of place

to suggest that a limited number of people would probably be glad to pay 10 cents or even 15 cents a ride for service of a somewhat higher character than it is possible for electric railways to furnish. The number of such people is not so large that furnishing them with transportation de luxe will seriously encumber the streets; and it appears at the present time probable that, as the individuals who have already engaged in the jitney business discover that their profits are less than were anticipated, a certain number of them will try the experiment of furnishing their service for a fare of 10 cents. Whether the operation of the "double jitney" would be a profitable business or not it is not easy to determine; but it is quite likely that there is some form of transportation of this general nature at a rate between that charged at present by taxicabs and the rate charged by electric railways at which automobile transportation will be a profitable venture. It appears quite certain, however, that at the present rate of fare the jitney bus experiment is doomed to failure.

British Managers Discuss Conditions

At Meeting of Tramways & Light Railways Association in London It Was Shown that British Tramways Have Been Seriously Affected by the War

At the seventh annual congress of the Tramways & Light Railways Association in London on July 15, J. W. Dugdale, general manager Oldham Corporation Tramways, discussed the influence of the war upon the street railways in Great Britain. He stated that the number of tramway employees who had given their services for the war had reached 18,057, approximately 30 per cent of the total. Every man who had gone to the front had been assured that his dependents would be looked after and that if he was spared his situation would be open when he came back. The cost of these grants amounted at the present time to \$7,500 per week for the London County Council, \$5,000 for Glasgow, \$2,500 for Liverpool, and \$6,500 for Manchester.

Owing to the shortage of labor the car service has been curtailed in many instances. Extensive experiments with women employees for platform work have been carried out, and in the near future these will undoubtedly extend to other departments. Wounded soldiers who have been discharged from the army are being engaged as guards and are being offered light employment in various capacities. Under the conditions it has become imperative for traffic employees, especially motormen, to work a great number of hours each week. In Oldham the hasty training of men to fill motormen's positions has been the cause of an increase of some \$100 per week in the charges for electric energy. In that city the unit charge for current is 3 cents per kilowatt-hour, and it is expected that this figure will be increased because of the increase in the price of coal.

In the repair shops, a great scarcity of skilled mechanics exists, owing to the drafts by private workshops that are engaged in manufacturing munitions of war. On the Liverpool Tramways, munitions work is being carried out very successfully in the workshops, but only the largest tramway systems could cope with such operations and at the same time keep pace with their own repairs which need daily attention. Tramways are now handicapped in obtaining quick deliveries of materials, such as carwheels, axles, tires, etc., this condition having been brought about by the makers' inability to execute orders promptly because of pressing government work. Advances in the prices of material have already taken place and there is no doubt that

tramways will be called upon to pay very inflated prices for material of every description. The copper market has already alarmingly increased.

Free riding facilities have been granted to soldiers in training by a large number of tramways, and other free riders include wounded soldiers going to and from hospitals, refugee children going to and from school, etc. This concession has cost the Oldham Tramways Committee as much as \$200 per week, and at the same time the tramway revenue has fallen very much below that of normal times in a majority of towns. Owing to anticipated air raids, railways have to be prepared to be shut down direct from the power house at any time.

In the discussion of this paper a member stated that he had been unable to purchase steel tires and other equipment even at a 50 per cent increase in price, but notwithstanding the existing high price of material it was doubtful whether the postponement of track repairs was a measure of economy. Other speakers laid emphasis upon the difficulty of retaining sufficient men in service to operate the lines, the extent of the war's influence being indicated by comment to the effect that tramway employees were, in general, desirous of wearing badges similar to those worn by munitions workers in view of their services to the community at large.

OTHER PAPERS

Another paper presented at the meeting was entitled "Glimpses Into the Obvious" by A. V. Mason, general manager South Metropolitan Electric Tramways & Lighting Company, in which a number of hints on operating problems were presented. The discussion brought out considerable support of the prepayment principle and some comment on the advantages of high schedule speed.

A paper entitled "Battery Vehicles as an Adjunct to Tramways" by W. H. L. Watson gave data which indicated the superiority of the Edison nickel-iron cell as opposed to batteries of the lead type, owing to its lower cost of maintenance. In the town of Morecambe, Lancashire, where the overhead system was regarded as a menace to the scenic surroundings, a scheme for installing storage-battery cars was considered, this involving a capital expenditure of \$90,000 for twelve fifty-six-passenger double-deck cars and the necessary depot complete with charging equipment. The running cost was guaranteed not to exceed 11 cents per car-mile, including charges against interest and depreciation on capital.

It was considered that the storage-battery omnibus would prove to be a popular method of building up routes prior to the extension of a full tramway service, and a number of such buses have been installed. In several cases these have shown reductions in operating costs of 4 cents per bus-mile in competition with gasoline-driven vehicles. In one city the power consumption per mile was found to vary between 1.63 kw.-hr. and 2.10 kw.-hr. per bus-mile and the maintenance charges had proved to be very slight. Even with such low average revenue as 12 cents per bus-mile the service covered the expenses.

In the discussion the advantages of the storage-battery bus were emphasized, but there were some adverse comments upon the high cost of the vehicle. The hill-climbing qualities were praised, it being stated that on a certain severe hill the gasoline buses were unable to stop because they could not start again, but that the storage-battery buses had no difficulty in this regard. Storage-battery service wagons were mentioned favorably, a case being cited where an Edison battery vehicle did as much work for \$4.50 as could be done by horses for \$8.40.

London & South-Western Railway Suburban Electrification

At This Time 140 Miles Are Being Electrified—The Train Make-up and Equipment of the 600-Volt Cars Are Briefly Described

The London suburban lines of the London & South-Western Railway now being electrified, following a slight delay at the commencement of the war, are the circular route from Waterloo via Wimbledon, Kingston, Twickenham and Richmond and back to Waterloo, the Hounslow loop line and the Hampton Court, Claygate and Shepperton branches. The total length of these routes is about 47 miles, equivalent to about 140 miles of single track. At a later date a further system of about 50 miles of route, the equivalent of 100 miles of single track, may be undertaken. A map of the electrification was published in the *ELECTRIC RAILWAY JOURNAL* for May 3, 1913, page 799.

After an exhaustive study by the engineers of the London & South-Western Railway of all systems in commercial use, it was decided to adopt direct current with a pressure of 600 volts on the third-rail. The trains are equipped for multiple-unit operation, and for convenience in handling are made up of three-car units (eighty-four in all), consisting of two motor cars with a trailer car close-coupled between them. The individual three-car units are designed to be permanently coupled, to form convenient units for traffic. It is intended to operate these units as either three-car trains or six-car trains, this being dependent upon the traffic requirements.

Each three-car unit is equipped with four Westinghouse 275-hp motors, 590 r.p.m., geared 21:59 on standard 42½-in. driving wheels; these motors are arranged in pairs on the trucks underneath the cabs at opposite ends of the unit. All electric-control gear is placed in the cabs, each pair of motors being controlled from its own set of control gear. The installation of the control apparatus in the motorman's cab, following the plan of the London tube lines, was selected by the railway's engineers in preference to under-car location in order to permit greater ease of access for inspection, cleaning and adjustment. Access to the control apparatus is obtained on one side from the motorman's cab and on the other through large hinged doors in the partition between the motorman's cab and baggage compartments.

LONDON & SOUTH-WESTERN ELECTRIFICATION—END-ON VIEW OF MOTOR CAR

A further advantage in placing the control apparatus in the motorman's cab is that the weight of this apparatus comes over the driving truck and so increases the weight available for traction. For the electric trains the original rolling stock, consisting of the usual compartment coaches with side doors, has been used, the necessary alterations being made to fit them for electric service.

The motors are of box type with commutating poles and with a fan on the armature for internal ventilation. The control is of the Westinghouse all-electric type with automatic acceleration and deadman's handle. The coaches are heated electrically.

The Westinghouse brake used on the electric trains employs cylinders 12 in. and 14 in. in diameter with triple valves arranged to give almost simultaneous application of the brakes on a train 600 ft. long. All compressors start and stop simultaneously according to the maker's governor synchronizing system.

Another Massachusetts Fare Increase

Public Service Commission Adds Another Fare Zone to Blue Hill Line Because It Believes Company Entitled to a Fair Return on All Capital Honestly and Prudently Invested without Deducting Accrued Depreciation

In a decision handed down on July 31 and covering forty-two typewritten pages, the Massachusetts Public Service Commission ordered the establishment of a new schedule of fares on the Blue Hill Street Railway, a company operated by the Stone & Webster Management Association of Boston, Mass. The case is the most interesting of its kind with which the board has had to deal since the Middlesex & Boston finding in 1914, and in reaching its conclusions the commission has been guided largely by the latter. The company appealed to the board for authority to increase its fare unit from 6 cents to 8 cents, and while the road is a small one, operating less than 20 miles of track, the financial policy of its managers and the operating history of the company have been considered at great length. The commission soon came to the conclusion that the road needed increased revenue but deemed it important to discuss its regulative policy in considerable detail. An abstract of the decision is given below.

OUTLINE OF PROCEEDINGS

On March 9, 1915, the company filed with the board notice of a proposed increase in passenger fares to take effect April 15, 1915. The company proposed to make the cash fare 8 cents for every ride within the limits of any fare zone; to sell tickets, each ticket the equivalent of one cash fare, at the rate of seven for 50 cents; and to sell special school tickets at the rate of ten for 40 cents to pupils entitled by law to half-fare transportation. The existing fare unit was 6 cents, none other than school tickets being sold, the price of the latter being ten for 25 cents. The company estimated that the proposed increase would add from \$8,000 to \$12,000 to its annual revenue. The total operating revenue for the year ending June 30, 1914, was \$95,224. A public hearing was held on April 14, 1915, and a petition was presented by 137 residents of the town of Canton asking the board, if it should allow an increase, to order the company to sell a workman's ticket at the rate of 5 cents, good only on working days, between 6 and 8 a. m. and 4 and 6 p. m.

HISTORY OF THE COMPANY

The Blue Hill Street Railway was organized in 1899. The main line runs from Mattapan Square, in the outskirts of Boston, through Milton and Canton to Stoughton, with a short branch from the vicinity of Canton station to the Norwood-Canton boundary, and a still

shorter branch from Blue Hill Avenue, Milton, to Readville Square, Hyde Park. The total trackage is 19.75 miles, of which 1.32 miles are on private right-of-way. At Mattapan Square there is a connection with the surface system of the Boston Elevated Railway, but a through service rendered some years ago has been discontinued. At other points there are connections with other companies and the road substantially parallels the New York, New Haven & Hartford Railroad. The population of the three principal towns served totals 21,145, a gain of 27.4 per cent in fifteen years. When the road was first built its ultimate extension to Providence, R. I., was contemplated.

In general, a regular half-hourly schedule is maintained on the main line and an hourly schedule on the Norwood branch. The Readville branch has for some years been operated only on pleasant Sundays in the summer season, and at present cannot be operated at all, owing to a local bridge situation. On Sundays and holidays in summer a much more frequent service is maintained on portions of the road to accommodate a large travel to and from the Blue Hill Reservation, one of the most notable areas within the Metropolitan Park system. The company is not always able to handle all of this class of traffic. The cars at present are of the single-truck, hand-brake type, designed for moderate speed and economy in operation. The road was originally equipped with double-truck, air-brake cars, but a fire in 1909 destroyed these and the present rolling stock was specially designed to meet the needs of low-cost service. No attempt is made to conduct a freight and express business, but \$3,445 was earned in 1914 from the sale of power to a connecting company. The company was organized by Stone & Webster.

Prior to the current finding there were three fare limits on the main line, viz.: Mattapan Square to Ponkapoag, 5.41 miles; Blue Hill to East Sharon, 6.25 miles, and Canton to Stoughton, 4.22 miles. These zones overlapped, the total distance from Mattapan to Stoughton being but 12.74 miles. The unit fare was 5 cents until 1908, when it was increased to 6 cents and upheld by the Massachusetts Railroad Commission (Fortieth Report, page 115).

SCALE OF MILES
0 1 2 3 4 5
MAP OF ROAD

EARNING POWER AND CAPITAL EXPENDITURES

The operating revenue of the road in its fifteen years of life to June 30, 1914, totals \$1,021,151, operating expenses being \$770,266 and miscellaneous income \$2,417. Deductions from income total \$277,697, leaving a shortage in net divisible income of \$24,406. The stockholders have never received any dividends, revenues have often been insufficient to meet fixed charges and at times have failed to cover operating expenses. The gross earnings for the year ending May 31, 1915, were \$93,126, or \$2,440 less than in 1914, and balance for reserves and dividends was \$2,352 less this year than last. The balance sheet of May 31, 1915, showed total assets of \$717,272 and a deficit of \$43,202, the cost of the railway being \$409,559, cost of equipment, \$137,162, and the cost of land, buildings, etc., \$113,251. All the stock and bonds were approved by the railroad commission.

The loans and notes payable account of the company totaled \$160,601 on May 31, 1915, or 64.2 per cent

of the outstanding funded debt. The investment per mile is \$33,483. The commission concludes that the cost of the road is somewhat high for its location and questions the advisability of construction upon a percentage basis. Investigation of capital expenditures was hampered by the loss of construction records in the carhouse fire of 1909. In the absence of such records, the board resolves doubts arising from this cause against the company. Some criticism is included as to the accounting methods of the company and its returns to the board.

DEPRECIATION

The total deficiency, as compared with an allowance of 20 per cent of gross revenue per annum for maintenance and depreciation, since 1905, is \$35,341. No fund has been accumulated to offset depreciation. With respect to accrued depreciation, the board says:

"The extent to which deduction should be made for accrued depreciation must, to some degree at least, be determined by the method employed in ascertaining the gross amount from which such deduction is to be made. Because a method of dealing with depreciation may be sound where such gross amount represents the cost of reproduction new, it by no means follows that the same rule can be rigidly applied where the gross amount represents honest and prudent investment. Under the reproduction cost theory, credit is given to the company for appreciation on items entering into the estimate of cost (and often for 'going concern value'), and it is entirely consistent with that theory to make a deduction to the extent of existing depreciation on other items. On the other hand, if a fair return is to be measured by the 'capital honestly and prudently invested,' and if no credit is allowed for appreciation of the property through an increase in land values or higher unit costs of material and labor, it would hardly seem just to deduct the full amount of the accrued depreciation under all the circumstances and without reference to the causes of the failure of the company to make due provision for it.

"The ruling of the commission in the Middlesex & Boston case was accompanied by the express stipulation 'that if there is mismanagement causing loss, such loss must be charged against the stockholders legally responsible for the mismanagement.' In other words, the company is held to the same standard of honesty and prudence in the management and maintenance as in the original acquisition of its properties. It must, so far at least as it reasonably can, keep its investment good. If through some fault of its own it has failed to make due provision for depreciation, it cannot reasonably expect the public to pay a return upon that portion of the investment which it has neglected to preserve. But under a consistent application of the investment theory it would seem in general that deduction should be made for the depreciation which comes of age and use in so far only as the failure to make provision for it is due to the payment of unwarranted dividends or is otherwise attributable to mismanagement.

"In this case the stockholders have received no dividends whatever. In view of the low earnings, the character of the territory in which the company operates and its past and present efforts to increase its revenues, and after careful consideration of its history, the commission is of the opinion that the failure to make provision for depreciation and the virtual loss of invested capital caused thereby cannot justly be ascribed to mismanagement. To sum the matter up, the property has depreciated in value in the public service, and the stockholders have had no dividends. On the other hand, the public served has been receiving transportation at less than real cost, and has, in effect, used up a portion of

the property without giving an equivalent in return. As stated in the Middlesex & Boston case, to hold under these circumstances that the accrued depreciation should be deducted would amount to saying that money lost during the earlier stages of a public service enterprise is irretrievably lost by the stockholders; that if per chance rates have been fixed so low that the rate-payer has for a period of years obtained a service at less than cost this is the permanent misfortune of the stockholders, and that the public should never at any time and under any circumstances be called upon to make up a deficit thus incurred."

The board therefore rules that in determining the revenues to which the company is fairly entitled, allowance should be made for an amount equal to a fair return upon all the capital honestly and permanently invested without deducting accrued depreciation. The board does not hold, however, that if the company earns the amount to which it is entitled, it can properly pay dividends before the depreciation and other deficits from past operation have been made good.

The commission holds that if property of a company is destroyed by fire or other similar catastrophe before it reaches the end of its usefulness, or if it is voluntarily sold and a loss results over and above accrued depreciation, the amount of this loss should be deducted in determining the basis of a fair return. Such losses are risks which the stockholders assume and for which the company must be held responsible. The loss on the property destroyed by the fire was in this case inconsiderable, but the loss on cars sold over and above accrued depreciation came to fully \$11,000. The entire amount received from insurance, salvage and sale was not reinvested in permanent property. To the extent of \$21,327 it was used in reconstructing roadbed and track, an expense properly chargeable to operation. Funds so used can no longer be regarded as part of the capital investment, whatever bearing they may have in determining the reasonable charges against operation.

To all intents and purposes the Readville branch line has been virtually discontinued of late years. In view of the economic value, in general, to the State of even street railway lines whose existence seems hardly justified from the traffic point of view, the commission is not disposed to deny a return upon investment on the ground that an extension was built contrary to reasonable prudence and sound business judgment, except in the clearest cases. The line in question, however, seems on the evidence to be of so little economic value to anybody that the board would hesitate to approve an increase of rates upon the other lines merely to enable the company to earn a return upon the \$25,000 investment in this branch.

NEED FOR ADDITIONAL EARNINGS

The commission finds that a fair return should be based upon at least \$500,000, an assumption which it admits is distinctly unfair to the company but which leads to the irresistible conclusion that the fare-paying public has been and now is receiving service at substantially less than cost. Owing to the uncertainty of the records, the actual amount above this is left open without prejudice for consideration in any future proceedings. This sum is represented by \$300,000 outstanding stock and \$200,000 in outstanding mortgage bonds. Assuming no interest payments except upon the bond issue and eliminating the floating debt from consideration, the net earnings over and above operating expenses and fixed charges would yield but 4.61 per cent on the stock in 1915, with no provision for depreciation.

The board holds that the \$21,237 of capital funds used for reconstruction in 1909 should be treated as

an operating deficit, since the reconstruction was necessary, and if the company had not used available capital funds for this purpose it would have had to borrow money and to pay interest upon the debt. The company is entitled to have the sum gradually liquidated from earnings and to receive interest upon it to the extent that it remains unliquidated. Again, a sum of \$13,750 representing discount on bonds is likewise entitled to be amortized from earnings during the life of the bonds and to bear interest to the unamortized extent. The deficiency was supplied by floating indebtedness, and the company is fairly entitled to interest upon this indebtedness until the impairment of capital so caused has been made good from earnings.

The commission has little fault to find with the management of the company and sees no reason to believe that operating expenses can be reduced materially, if at all.

ADDITIONAL FARE ZONE

With the proposed increase to an 8-cent fare unit the increase, according to the company's estimate, would add about \$10,000 to the gross receipts, but Vice-President A. Stuart Pratt held in the hearing that the effect of such a fare unit would be problematical and that only a trial would determine its efficacy. Mr. Pratt said that an increase of about 10 per cent or 12 per cent is the estimated result of raising the fare unit from 5 cents to 6 cents on the Blue Hill and Brockton & Plymouth roads, both under Stone & Webster management. Assuming that the proposed increase would produce as much as \$12,000 additional revenue, there is no ground for a claim that this would result in excessive and unreasonable profits to the company. "If this were the only test to apply," says the board, "the commission would without hesitation approve the new schedule as filed." But with such a unit fare, the board holds that the discrimination between the long-haul and the short-haul rider would be unduly accentuated. Instead, it recommends the addition of another zone which was an alternative plan proposed by the company. Under this plan the unit fare will be reduced from 6 cents to 5 cents except in the zone between Mattapan and Blue Hill, which is much longer than any of the others, where it will remain 6 cents. The zones will have overlaps, and at one point, between Stoughton and Canton station, 4.22 miles apart, owing to local conditions, the company will sell two-part tickets, good at any time, at the rate of eight for 50 cents, the first part of the ticket to be collected in one zone and the second part in the other. It is estimated that these changes will yield between \$10,000 and \$12,000 additional annual revenue to the company.

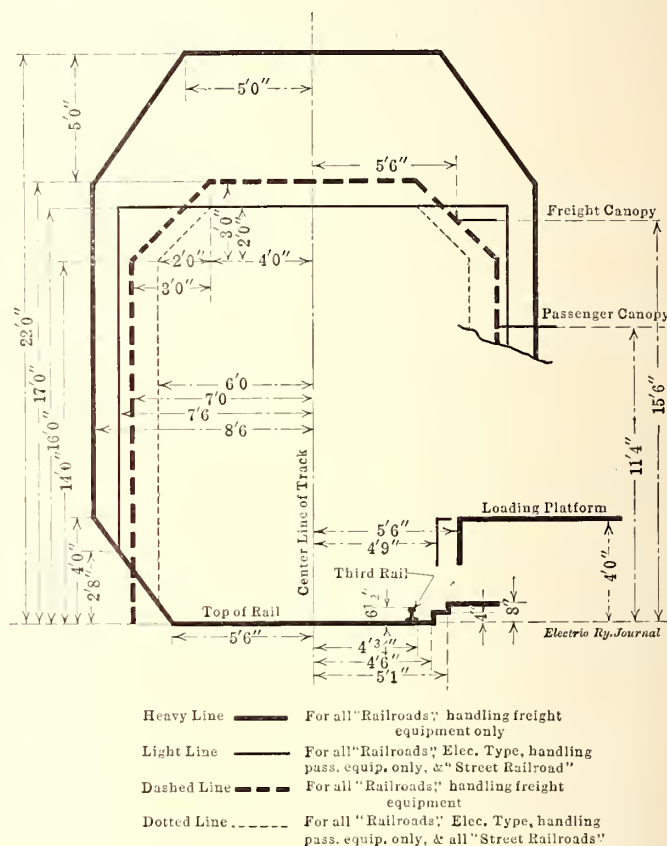

The board recommends a year's trial of the new schedule and orders that the rates take effect in thirty days.

Commission Fixes Railway Clearances

The Public Utilities Commission of Illinois, after investigating the subject of clearances on steam, electric and street railways, has prescribed minimum dimensions to govern future construction. The order states that hereafter any structure erected adjacent to any railroad or street railroad must conform strictly to the minimum clearance dimensions unless permission shall have been received from the commission to vary from them. The composite clearance diagram is shown in the accompanying illustration. In this diagram the solid lines show the clearances required between stations, the dotted lines the clearances within stations and in yards and terminals.

Clearances required which could not be shown in the

diagram for electric railroads are as follows: Those roads not handling freight equipment but which may be governed by a 9-ft. passenger car width are not permitted to have track centers less than 12 ft. Switching leads which lie adjacent and parallel to another track in which the switches are not operated mechanically, must have a center to center of track distance of 16 ft. For two switching leads parallel, this distance must not be less than 19 ft. The distance between centers for tracks given up wholly to passenger service in a passenger terminal or coach yard is prescribed as 12 ft. This minimum distance center to center of track also applies to track given up to loading and unloading of freight from

MINIMUM CLEARANCE DIAGRAM FOR FUTURE STEAM AND ELECTRIC RAILWAY CONSTRUCTION IN ILLINOIS

cars of a passenger or express type, at freight houses, private industries, steam tracks and similar places. It will be noted in the composite diagram that in addition to loading platforms, canopies and overhead side clearances, a third-rail clearance is indicated.

For street railways an 11-ft. minimum track center is allowed. The distance between the centers of switching leads and parallel tracks must provide a 3-ft. clearance between the sides of the cars. In city streets, where the clearance between main tracks is less than 3 ft. between the sides of the cars, the ruling provides that the windows of all cars shall be equipped with bars and that the vestibule doors shall be kept closed while the cars are in motion.

The clearance dimensions as prescribed in the composite diagram relate only to tracks on tangents or on slight curves. When the curvature is in excess of 6 deg., the rule provides that the horizontal clearance shall be sufficiently increased to secure the minimum allowance provided under the rules.

The Orleans-Kenner Electric Railway

This Is a New 1200-Volt Direct-Current Interurban Line in Louisiana

The Orleans-Kenner Electric Railway, popularly known as the "O.K." line, was placed in operation on March 7. The cars are operated from Canal and Rampart Streets, New Orleans, over 4.3 miles of the New Orleans Railway & Light Company's tracks, thence for 11½ miles on right-of-way through the communities of Southport, Shrewsbury and Harrahan City. This right-of-way is a continuation of the neutral ground or parked center strip, common to many New Orleans car traction streets. It is flanked by high-class shell roads. By the completion of an overhead track crossing by the Illinois Central Railroad the road has just been finished to Kenner, and its eventual extension to Baton Rouge, 115 miles further, is contemplated.

The 2-mile zone adjoining New Orleans is good dairy land, while the territory beyond is used for truck farming. The Orleans-Kenner Electric Railway will endeavor to build up these industries by a frequent express freight service. At present the principal transportation means of this district is by a gas-electric car operated over the main line tracks of the Illinois Central Railroad between Kenner and New Orleans.

INTERIOR OF CAR OF ORLEANS-KENNER RAILWAY

The rail is 70-lb. plain girder on creosoted pine ties laid 2 ft. centers. The overhead construction is a General Electric catenary with ½-in. sherardized messenger, ⅝-in. sherardized hangers spaced 20 ft. to 40 ft. apart, and No. 0000 grooved copper trolley. This construction is carried in spans of 125 ft. from creosoted pine poles.

Energy is purchased from the New Orleans Railway & Light Company and transmitted to the Harrahan City substation at 6600 volts, three phase, sixty cycles. It is stepped down to 600 volts by means of three Westinghouse oil-cooled transformers for delivery to the same maker's 400-kw rotary which comprises two 600-volt machines permanently in series.

The carhouse, like the substation, is also a brick structure. It has but one track, and this is equipped with a pit for repair and inspection. Cars will be stored either in the open with tarpaulin sheeting or under an umbrella shed, these practices being feasible because of the mild climate. The carhouse is also at Harrahan City. Pending arrival of the first four motor cars, operation was begun with cars leased from the New Orleans Railway & Light Company. These cars are operated out of New Orleans every hour.

The new cars are of combination passenger and freight express type and were furnished by the American Car Works of The J. G. Brill Company. The operating equipment for each car includes four Westinghouse 50-hp motors with HL control and Westinghouse automatic air brakes. Following Southern practice, separate toilets are provided for white and colored passengers. The baggage compartment is available for smokers. An interior view is shown herewith. An article giving the general dimensions and other particulars of these cars was published on page 270 of the issue for Feb. 6, 1915.

Bay State Way Organization

Division of Duties of Way Department on One of the Largest Electric Railway Companies

According to the 1912 census report the Bay State Street Railway, Boston, Mass., operated more miles of trolley line than any other company in the country and was second only to the Pacific Electric Company of Los Angeles in miles of track. The recent consolidation in Chicago and possibly extensions of other systems elsewhere may have changed the relative positions of companies as regards length, but the Bay State organization remains one of the largest systems in the country. It serves the eastern portion of Massachusetts outside of Boston proper, the lines extending from Nashua, N. H., to Newport, R. I. There are now sixteen operating divisions and the organization of the maintenance of way department is unusually comprehensive.

The department is headed by an engineer of maintenance of way with headquarters at Boston. Under him as immediate assistants are three engineers and a chief clerk, the organization further requiring the services of one bridge superintendent, five inspectors, seven division roadmasters, twenty-one division foremen, twenty-one foremen, and ten acting foremen. During the busy months it is necessary to employ about thirty additional foremen to assist in supervising the extra men that are needed.

During the winter season all extra foremen are employed at the regular foreman's rate as trackmen, it being considered good business policy to retain trained men of this class. The company has had as many as eighty-two gangs working at the same time in Massachusetts, New Hampshire and Rhode Island. The company operates 941 miles of track. The force in winter varies from 220 to 1000 men, according to the weather, and in other months from 500 to 1500 men.

The engineer of maintenance of way has general supervision and responsibility in connection with all work relative to engineering, construction, reconstruction and maintenance of track and bridges on the system. He personally takes up matters regarding locations, grades, rebuilding of bridges, street widening and highway matters with local and state authorities, including legislative committees and the Public Service, Metropolitan Park and Highway Commissions. He submits estimates to and receives instructions from the general manager regarding work to be done; makes a general inspection of all work in progress and gives personal instructions relative to the manner in which the work is to be handled.

One assistant engineer has personal charge of all office work in connection with the preparation of estimates, making surveys, preparing plans for location or relocation of track, designing of special work, and giving line and grade for track construction. He makes personal investigation and reports on track conditions whenever requested by the engineer of maintenance of

way, and attends public hearings and conferences when the latter cannot be present. In connection with this work are employed five assistant engineers in charge of survey parties, one draftsman, three instrument men and two rodmen.

Another assistant engineer has personal charge of engineering relative to bridges and structures supporting track. He is also in charge of engineering relative to the study of grade crossing abolition and checking up costs of construction as given in detailed statements by railroads in connection with the abolition of crossings. Special investigations of traffic conditions fall upon this engineer. In connection with this work one draftsman and one rodman are employed.

The third of the assistant engineers has personal charge of measurements and the preparation of detailed reports of new track work completed for the auditor. Under him come renewals of all track special work, the repair of all rail joints and general track maintenance and incidental engineering. There are employed in this connection two assistant engineers in charge of survey parties, two instrument men, one rodman and one draftsman.

The chief clerk has charge of the general office, including maintenance costs, checking of tools, railroad crossing, special work, construction, reconstruction and estimate records, material required and on hand, reports of work done, daily reports of maintenance and construction, the compilation of reports and correspondence. For this work are employed three stenographers and five clerks. The chief clerk also has charge of the division roadmasters' clerks.

The superintendent of bridges has personal charge of construction, reconstruction, maintenance and inspection of all bridges on the system, of which there are about 260. In this work are employed one bridge foreman, and from two to eight carpenters, depending upon the amount of work. This official also attends to special work, such as the maintenance and operation of stone crushers, temporary supports, and structures carrying track in connection with municipal and state improvements.

There are one tie and four track inspectors. The former has general charge of tie inspection of all ties ordered by the company and makes trips south as occasion demands, since some ties are inspected while in the course of loading. New men are broken in occasionally by the tie inspector when he needs assistance. He also attends to special work such as investigating foremen, timekeepers and outside clerks, and notes and acts upon reports submitted by inspectors.

The four track inspectors have similar duties in inspecting track, including construction and maintenance. One, however, pays particular attention to bonding and acts as division roadmaster in the concentration of work requiring the presence of the regular official of this class. Investigations of accidents, complaints, drainage and tool matters also fall within the jurisdiction of this inspector. Another inspector pays special attention to paving, another to electric drilling machines, electric welders, grinders and hydraulic rail benders, and another has charge of gravel pits during the busy season with the handling of work cars. Night work also comes under the supervision of the fourth track inspector.

Division roadmasters are personally responsible to the engineer of maintenance of way for track construction and maintenance in their respective divisions. Each of these officials has direct charge of from 75 to 229 miles of track. They receive and carry out instructions from the general office, personally inspect and call attention to large repairs required on their divisions,

make a weekly inspection of railroad crossings, new rail, special work, joints, etc. General correspondence, inspection and signing of payrolls fall within the scope of their duties. Under them are various division foremen, with a subordinate organization of oilers, blacksmiths and trackmen.

Instruction and Handling of Employees at Hampton, Va.

Besides Being Trained in the Operation of Cars, Motormen Are Instructed in Repairing Car Equipment and Inspecting for Defects

The following notes on the railway employees of the Newport News & Hampton Railway, Gas & Electric Company cover the practices in the instruction for motormen, in platform wages and in welfare work for all classes of employees.

INSTRUCTION OF MOTORMEN

A new motorman is broken in with a regular motorman until the instructor passes him on as fit. This period covers ten days to two weeks. Then the men spend four days in the shop pits and two days on the repair of controllers, compressors, etc. They receive \$1

INSTRUCTING EMPLOYEES AT HAMPTON—ACTUAL AND PAINTED CIRCUITS IN SCHOOLROOM

a day during this shop training. As a final polish the student is sent to the instruction room for several hours' teaching by the foreman electrician in cutting-out motors, inspecting for troubles, stopping cars with a single application of the air brakes, etc.

Although the company has no skeleton instruction car it has found a way to make learning attractive to future motormen by the use of illuminated circuit diagrams. In the instruction room itself are placed the control equipment for K-28 four-motor and K-11 two-motor operation, including circuit breaker and hood switch. Pictures of the circuits for each set of motors are painted on a wall of the room, while lamps are wired into the real circuit just below to show the relation between the resistance steps and motors.

The student is not placed in charge of a car until passed by the foreman electrician and master mechanic. Furthermore, the mechanical department has the privilege of calling for a motorman's return to the shop if it appears that he is abusing the equipment.

Motormen are also instructed in the duties of conductors, as all men must be prepared to operate at either end of the car. By this plan disturbance of service due to absence is reduced to a minimum.

WAGES

Platform men are paid as follows: First six months, 18 cents; second six months, 19 cents; second year, 20 cents; third year, 21 cents. Working time includes thirty-minute meal reliefs and deadhead running. Platform instructors receive 4 cents an hour extra.

Runs are divided into early straights, late straights and swings, as the cars are kept on the road from fifteen hours to twenty hours a day. The working time of the crews, including layovers, is kept within twelve hours. The tripper problem is a hard one inasmuch as the peak loads are only one and one-half hours long, both in the morning and evening. Nevertheless, the extra men are guaranteed \$1 a day minimum. At this time the company has thirty-three regular and nine extra motormen. The number of regular conductors is also thirty-three but the number of extra conductors is twenty because trailers are run during hours of heavy travel.

WELFARE WORK

All white employees who have served the company for five years receive a pass book for their wives while remaining in the service, aside from the monthly pass book issued to most of the other employees. Colored employees who have been in the service for five years receive annually three days' vacation with pay. As "lazy nigger" is such a stock expression, it is worth mention that most of these men prefer to work in vacation time and draw double pay. Colored employees, like a few of the white employees, ride on badges. The practice of giving premium uniforms every six months to all conductors and motormen who, during that period, have not been involved in an accident costing the company more than \$10, had proven highly satisfactory to all concerned.

The white employees of the company formed some fifteen years ago the Tidewater Relief Association. This body has always been managed directly by the men. The dues are sufficient to cover the relief work of the association, while the \$500 to \$600 donated annually by the company pays for four or five entertainments a year. These affairs take the form of oyster roasts and dances which are prolonged into the night to give every employee a chance to join in the merry-making. The association now numbers about 130 members. Among the chief clauses in its constitution and by-laws may be mentioned the following:

Membership ceases with resignation from the company's service; and the withdrawing member is entitled to receive the full amount of his contributions, less the pro rata share of disbursements made during his period of membership. A member who resigns from the association but not from the service does not participate in this privilege. The contrary was the case until it was discovered that some men resigned as members, got their pro rata and then rejoined a few months later! Under the present rules benefits do not begin until after four months' membership.

The death payment to the heir of a departed member is \$100, but if a member's wife or mother dies he receives \$50 to cover funeral charges and the like. The chief restrictions on the latter unusual provision are that no such benefit shall be paid twice to the same family within two years and that the relative so insured had been passed as in good health when the member himself was accepted.

Members who are not in receipt of regular salary while ill receive \$7 a week while totally incapacitated, \$1 per working day up to the end of the first six months and half that rate during the next six months, but not exceeding a total of \$200.

Sick payments begin for all non-salaried members from the beginning of the eighth day, assuming proper certification by the physician or presentation of other satisfactory evidence.

The management is vested in eight men, four of whom are car men, two from the mechanical department and two from any other department. This board of managers is elected annually. The managers receive no salary but are reimbursed for any time that they lose because of attendance at association meetings. The only official of the company regularly connected with the association is the auditor, who is custodian of the cash and securities. If awards are disputed they are open to arbitration by a board, the third member of which must be approved by the parties at issue. Dues are deducted from the member's earnings in advance.

Free medical attention is obtainable from any of four physicians, and to prevent malingering a man who reports sick is subject to visitation by fellow members.

The initiation fee is \$1 and the monthly payment is also \$1. This is more than customary elsewhere, but it should be considered that this association is really self-sustaining and that its disbursements include the unusual feature of death payments for wife or mother, as already noted. Assessments are limited to 25 cents a month.

On June 1 the company established a pension and insurance system, as described on page 1183 of the issue of this paper for June 19, 1915.

The clerical employees enjoy at half rates all privileges at the Newport News and Hampton branches of the Y. M. C. A., the company paying the other half. In this way the inside workers are encouraged to use as much of their spare time as possible for healthful exercise.

Among the most popular features of get-together work are the departmental tournaments at Buckroe Beach. These are held annually, and each member of the winning five-man team receives a \$5 sweater.

EMPLOYEES' SAFETY COMMITTEES

Another form of co-operation with the men is found in the committees on safety, economy and general efficiency. These are of two classes, those made up of groups of department heads and those of groups from the rank and file. The first committees are usually composed of three men, who are assigned to inspect a department over which they have no authority. Such committees make two inspections and reports a year. The employees' groups, known as sub-committees, are made up directly of workers in the department to be inspected. The sub-committees report monthly. New committees always have one holdover member to maintain the continuity of the work from year to year. All reports whatsoever covering this work are submitted for discussion at the weekly conferences of department heads under the chairmanship of the general manager. Action on the committee reports has resulted in many improvements, particularly in promoting safer working conditions and scientific care of new materials and scrap.

Among the suggestions adopted may be mentioned the following: Chains on flat cars in addition to couplings; employees' fire gangs; removal of unsightly and dangerous features like a defective rainspout outside the carhouse and rubbish-gathering shelves for holding fire pails inside the carhouse.

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Announcement Is Made of the Arrangements for Transportation from the New England Section—Convention Meeting Places—Engineering Association Committee on Standards Discusses Various Subjects

NEW ENGLAND TRANSPORTATION ARRANGEMENTS

For the greater convenience of New Englanders planning to attend the convention arrangements have been made for special-car service from Boston to the Coast and return in connection with the "Red Special" leaving for California on Thursday, Sept. 23. Henry E. Reynolds, assistant general manager Bay State Street Railway, 84 State Street, Boston, Mass., is now making reservations for this trip as chairman of the New England committee, and is prepared to give full information of this and the other special trains and to handle all details for members and other visitors to the convention from the northeast section of the country.

EXTERIOR OF NATIVE SONS' HALL, WHERE THE MEETINGS IN SAN FRANCISCO WILL BE HELD

By the original plan, New England delegates would have been obliged to join the "Red Special" at Albany, N. Y., in journeying by this train, but arrangements have now been made for the attachment of a number of cars of the seven-compartment, two-drawing-room type to the 10 a. m. express out of the Boston South Station on the Boston & Albany Railroad on Sept. 23, these cars to be attached to the "Red Special" at Albany and thence to continue across the continent and back to Boston as an integral part of the tour of this already celebrated train. The accommodations of the "Red Special" will include a baggage car with trunks acces-

sible at all times, a club car, two "diners," valet, maid, barber and stenographic service, piano, "Victrola," and ample observation car accommodations. The party will be entertained at Milwaukee, Wis., Spokane and Seattle, Wash., and Portland, Ore. Already about twenty persons have signified their intention of going to San Francisco from New England on this train. Upon the filling of an application blank tickets will be prepared and mailed to the signer by Mr. Reynolds about Sept. 1, and all New England electric railway men and their friends are cordially invited to make full use of these facilities either by wire, mail or in person.

CONVENTION MEETING PLACES

As stated last week, the meetings of the association in San Francisco will be held in the building of the Native Sons of the Golden West, which is located between Geary and Post Streets at 414 Mason Street, directly in the rear of the St. Francis Hotel. The appearance of the front of this building is shown in the accompanying engraving. This is the building in which the National Electric Light Association held its convention last June.

The building contains numerous rooms suitable for general and committee meetings. Of these the largest is the Native Sons' Hall, consisting of an auditorium 66 ft. x 82 ft. or about 5500 sq. ft. It has a stage at one end, and the estimated seating capacity is about 2000. There are lobbies and a small reception room near the entrance. The sessions of the American Association and of the Transportation & Traffic Association will be held in this hall, which is on the first floor of the building.

The other associations will meet in lodge rooms on the fourth floor of the same building. The room selected for the meetings of the Engineering Association is called "Yosemite Hall" and is about 31 ft. x 67 ft. "Sacramento Hall," where the Claims Association will meet, and "San Joaquin Hall" where the Accountants' Association will meet, are also on the fourth floor. These rooms are also commodious, being each 31 ft. x 48 ft. All are well lighted and provided with ante-rooms.

The secretary's office and registration headquarters will be in the lobby on the main floor of the building.

The Native Sons' Building is in the center of the hotel, theater and club district of San Francisco and is used for many meetings in San Francisco.

ENGINEERING ASSOCIATION COMMITTEE ON STANDARDS

As stated in last week's issue, page 188, a meeting of the committee on standards was held in New York on July 29 and 30. In addition to those whose names were listed as being in attendance, the following were present at the second day's sessions: E. R. Hill, E. B. Katté and J. M. Waldron, all of New York City. The purpose of the meeting was to pass upon the recommendations of the technical committees in so far as they affect association standards.

On Thursday, after roll-call, Secretary Burritt read in full the rules for the adoption of standards and recommendations. The committee then took up one by one the recommendations of the committees, giving most thorough attention to each.

Prof. A. S. Richey presented the power distribution committee report. The inclusion of specifications for concrete poles in the Engineering Manual, as information, was authorized, as were also certain improvements in the steel-pole tables and formulas. At the suggestion of this committee the printing in the manual of portions of the report of the joint committee on the joint use of poles was also approved. The power distribution committee presented an elaborate, illustrated set of specifications for 600-volt overhead line material, the printing of which was approved. Recommendations as to the location of lightning arrester grounds, involving changes in Sections 81 and 82 of the overhead line construction specifications, were adopted, these being in conformity with the report of the committee on lightning protection.

The committee on lightning protection made a number of recommendations as to details of arrester installation and appended appropriate technical data. These were approved for printing in abstract in the manual.

The committee on buildings and structures recommended approval of a set of rules for instruction to employees for fire protection, which have been before the association for several years. These had been referred to Mr. Schreiber for consideration with the National Fire Protection Association. They have now the approval of this association. These rules are already contained in the manual, Section Bm 2b. They were approved by the standards committee.

At the session on Friday Mr. Gove presented the report of the committee of equipment, bringing up first a revised specification for heat-treated carbon-steel axles, shafts, and similar parts. It was decided to supersede this with a new specification which differs mainly in being more definite in wording and more up to date, the title being changed to cover quenched-and-tempered carbon-steel axles, shafts, and similar forgings. The specification for annealed carbon-steel axles, shafts, and similar forgings was then approved for revision in certain sections dealing with physical and chemical properties. New specifications for gears and pinions were submitted, these including both the quenched-and-tempered and the case-hardened types, and these were approved by the standards committee for submission to the convention as recommended specifications.

The equipment committee's proposal to print in the Engineering Manual a schedule for proof testing heat-treated steel forgings was approved, as was also the printing of the N. F. P. A. rules. Approval was given to a revision of the specification for air-brake hose in which minor changes in detail were proposed, and this will be presented to the convention as a recommended specification. A suggested revision of steel-wheel design which consisted in drawings for additional sizes extending down to 21 in. was postponed, together with the matters of new tread-and-flange-contour designs, these being held over for consideration by the ensuing committee on equipment.

J. M. Waldron then presented recommendations from the committee on block signals which included detailed drawings for a standard electric semaphore signal. The proposal of the 1914 committee for a recommended design for a spectacle casting, which was approved at the 1914 convention, was passed as a recommended design, this drawing forming part of the proposed details for the standard semaphore, and the detailed drawings were then adopted as recommended designs. A clearance diagram for semaphore signals, which had received the approval of the committee on power distribution, was referred back to the committee on signals for further consideration in connection with

the recommendations of the convention for last year. In connection with light aspects for signals operated by contactors, the use of the terms car-registering and non-registering were adopted in place of car-counting and non-counting signals.

E. R. Hill then presented a report from the committee on heavy electric traction in which revisions of clearance lines for third-rails were proposed, together with recommended designs for protection of over and under-running third-rails and a standard definition for third-rail gage, all of these proposals being approved by the committee on standards. A proposed specification for coal purchases in the report of the committee on power generation was then submitted by Mr. Welsh. This gives an outline of the points that should be brought out in connection with coal contracts and it was approved for publication in the manual as miscellaneous method and practice.

Following this the report of the committee on way matters was presented by Mr. Kimball, who took up first the matter of rail foundation construction. The Type B of track construction as submitted in last year's report of the committee on way matters was approved as recommended design. Action on Type C, as submitted in last year's report, was deferred until after the coming convention. A classification of soils and screens was then submitted, the plan being approved for entry in the manual as a miscellaneous method and practice. Specifications for special work covering manganese steels, cast steel for track castings, cast-iron rails, splice bars, bolts, tongue switches, etc., were approved for presentation before the convention as a recommended practice.

A design of joints for standard 7-in. 80-lb. and 91-lb. plain girder rails was proposed as a recommended practice, together with a specification for drillings in standard section rails, both of these being approved. The question of symbols or conventional signs for recording surveys was then considered and it was suggested that this subject be considered jointly by various committees so that the existing symbols can be incorporated with those now bearing the approval of the Interstate Commerce Commission in its valuation work. It was suggested that the symbols be printed on a larger scale. This suggestion was approved and the report was referred to the executive committee for amplification by a joint committee so that all classes of symbols may be included. The addition of a missing dimension in the design of joint plates for 7-in. girder and grooved rails was then approved as a revision of the design.

It was recommended that the term "T-rails" be changed to "plain girder rails" in several places in the manual, owing to confusion that sometimes arose with the present nomenclature. This recommendation was approved. The subject matter now in the manual under the title "T-rails in Paved Streets" was revised also by rewording and subdivision, the design for plain girder rail covering the American Railway Engineering Association standard sections of 80-lb., 90-lb. and 100-lb. weight appearing in a separate section.

Chairman Adams then outlined preliminary arrangements that had been made for co-operation with the standards committee of the Transportation & Traffic Association and Mr. Stocks presented a report regarding the extent of the use of association standards by the member companies, prepared from replies to inquiries sent out from the secretary's office. Owing to the small number of replies received to the original circular of inquiry, as well as the apathetic nature of the replies, it was decided to appoint a sub-committee to report on the situation to the executive committee and Mr. Hanna was delegated for this duty.

COMMUNICATIONS

Is the Ultra-Light-Weight Car a Passing Craze?

NEW YORK, July 30, 1915.

To the Editors:

During the last few months I have been very much interested and I must confess somewhat disturbed over the demand for cars of extraordinarily light weight. I am not referring to the use of cars of small capacity as opposed to large units, as that is solely a transportation problem, but there has been a great deal of talk about cars which weigh, completely equipped, less than 10,000 lb., and, according to all of my past experience, this is far too low to provide proper lasting qualities.

In the movement toward lighter weights there is a deadline that has to be recognized eventually. I believe that the present demand has passed this. I have heard of designs for bodies seating approximately thirty-six which are estimated to weight approximately 5000 lb., and some reports even state that bodies of a much lighter weight than this have been proposed, but it is a significant fact that none of them is being built. Is it not true that while a great many managers of railway properties are demanding extremely light-weight cars and have ideas of their own as to how they should be constructed, in every case they want the car builders to stand behind the design and guarantee durability before they will actually undertake the construction, and is it not the case that the car builders are unwilling to do this? If so, there is not much danger in the movement. But I would not like to see the industry adopt a policy of building cars which, like buses, will last only for four or five years.

Naturally, I am interested in knowing whether the car of extremely light weight is really going to come into use. I hope not, because if it does it will be necessary for all of us to revise our ideas on car construction and to make extraordinary provisions for depreciation. On the other hand, since the decrease in jitney competition has become evident, the desire for extremely light cars seems to have decreased also. Indeed it might be daring (in the light of the still-prevalent fever for extremely light cars) to say that the craze is only temporary and will subside.

MANAGER.

Injuries to Persons

LINCOLN, NEB., Aug. 3, 1913.

To the Editors:

The legal profession is fast becoming a dollar institution. The ethical side of life is being forgotten in the mad rush for financial gain. Not only is the profession destroying itself, but it is drawing into its whirlpool of disintegration thousands who are made to feel the sting of financial loss and starting as many more upon a moral decline by inducing them to see a state of facts that has no real existence.

The verdict of a jury is hardly to be considered as evidence of the guilt or innocence of the accused. Courts are becoming temples of technicalities rather than of justice. Case law appears to have more weight than the principles of law that underlie it. Sight is lost of the fact that justice is more liable to result from the application of a principle to a proven state of facts than in applying case law thereto. A little more care on the part of the judges and the members of the bar in rendering decisions and giving advice would save our people millions of dollars annually in Supreme Court expenses, in costs of actions that never should have been brought and in attorneys' fees that never

should have been paid. The entire legal machine is very much in need of reform. This reformation should be from within, and were it not from a spirit of indifference, the fear of offending and the horror of being criticised, it would be.

The wrongs practised are generally known, they are numerous and glaring. One of the most damaging to the profession and to the general public, perhaps, is the present practice in personal injury cases. The loss to the general public by reason of such actions against steam railroads, street and electric railways run into the millions annually. However, the sum paid to the deserving claimants, so long as it is reasonable, is not to be complained of, but that which is paid to the large army of damage hunters and the 50 per cent that is retained by the attorney cannot be criticised too severely.

This item has grown to enormous proportions and is increasing from year to year, regardless of the safety appliances installed and the care and caution used by these corporations to protect the persons of its patrons. In fact, it appears that these transportation companies are really reducing the number of injuries, yet the aggregate sum paid is growing larger each year. For the year ended June 30, 1913, the railways of the United States, not including the street and electric lines, paid for injuries to persons the sum of \$30,410,030, an increase over the previous year of \$1,639,325. During the year 1912 the street and electric railways of the United States paid for injuries to persons the sum of \$20,707,960, an increase over the year of 1907 of \$2,531,655. If this increase with both steam and electric lines has been maintained to date these transportation companies will have expended upon this item for the year ended June 30, 1915, the enormous sum of almost \$60,000,000. Of this the legal profession will have received not less than \$30,000,000 for its services, thus damaging the public by reason of these charges in a sum not less than \$18,000,000 if we allow them 20 per cent, and \$24,000,000 if we allow them 10 per cent for their services. The commercial world pays for its collection when made by suit the sum of 10 per cent on the first \$1,000 collected, and 5 per cent thereafter, and there is no good reason for the attorney charging more in personal injury actions.

To this sum retained by the legal profession we can with certainty add \$6,000,000 paid to undeserving claimants through the efforts of the profession. It can be said with reasonable certainty, therefore, that not to exceed \$24,000,000 of the \$60,000,000 ever reaches the deserving claimant. If the \$24,000,000 now unjustly taken from the railway companies were allowed to remain in their hands, it would go far toward settling the transportation question. Think what it would mean in one decade, almost a quarter of a billion dollars.

The profession has, for years, been educating the people that the transportation companies were outlaws to be preyed upon at will, forgetting to explain that every dollar above a legitimate claim and charge could not be justified, that all personal injury claims are chargeable to operating expenses and must be paid by the patrons of these companies.

The sums paid for injuries are becoming more burdensome from year to year. Something should be done to protect the public as well as the corporations. It is granted that the attorney has the right to contract for his services so long as he is reasonable and just and the public is not damaged thereby. In these cases the public is directly and vitally interested, and if the attorney forgets his duty to that public, the State should, at once, remind him of it in such a manner as to make it impossible for him to go wrong in the mat-

ter of his charges; they should be regulated and fixed. It should be made a crime to charge a contingent fee. Such regulations would save the public millions annually, and the deserving claimant be cared for as well as now. It is clear to both judge and jury that the charges made by the attorney are exorbitant. They understand that the verdict and judgment must be, at least, twice what it should be to remunerate the deserving claimant.

The money loss under the present practice is great, but the loss to manhood is much greater, due to the manner of procuring and prosecuting these claims. The attorney who makes personal injury suits his business has his emissaries at the danger points along the street car and steam lines. The unfortunate one is very often doubly injured by reason of the accident sustained by his person and the blow dealt his moral fabric at being made to understand that he must see the facts through the glasses of his attorney.

Not all the members of the profession are guilty of these practices, nor is it to be presumed that they would be if they had the opportunity, but the silence of all, and the indifference of the many, causes the public to think that one is as bad as the other. Nor has that public forgotten that in order to protect the old soldier from the greed and avarice of the pension attorney, a law had to be promulgated regulating his fee.

STEPHEN S. BISHOP, Attorney-at-Law.

Stone & Webster Official's Views on Motor Buses

To a representative of the ELECTRIC RAILWAY JOURNAL, Frederick S. Pratt, chairman of the board of directors of the Puget Sound Traction, Light & Power Company, Seattle, Wash., and a prominent member of the Stone & Webster Management Association, recently outlined his views relative to the motor-bus situation in the Northwest upon returning to the Boston offices of the firm. Mr. Pratt said that about a month ago a motor-bus service was begun between Edmonds and the main line of the Pacific Northwest Traction Company, the electric interurban road connecting Seattle and Everett, the distance covered being about 3 miles. Sixteen Ford cars are also in use in Everett as an experimental means of handling short-interval travel in small amounts, the cars being run by the Washington Auto Bus Company, affiliated with the local traction company, virtually in competition with the latter's service.

On the Puget Sound Electric Railway, a gasoline motor-bus service is being run by the Auto Bus Company between Auburn and the towns of Buckley and Erumclaw, the last-named place being about 20 miles from the interurban road connecting Seattle and Tacoma. The buses carry twelve passengers each, and through tickets are sold between points on the bus line and the interurban terminal stations.

Mr. Pratt said that the usefulness of the motor bus as a feeder to a trunk line seems on the whole fairly well established. The company's jitney service has been in operation too short a time to yield valuable conclusions, but it is not regarded as a money-making venture as yet, and there is little reason to anticipate financial profit from such service on a 5-cent rate. Definite plans for establishing jitney service in Seattle, as discussed in the local press at various times, are by no means crystallized. It may become necessary to establish such a service, but at present no complete arrangements have been determined, and, in any event, the Stone & Webster interests are convinced of the permanence of the electric railway as the agency for handling the great bulk of city and trunk-line transportation.

Ambulance Trailers in Hanover

The street railway in Hanover has been rendering valuable aid to the authorities in transporting wounded soldiers from the railroad station to the several hospitals in the city in small trail cars like the one shown in the accompanying illustration. The bodies were prepared for their purpose by removing the ends and mounting angle-irons near the floor and at the height of the window sills. On these, acting as rails, small

HANOVER CARS FOR TRANSPORTING WOUNDED SOLDIERS

trucks were placed upon which the stretchers carrying the wounded soldiers could be readily rolled into place. Each trailer accommodates eight stretchers, the length of the body being about 16½ ft. The ends are closed with sail-cloth curtains.

The company has been operating eight of these trailers and some weeks ago had already transported more than 7000 men.

Inventors' Guild Members on Naval Board

In accordance with the invitation of the Secretary of the Navy, the Inventors' Guild is planning to select two of its members for membership in the National Naval Advisory Board, the secretary having been instructed to send to the members of the Guild a brief statement reviewing the situation and a request that each nominate by letter ballot not less than two nor more than four members. These names are to be considered by the board of governors of the Guild with the understanding that from the names received three or more will be selected, the president of the Guild making the final selection of the two nominees.

It is expected that the National Naval Advisory Board will be composed of about eighteen members. Thomas A. Edison has already been appointed chairman, and the large technical societies of the country will each elect two members. The duties of this body will not lie so much in the actual invention of plans and devices as in advising the Navy Department concerning such technical matters as may be submitted for its attention, assisting in the investigation of such matters as are deemed worthy of consideration, obtaining for the Navy Department the assistance of the most competent men in any special technical branch and in offering a trained and receptive ear to inventors. The board will, in fact, form an effective professional connecting link between the people of the country and its trained military experts, it being probable that some arrangement will be made whereby the services of the board will be at the disposal of both the army and the navy.

ELECTRIC-CIRCUIT DIAGRAM CLEVELAND RAIL-BONDING OUTFIT

GENERAL VIEW OF CLEVELAND RAIL-BONDING OUTFIT

be electrically brazed to the rails without interfering with traffic and at a temperature sufficiently low to avoid difficulty.

The device consists of small bonding clamps, which are arranged to be clamped to the lower flange of the rail or to the fish plates, and upon which are mounted two adjustable carbon heating electrodes which are brought to bear against the bond terminal. The electrode holders are equipped with quickly detachable terminals to which are connected flexible secondary leads extending from a transformer of about 18-kva. capacity. The transformer is made portable so that it can be lifted about from place to place. The primary leads to the transformer are connected to a small rotary converter of about 20-kva. capacity which receives power from the trolley wire. This converter is mounted on any suitable car or vehicle. One form of mounting is shown in an accompanying illustration. By extending the primary leads the transformer can be moved along the rails as the bonds are applied, to any desired distance from the rotary converter. The heat is produced electrically directly against the bond terminals by the I^2R loss in the resistance interposed in the circuit at this point by the contact of the electrodes with the bond terminal. The circuit, therefore, consists of the transformer secondary, the flexible leads, the electrodes and the bond

terminal, all connected electrically in series. By this arrangement there is thus introduced into the circuit, at the desired point, a considerable and effective heating resistance permitting of a very substantial reduction in the amount of current ordinarily required to produce the necessary I^2R drop. In consequence, the size of the secondary leads from the transformer are reduced to a point at which they can be very easily handled. The electric circuit is illustrated in the accompanying diagram.

To avoid mutilating the bond terminals and overheating the rail section, silver solder interposed between the bond terminal and rail is employed as a brazing material. Silver solder is an alloy composed of copper, zinc and silver of such proportions that its fusing point is in the neighborhood of 1500 deg. Fahr. This material has to a marked degree the requisites of conductivity and cementing power, with the additional advantage that it forms a perfect union between the bond terminal and rail at a temperature sufficiently low to prevent injury to either. Standard forged-terminal bonds, which have been designed to resist the effects of vibration and which have contact areas commensurate with the cross-sectional areas of the bonds, can thus be used. In other words, in the application of this method most of the objections to the use of thermic processes are removed

APPLICATIONS OF CLEVELAND RAIL-BONDING OUTFIT WITHOUT INTERFERENCE WITH TRAFFIC

and the bond may be permanently and cheaply brazed to the rail.

As shown by the illustrations on page 237, the outfit is assembled into a compact unit and is so arranged as to provide the maximum of portability. In some instances it is placed in a small cart and delivered alongside the section of special work to be bonded, being towed there by an auto-truck and left until the work is finished, whereupon it is moved along to the next job. When the work consists in rebonding rails that have been repaired here and there along the street, the outfit is placed aboard an auto-truck and the leads extended from the transformer to the clamps which have been placed on the rails. In these cases it is unnecessary to remove the transformer from the truck. In outlying districts where the bonding must be done from the tracks along the private right-of-way, removed from roadways, the outfit is placed aboard any suitable car, and where traffic conditions warrant the bonding is done without unloading the equipment. Where conditions are such, however, as to require the car to be removed to a siding in order to clear the main line, the transformer is removed and the primary leads are extended from the car which contains the rotary to the point where the bonds are being applied. In fact, in some cases the primary leads are extended for a distance of half a mile or more on either side of the car to the transformer. This arrangement is such as to afford the greatest utility to the apparatus because of its flexibility.

To summarize, the advantages of this method of bonding have been found to consist of the following: (1) The entire elimination of obstruction to traffic along the rails which are being bonded; (2) the use of silver solder whereby standard forged terminal bonds can be applied very efficiently from the mechanical and electrical standpoints; (3) the absence of pyrotechnical displays in the public highway, due to the low temperature by which the union between the bond and rail is made; (4) the absence of overheated and broken rail sections and mutilated bond terminals; (5) the high degree of flexibility which has been incorporated into the design of the apparatus, resulting in general utility, and (6) the low cost.

Apparatus making use of the method as described above is manufactured by the Cleveland Rail-bond Company and is known as the "Champion Portable Rail-bonding Outfit."

Combined Wheel and Track Gage

BY C. M. FEIST, MASTER MECHANIC SIOUX CITY (IOWA) SERVICE COMPANY

Accuracy in special work installations, with particular reference to wheel and track gages, is obtained by the Sioux City (Iowa) Service Company by checking

COMBINED WHEEL AND TRACK GAGE

underside of the gage bar and the correct track gage to fit this wheel on the opposite side of the bar. This device has been found particularly effective in testing the wheel passages through special work, and makes possible the correction of errors in the track or the wheel gages.

both with a combined wheel and track gage. This gage is shown in the accompanying sketch. It is made of a $\frac{1}{4}$ -in. x $\frac{3}{4}$ -in. steel bar, with the American Electric Railway Engineering Association's standard wheel contour on the

Axle and Armature-Shaft Straightener

BY J. N. GRAHAM, MASTER MECHANIC ROCKFORD & INTER-URBAN RAILWAY, ROCKFORD, ILL.

A good home-made axle and armature-shaft straightener has been in use for some time in the Rockford & Interurban Railway shop with excellent results. The machine was made for the most part from material similar to that which can be found in any railway shop. As will be evident from the illustrations, it consists of a headstock and a tailstock mounted upon a bed made of rails with provision for applying a straightening force at any point by means of an ordinary screw jack. A simple heater permits the axle or shaft to be softened if necessary.

SIDE AND END ELEVATIONS OF AXLE AND SHAFT STRAIGHTENER

(Not to Scale)

Rack to Support Heater Pan

ACCESSORIES FOR AXLE AND SHAFT STRAIGHTENER

The foundation of the straightener consists of three pieces of 6-in. x 8-in. x 4-ft. oak tie to which, at one end, are bolted three pieces of rail about 10 ft. long. This rail may be of any convenient size and the pieces should be placed with spaces of about 2 in. between them.

On this rail bed rest movable heads, in one of which is a fixed lathe center, and in the other a movable center, operated with hand wheel and screw as in the tailstock of a lathe. Patterns had to be made for these heads. In order to guide the heads on the bed, pieces of $\frac{3}{4}$ -in. x 3-in. flat iron, long enough to span the three rails, were bolted on the bottom surfaces and to these were bolted pieces of $\frac{3}{4}$ -in. x 2-in. flat iron, the latter acting as slides to keep the heads in line with the rail.

The following scheme was devised to permit the straightening force to be applied to the axle without

putting a strain on the centers. On the ends of the outside foundation timbers opposite to those occupied by the rail two stands made of $\frac{5}{8}$ -in. x 3-in. flat iron were mounted, their height being such that a rail laid across them was level with the lathe centers. The height of the machine is at the option of the builder, but the one which we are using has the centers 2 ft. above the top of the bed rails. On the stand was mounted a piece of rail 10 ft. long, supported on its side on two pieces of wood sawed to fit the contour of the rail. This piece of rail is loose on the stands so that it can be moved back and forth.

To this jack rail was attached an ordinary screw jack by means of two iron hooks bolted to its base. It is necessary to use a heavy type of jack for this purpose. The head of the jack was removed and replaced by a piece of iron cut out to fit around the axle. A pair of yokes, like those shown in one of the illustrations, are used to hold the jack rail at the proper distance from the axle. These yokes are slipped over the axle and over the jack rail and iron wedges are pushed through slots near the open ends of the yokes and back of the jack rail, these wedges being notched to prevent the spreading of the yokes under pressure. A jack lever, made of $1\frac{1}{2}$ -in. hexagon steel, with ends rounded to fit into the holes in the jack screwheads, is used in applying the straightening force.

Other auxiliaries which are convenient in the operation of the straightener are a dog for turning axles and a heater pan, details of which are shown. The dog is used for turning axles from which it has been necessary to remove the wheels, although in most cases the axles can be straightened without such removal. In most cases, the shaft can be straightened cold but it can be easily heated, if necessary, with the aid of the heater pans made of No. 16-gage, blue annealed steel. The pan is fitted with a small piece of pipe at one end, close to the bottom, for attachment to an air hose, charcoal with air blast being used to prevent the formation of smoke and the production of scale on the shaft.

Economies of the Light Car and of Ball Bearings

BY ARTHUR V. FARR, S. K. F. BALL BEARING COMPANY, NEW YORK

Frequency of schedule and character of service rendered are factors upon which success in modern street railway practice often depend. To operate a faster schedule and reduce headway without materially increasing operating expense is the problem facing the operator. And its successful solution will be welcomed by both operator and public.

The solution to the problem depends upon the answer to this question: Can a car be made which is acceptable to the public and which combines the qualities of light weight and strength to such a degree that the savings in power and maintenance more than offset the additional platform expense where more cars are used? The answer to this inquiry is, "Yes," that the advance in body and truck design not only makes this possible, but such cars are being made and operated with notable success to-day.

The modern type of light car is frequently a single-truck proposition, following the practice of modern engineering design in securing greatest strength for least weight. By the use of the radial truck construction and long wheelbase the riding qualities of the single-truck car approximate those of the double-truck car.

Weight reduction is a matter of recognized importance. Five cents per pound per year is usually accepted as the saving which can be secured in city service by cutting down car weight. On this basis the substitution of a 12,000-lb. car for one weighing 40,000 lb. would save \$1,400 per car annually. Against this saving would be the increased platform expense for the daily rush hours, amounting to not more than \$300 to \$400 per car annually.

The Third Avenue Railway of New York has used

THIRD AVENUE RAILWAY CAR TESTS—FIG. 1—ENERGY CONSUMPTION WITH 9.17 STOPS PER MILE, 26,000-LB. STEPLESS CAR, BALL BEARINGS, RADIAK TRUCK, FOUR PASSENGERS; FIG. 2—ENERGY CONSUMPTION AT 7.5 M.P.H. SCHEDULE SPEED, SAME CAR; FIG. 3—COMPARATIVE TRACTIVE EFFORT WITH PLAIN AND BALL BEARINGS RESPECTIVELY

SAVINGS DUE TO BALL BEARINGS—FIG. 4—CURRENT CONSUMPTION RECORDS SHOWING COASTING WITH PLAIN AND BALL BEARINGS RESPECTIVELY

Solid Line, Plain Bearings; Dash Line, Ball Bearings; Shaded Area, Saving Due to Ball Bearings.

the light type of car to advantage and has reduced the car weight per seated passenger from between 800 and 900 lb. (average for typical double-truck cars in city service) to 650 lb.

The biggest item of economy is, of course, power saving, and the use of ball-bearing journals further increases this item. The reduction of power consumption, especially at the peak of the load during rush hours, affords an opportunity for immense economy. The use of light cars reduces the required investment for power stations and substations to the extent of \$1,000 to \$2,000 per car, or, in the case of existing properties, permits the operation of a greatly increased car mileage.

Tests show that the starting effort required is reduced 55 per cent when ball bearings are used. The reason for this reduction is this: plain bearings, depending upon a film of oil to separate the journal from the bearing lining, bind when the car stops. The pressure of the car on the journal squeezes the oil out, and in starting the rubbing friction of two metal surfaces

city cars weighing 40,000 lb. and more. Compared with these the saving would be still more in favor of the light car.

The comparison is between a forty-passenger car weighing 26,000 lb. and a twenty-nine passenger car weighing 10,000 lb., operating over the same route during a period of twelve hours daily.

One of the chief considerations of almost every part of car equipment is its bearing on accident reduction. Doors, steps, brakes, brakeshoes, wheels, axles, and bearings (if of the anti-friction type), all play an important part in helping to reduce accident. Ball bearings permit a car to be more easily manipulated, and easy manipulation means quicker starts and freedom from jolts at starting, as cars can be started with smooth, constant torque. Not only do ball bearings help to reduce the number of accident claims, but being more durable than plain bearings they reduce the liability to car accidents in service.

Among other advantages of ball bearings are the following: Lubrication cost is saved to the extent of 85 per cent. As the bearing housings are sealed, there is no leakage and lubrication is required but once in three months. There is also a saving of from 35 per cent to 70 per cent in maintenance cost, and heating of journals is eliminated. When used on the motors the ball bearings insure uniform air gap, aid in commutation and reduce gearing and bearing wear, at the same time permitting a shortening of the motor by from 10 per cent to 20 per cent.

	Forty passenger Car	Twenty-nine passenger Car

Cost of energy per day—nine cars.....		\$10.71

in contact must be overcome. The starting friction of ball bearings, on the other hand, is no greater than the running friction. They do not depend upon a film of oil, so start easily from rest and operate at uniformly high efficiency.

The decreased bearing friction with ball bearings permits a car to coast farther than one equipped with plain bearings. Because of the higher rate of acceleration and the ability to coast at much slower speeds, the ball-bearing equipped car can be operated a very much larger part of the time on the coast, between corners when making stops and on slight grades in city districts where the grades are of little or no value to the plain-bearing car.

The advantage which the ball-bearing car secures from these long coasting periods cannot only be accurately determined by experimenting in a congested city, but by comparing the ease with which a 9000-lb. car can be moved by hand when mounted on ball bearings and the amount of force necessary to move a forty-passenger bronze-bearing car in the same way. One can in this way readily appreciate what this coasting factor amounts to.

The increased revenue by the use of light cars, in comparison with cars of greater weight is illustrated by the accompanying table. In this instance nine light cars replace four heavier cars, making schedules appropriate to the increased number. It will be noted that the larger car, weighing 26,000 lb., is small compared with

Test of Kansas City Air Washer

The Metropolitan Street Railway, Kansas City, Mo., has recently completed the installation of two air washers in connection with its largest turbo-generating plant at the corner of Second Street and Grand Avenue, and the company's engineering department now announces the successful outcome of its tests of the machines, which have a capacity of 80,000 cu. ft. per minute each. The installation includes complete equipments of motors, pumps, patented spray nozzles, spray piping, screens, eliminator plates and other necessary appliances.

According to the railway officials, the expense of installing and operating the air washers has been more than justified by the results obtained—the removal of practically all the dust in the air entering the washer

KANSAS CITY AIR WASHER—SPRAYING EQUIPMENT

KANSAS CITY AIR WASHER—PUMPING UNITS AND TEMPERING COILS

and the cooling of the air to the wet bulb temperature, thus increasing the capacities of the turbo-generators from 12 per cent to 15 per cent. The installation will undoubtedly prevent expensive burn-outs that are liable to result from carrying overloads, with an accumulation of dirt on the windings, and is believed by the railway electricians to constitute an effective insurance against the losses due to decreased efficiency and the delays required for repairs and cleaning the generator windings.

The new machines, shown in the accompanying illustrations, were purchased by the Metropolitan Street Railway from the Spray Engineering Company, Boston, Mass., which followed its usual custom in erecting them for the purchaser. About 350 ft. of 1-in. galvanized steam piping were included in the equipment of each washer, to be used as tempering coils to reduce the humidity of the outgoing air, when required. These coils are constructed so as to operate satisfactorily under a steam-gage pressure of 5 lb. per square inch. The air-washer equipment furnished renders it unnecessary to have any extra equipment for washing down the eliminator plates, thus considerable expense is avoided. The eliminators consist of vertical plates, so arranged as to provide a large wet surface. The washers are guaranteed to operate efficiently for ten years.

Each pump unit of the machines is mounted on a heavy cast-iron bedplate, so constructed as to extend under all parts. This arrangement prevents oil and water from dripping from the pumps and motors on to the floor, the bedplates being flanged and set at an incline so as to give perfect drainage. The motors are capable of operating without deterioration in a moist atmosphere from 40 deg. to 50 deg. Fahr., and the pumps operate readily with a 60 per cent efficiency. All piping and fittings are of galvanized iron to prevent corrosion incident to a humid atmospheric condition.

The tests made in Kansas City have interested a great many electricians of the Southwest who came to witness them. The assistant electrical engineer reports that in the tests thus far made, the washer passes no free moisture that will show on a plate of clean glass held at a distance of 8 in. from the eliminator. The test for cleaning consisted in sifting 5 lb. of dry boiler soot into the mouth of the washer at a temperature of 70 deg. At the same time, a sheet of clean white paper was held at right angles to the air flow at about 6 in. from the flow openings. This test was conducted for ten minutes, after which not a trace of soot could be found on the paper. With a view to seeing what

result would show in the case of the finest dirt, two wire screens were covered with a thin film of absorbent cotton, and one of these was inserted in the air duct to intercept the air as it entered the washer, while the other was placed in the duct leading from the washer. The first screen was allowed to remain in the air current continuously for six hours and the second for two weeks. At the end of the latter period it was found that the second screen showed no more soiling than the first, which had been exposed for the shorter period.

Grinding Rail with Carborundum Track Brake Shoes

To hasten the grinding of rail the United Railroads of San Francisco replaced the blocks used for wooden track-brake shoes on several of its single-truck service cars by carborundum blocks which are clamped into the same holders, four 2-in. x 4-in. x 8-in. blocks being used per car. The cars are run over the track with dragging shoes until the rail has been properly ground, the process lasting from a few days to as

SINGLE-TRUCK CAR FITTED WITH CARBORUNDUM RAIL-GRINDING SHOES

many weeks, depending upon the condition of the rail.

The cars are run at regular speeds while grinding in this unusual manner, and where possible they are run back and forth over a given piece of rail. Owing to the noise made by the grinder, night work is carried on only in business sections like lower Market Street, but on the less-traveled tracks in residence sections day operation is entirely feasible. No less than seven cars have been equipped for this work.

CLOSE-UP VIEW OF CARBORUNDUM RAIL-GRINDING SHOE.

A Simple Feed-Water Recorder

The feed-water recorder that is furnished by the Hoppes Manufacturing Company, Springfield, Ohio, in connection with the well-known Hoppes feed-water heater, is a device of unusual simplicity, although it is guaranteed to be accurate within $1\frac{1}{2}$ per cent by actual weight at any temperature and at any rate of flow. Its operation is based upon the principle of the V-notch

EXTERIOR VIEW OF FEED-WATER HEATER, TANK AND RECORDER

weir, and no engineering features that are not thoroughly understood have been incorporated in the design.

The meter consists of a storage tank divided into two parts by a diaphragm with a V-notch at the top. A cabinet is attached to the side of the tank by a bracket, and inside of this is a weighing vessel suspended by a coil spring, the vessel being connected to the interior of the tank by flexible bronze hose in such a manner that the water in it will always be at the same level as the water behind the weir. As the water rises behind the V-notch it also rises inside the weighing vessel, and as this vessel is so shaped as to contain just enough water at each unit of height to draw down the spring in a direct ratio to the rate of flow, the pen and recorder are directly attached to it without the use of cam or other motion-changing device.

The recording and indicating device is located in the

VIEW OF RECORDER CABINET WITH DOOR OPEN TO SHOW WEIGHING VESSEL

head of a column that is supported by the cabinet. A clock movement operates a circular chart on one side, this making one revolution in twenty-four hours, and on the other side is an aluminum disk making one revolution per hour. The pen for making the record on the chart is attached to a crosshead that moves vertically and is directly connected to the weighing vessel. An arm is carried to the other side, and this supports a small planimeter which is mounted on a vertical axis and is revolved by the aluminum disk.

The planimeter wheel moves a train of gears and operates an integrator which records the amount of water in pounds that has passed the wheel. When the water is just starting over the V-notch the planimeter wheel rests at the center of the disk. As the head increases the wheel is drawn downward, and as the wheel moves away from the center the increase in the radial distance increases the rate of travel as the disk has a constant rotary motion.

Where the tank of the feed-water heater is placed above the floor line, or on a floor that is above the most desirable place for locating the recorder head, an inverted head can be attached to the bottom of the cabinet and can be carried as far below the cabinet as desired. If it is more convenient to read the record from the floor above the installation, an extension can be furnished and the head raised to any height desired above the cabinet.

Adjustable Seat for Motorman

E. L. Stephens, master mechanic Los Angeles (Cal.) Railway, has recently applied for patents on the motorman's seat illustrated as in use in the accompanying half-tone. The seat is attached to a curved arm which sets

ADJUSTABLE SEAT FOR MOTORMAN

in an automatic eccentric grip attachable to any of the vestibule stanchions. The seat may be swiveled at any angle, and may also be raised or lowered at will by raising a cam which compresses a spring that keeps the seat in any set position. Thus the user of the seat can adjust it to suit himself. The San Diego Electric Railway has placed seats of this design on its latest cars.

Another seat designed later by Mr. Stephens includes a spring in which the seat pivot can be set to give easy riding.

LONDON LETTER

(From Our Regular Correspondent)

The work of electrifying the Lancashire & Yorkshire Railway's branch line to Bury, via Prestwich, is now almost completed. It had been hoped to have this line opened to the public this month, but that is now found impossible, because of the war. Experiments have recently been made on certain sections, over which trains have been run, current for this purpose having been supplied by the Manchester Corporation. The principal work that remains to be carried out refers to the big power station that is being erected near to Clifton Junction. This new railway scheme is to afford a better service between Manchester and Bury. In normal times there are about sixty stopping trains on this line. For the new electric service the third-rail system is to be used, this being similar to that on the Liverpool-Southport line. There will, however, be this difference, that a different voltage will be employed. The trains are to consist of long and wide corridor carriages of the saloon type, and each is to have accommodation for about 100 persons.

For something like fifteen years the City & South London Railway—the oldest of the London tubes—has been a subject of special interest to all concerned in the transmission and distribution of electrical energy. There is no other railway or tramway in England, and it is a question whether there is any in the world, which is worked on the three-wire system. The "outer wires" are formed by the conductor rails of the two tracks and the running rails form the "neutral wire." With such a frequent service of trains as that run on this railway the load on each side of the neutral is fairly evenly balanced. As a result of the recent consolidation of interests among a number of the London Underground Railways, the three-wire system is likely to be superseded by the method employed on the other lines, namely, transmission by high-tension three-phase current to substations and thence by simple low-tension d.c. circuits to and from the motors of the trains. Thus a very interesting and successful demonstration of the three-wire system of traction will pass away.

The bill to authorize the City & South London, the Central London, the London Electric, and the Metropolitan District Railway companies, to make arrangements with each other and with the London General Omnibus Company for the purpose of providing increased facilities for the interchange and alternative routing of traffic, has been passed for second reading and committee stages by the examiners of the House of Lords. The promoters have agreed to amend the bill by deleting all powers dealing with interchange of traffic, etc., thereby limiting the measure to the pooling of the receipts of the companies and also to insert a clause making it clear that no statutory powers shall be conferred on the London General Omnibus Company.

The Bristol Tramways & Carriage Company has been successful, in the Chancery Division, in securing the sanction of the court to the extension of its object to enable the company, among other things, to make and arm motor cars and aeroplanes.

The Underground and its allied companies have subscribed for £800,000 in the war loan. Provision has been made by the T.O.T. group enabling their employees to invest in the loan by deductions from their wages at the minimum rate of 2s. per week.

The recent strike of the London tramwaymen has resulted in a net loss of more than £100,000. Last year's report showed that there was a deficit of £33,000, and nothing was available for the reserve fund. This year's estimates, prepared before the strike, anticipated a deficit of £91,000, due principally to allowances to those who have enlisted. The strike has made the financial situation serious, and before the end of the year it is likely that the general reserve fund will be exhausted. The men, too, are demanding increases. The arbitration court has just decided that in the case of the men in the electrical section the war bonus of 3s. a week shall be extended from men earning 30s. and under to men earning up to £2, and no doubt the conductors and motormen will secure this concession. Unfortunately, the Treasury has held up the Council's scheme of linking up and consolidation.

The Dublin United Tramways Company has recently suffered loss by the deaths of two of the best-known members of its staff. C. W. Gordon, manager of the tramways, died suddenly on May 27 while riding, and R. S. Tresilian, secretary of the company, died on May 29 after a severe operation. Both gentlemen were well and favorably known to most of the members of the tramway fraternity in Great Britain, and members of the two tramway associations of Great Britain will not be likely soon to forget the kindness of these two gentlemen on their visit to Dublin in 1910. W. M. Murphy, the chairman of the company, who is well known not only in Great Britain, but also in America, has received many tokens of sympathy on his being deprived so suddenly of the services of his two right-hand men. In the meantime, George Marshall Harriess, chief electrical engineer, has been appointed as general manager, and Mr. M'Hugh, chief accountant, has been appointed as secretary. Other new appointments have been made, all from the existing staff of the company.

F. Ayton, M.I.E.E., presented a report of the electric vehicle committee to the members attending the meeting of the Incorporated Municipal Electrical Association recently held in London, in which it was stated that there were now three municipal tramway undertakings making use of the electric bus as an adjunct to their tramway services, namely, Southend-on-Sea, South Shields and York. In all three instances it was understood that the vehicles were giving satisfaction. Other corporations are considering the adoption of electric vehicles for various purposes, and it would appear that before long a number of these vehicles would be in regular service.

Following the example of other cities and towns—Glasgow, Newcastle, Sheffield, Salford, Aberdeen, Cardiff and Blackpool—the Birmingham tramways committee has decided to employ women as conductors to help make good the shortage in this class of labor caused by the war. An experiment will be made on the Bristol Road and King's Norton cars, with fifty or sixty women, and if they come up to requirements more will be engaged for other routes. By this means the committee hopes to lessen the difficulties in the working of the system caused by the shortage of about 120 men as drivers and conductors. The men's union offers no objection whatever to the employment of women as a temporary expedient, and especially in view of the fact that the old hands have had to work long hours since the depletion of the staff began. Evidence obtained from other towns where female labor has been employed is without exception to the effect that women have given satisfaction as tramway conductors.

The Local Government Board has authorized the Manchester Corporation to borrow £432,470 to enable it to proceed with the erection and equipment of the large new electric generating station at Barton. Some months ago the station, with its complete equipment, was estimated to cost £1,775,000. Prices have risen since then, so a larger sum will probably now be required. The loan just sanctioned is, however, deemed sufficient to cover the cost of the first complete section of the scheme. A somewhat higher sum was originally submitted to the Local Government Board in respect of this section, but the estimate was cut down to meet the views of the Treasury. The scheme for the complete station provides for a plant capacity of 160,000 kw.

The introduction of women into the Hull tramway service threatens to cause serious trouble among the men employees. The tram drivers and conductors have unanimously passed a resolution declaring that they will refuse to work with women conductors and calling for their withdrawal. They contend that there are sufficient men not eligible for military service who are willing and capable of taking up temporary positions as conductors, and they object to the employment of women on the ground that it encourages the practice of employing casual labor. Discussing the position, the Lord Mayor, who is chairman of the Hull Corporation tramways committee, stated that it was absolutely impossible to get suitable men. If they could be found they would be employed, but he stated emphatically that he would not move from the decision to employ women, and the committee would, he believed, support him.

News of Electric Railways

ACTION ON RAPID TRANSIT CONTRACTS

Three Contracts Aggregating \$7,022,540 Awarded by New York Commission

The Public Service Commission for the First District of New York during the week ended July 31 acted upon rapid transit contracts aggregating \$8,714,911. The total awards of the week totaled \$7,022,540, and one contract amounting to \$1,692,370 is expected to be awarded soon. The contracts awarded included the only remaining section of the Broadway subway in Manhattan, and next to the last underground section of the Eastern Parkway subway in Brooklyn. The contracts follow:

Section No. 3 of Routes Nos. 4 and 36, the Broadway subway in Manhattan. Section No. 3 extends from Thirty-eighth Street northerly under Broadway to Times Square, and thence northerly under Seventh Avenue to Fifty-first Street. Awarded to Holbrook, Cabot & Rollins Corporation, the lowest bidders, for \$3,740,913.

Section No. 3 of Route No. 12, the Eastern Parkway subway in Brooklyn. This section extends from about Nostrand Avenue easterly under Eastern Parkway to Buffalo Avenue. Awarded to Rodgers & Hagerty, Inc., the lowest bidders, for \$2,170,652.

Section No. 1 of Route No. 49, the Culver elevated line in Brooklyn. Section No. 1 extends from a point near Thirty-seventh Street over Gravesend Avenue to a point near Bay Parkway. Awarded to Post & McCord, Inc., the lowest bidders, for \$877,959.

The Broadway subway and the Culver line are both for operation by the New York Municipal Railway Corporation, while the Eastern Parkway subway, which is an extension of the existing subway, is for operation by the Interborough Rapid Transit Company.

In addition to the construction contracts, the following awards were made for track materials, which will be used on about 230 miles of single track of the dual system, covering all lines not already provided for: Track rail splice bars, the Rail Joint Company, \$197,106; nut locks, Robert F. Horsey, \$735; anti-creepers, the Creepcheck Company, \$35,174.

The commission has laid out a new rapid transit route, to be known as Route No. 61, providing for the construction of a new tunnel under the East River from Sixtieth Street, Manhattan, to the Queensboro Bridge Plaza in the Borough of Queens, where it will connect with the new rapid transit lines in that borough running to Astoria on the north and to Corona on the northeast. This action was taken in pursuance of resolutions adopted by the Board of Estimate and Apportionment asking that the tunnel route be substituted for the original route over the Queensboro Bridge. The new route is for operation by the New York Municipal Railway Corporation in connection with the Broadway subway in Manhattan and the new lines in Queens, over which this company will have trackage rights. In December, 1914, the Degnon Contracting Company proposed the change from the bridge to the tunnel, and in February, 1915, that board adopted resolutions requesting the Public Service Commission to submit a plan for a tunnel and to prepare for introduction in the Legislature such amendments to the rapid transit act as would be necessary to enable the city to make the change. The commission immediately caused to be introduced in the Legislature the required act, which was enacted into law. The proposed change was submitted to Alfred Craven, chief engineer of the commission, who made two reports thereon in March, in which he favored the bridge route. These reports were transmitted to the Board of Estimate, and on July 21 that board adopted further resolutions declaring that "it is still the opinion of the board that ultimate economy will best be served through the substitution of a tunnel connection for the proposed connection across Queensboro Bridge." The Degnon Company in its proposition to the Board of Estimate stated that it would submit a bid for the construction of the tunnel not to exceed \$4,500,000, and it would agree to complete the work within two and

a half years. If this is possible it will not materially delay the beginning of operation of the Broadway subway in Manhattan.

DETROIT STOCKHOLDERS APPROVE SALE TO CITY

Stockholders of the Detroit United Railway, at an adjourned meeting on Aug. 2, approved the proposed purchase contract between the city and the company. More than 80 per cent of the stock was represented at the meeting.

The necessary papers have been signed by the officers of the company and returned to the board of street railway commissioners, ending the company's participation in the proposition for the present. The next step is to be taken by the members of the Street Railway Commission, upon whom devolves the duty of setting the machinery in motion to get the purchase contract before the electors. Inasmuch as Chairman Couzens is absent from the city and his signature is required, it probably will be two weeks before the contract is in shape for presentation to the Common Council. After it reaches the latter body it must lie on the table for thirty days before it can be placed on a ballot at a special election. It is not expected that the contract will be held up in any way by the Common Council as the latter body has not been inclined to interfere with the Street Railway Commission in any of its proposals. At present the submission of the plan to the electors about Oct. 1 seems likely.

The Detroit United Railway, through *Electric Railway Service*, its official publication, announced that inasmuch as it is a party to the contract it will not participate in any discussion concerning it. What is regarded as the company's last statement on the proposal says:

"We feel sure we will be pardoned for expressing some slight objection to one feature of the pending propaganda—that is, picturing the Detroit United Railway as a sort of 'foreign devil' because part of its earnings go to the absent owners of some of its securities. We particularly object to that suggestion because the Detroit United Railway will be charged with the responsibility of presiding over more than 600 miles of Michigan electric railways even after the city lines are taken over by the city of Detroit. We further object because the truth is that almost as many Detroit United Railway securities are owned here at home as are those of Detroit's principal newspaper corporations and those of the city of Detroit itself. It is, furthermore, doubtless true that at least 99 per cent of the automobiles manufactured in Detroit are dependent upon the purchasing power of absent owners. No one should Chinaize or Mexicanize the city of Detroit with the thought that outside investors are to be invited in only to be snubbed or to have their pockets picked."

NEW YORK'S CONSTITUTIONAL CONVENTION MAKES SLOW PROGRESS

Senator Root of New York recently warned the constitutional convention that it was far behind schedule and that the delegates must give their entire time to the task before them if they wish to complete their work in time to submit a revised constitution to the people this fall. On Aug. 1 the convention had been in session four months and in that time had tentatively approved four out of 707 proposals introduced. These four proposed amendments have been advanced to third reading and put aside for final consideration at a later date. Two other proposed amendments have been defeated in committee of the whole. Thirty-four others have been reported favorably by standing committees, and are now awaiting debate. It was expected that by the close of the week ended Aug. 7 the standing committee would have placed in its hands amendments embodying the projects of the reorganization of the State government by the co-ordination of departments and by the application of the short-ballot principle to the elective offices of the State; the reform of the financial system of the State by the establishment of an executive budget; the freeing of municipalities from legislative interference with their private affairs by a broad grant of home rule, and the attainment of a speedier and more systematic administration of justice by the revision of the judiciary article of the constitution.

The proposal for an appointive judiciary has been rejected by the judiciary committee. The committee on legislative powers, of which William Barnes is chairman, has reported favorably to the convention Mr. Barnes's amendments designed to prohibit the Legislature from enacting advanced social legislation, notably a minimum-wage law. On the other hand the committee on industrial relations has reported in favor of authorizing the Legislature to pass a minimum-wage law. Mr. Barnes's committee has also indorsed the Dunmore amendment, requiring that all regulations by boards and commissions in the exercise of the police power should be "reasonable," and so subject to review by the courts. It appears that there is every prospect of the passage of an amendment making cumulative voting compulsory in the election of corporation directors.

A digest of the proposals contained in the completed draft of the amendments advocated by the committee on public utilities with respect to the public service commissions was published in the *ELECTRIC RAILWAY JOURNAL* of July 31, page 202.

TOLEDO TENTATIVE DRAFT COMPLETED

Report of Franchise Committee Reviewing New Grant Printed in Full

At the close of the conference between the franchise committee of the Toledo City Council and the representatives of the Toledo Railways & Light Company, Toledo, Ohio, on the evening of July 29, Henry L. Doherty, chairman of the railway board, left for New York to confer with his associates in regard to the tentative draft of the new franchise as prepared and the report of the committee, which is to accompany the grant when presented to the City Council. Mr. Doherty and the committee had disagreed on the report because the committee refused to include anything that could be called a recommendation for the action of Council on the franchise. The committee told the railway's representatives that they did not expect Council to do anything further than refer the grant to the voters for action. Mr. Doherty contended that the work that has been done in preparing the draft would amount to nothing unless Council either accepted or rejected the proposal.

A copy of the report was submitted to the Toledo Railways & Light Company on July 29 after it had been revised to some extent by the committee. When Mr. Doherty found that the committee was fully committed to the report as it then stood he asked for time to submit it to his associates. The committee made some objection, but Mr. Doherty said if the report had been furnished to him just after the close of the last conference on the previous week he would have had his reply ready. It was agreed that another meeting should be held on Aug. 3, when Mr. Doherty expected to give the committee his decision as to both the tentative draft and the report. The report, as it stood at the close of the conference on July 29, is as follows:

"At the end of the try-out period Council is required to establish a rate of fare which will cover the cost of operation, the cost of maintenance and a 6 per cent return to the company for a period of five years or more if neither party requests a new fare at the expiration of five years; further, the fare thus established by Council cannot be questioned in court or by arbitration until it has been in operation for six months and it cannot be disturbed by any court or by any arbitrators to whom it may be submitted, unless it is clearly proved by the company that the fare is insufficient to cover the operating and maintenance costs exclusive of interest on bonds, and a 5½ per cent return upon the value of the property.

"There is only one condition under which the fare fixed by Council may be brought in question before the expiration of the six months' period, and that is when the company is able to prove to the commissioner of public utilities of the city, who will be an officer under the new charter, that the rate of fare fixed by Council is insufficient to produce a return in excess of 3 per cent upon the value of the property, in which event the question may be submitted to arbitration.

"If the fare is found by arbitrators or a court, as the case may be, in a final hearing of the question, to be insufficient

to meet the three items named, then the fare is abolished and Council has ninety days in which to establish a new rate of fare, and during the ninety-day period the fare will be seven tickets for a quarter for adults, and if Council fails to establish a fare within the ninety-day period, then the arbitrators or court, as the case may be, may fix the fare to prevail after the ninety-day period until the Council does establish a new rate of fare.

"As to municipal ownership, the ordinance expressly reserves to the city the full, complete and absolute right and authority at any time, upon twelve months' written notice to the company, to acquire the railway property at its true value, which shall be determined by three arbitrators appointed, one by the city, one by the company, and the third by those two, and the valuation shall be made as though no franchise rights existed, and all franchise rights terminate at once when the city takes over the property. This also gives the city the right to issue its bonds and make them a lien upon the property by a trust deed, together with a franchise to the trustees of the bonds for the benefit of the purchaser of the property in the event of a foreclosure sale of the property.

"At the end of ten months a try-out period of twelve months begins, during which time the fare for adult passengers shall be five tickets for 15 cents, and the entire system during the try-out period will be under the control, direction and management of three commissioners appointed by the city, thus affording the very best opportunity to the citizens to ascertain for themselves whether a 3-cent fare is practical.

"These commissioners will have full access to and control of all the books, records, incomes, expenditures and all the affairs of the company, and will be required to furnish monthly reports to the city setting forth all the information secured relating to the railway business.

"During the try-out period three arbitrators, one chosen by the city, one by the company and the third chosen by the former two, will value the property, which valuation is to be made without reference to any franchise rights or privileges, and shall be made as though no franchise rights or privileges existed.

"The ordinance reserves to the city at all times control over the operation of the system, the character of the equipment, the schedule and routing of cars, the maintenance and extension of lines and the right to fix the fare to be charged during the time the franchise continues, and control of interurbans.

"The proposed ordinance contains many other features suitable to the needs of the city and of the railway system, but the foregoing are perhaps the more salient features of the proposal, to which the committee desires particularly to call attention at this time.

"The ordinance provides definitely for maintaining the railway system and property at a high state of efficiency at all times, which the committee believes will prove very effective and beneficial. It provides for a rearrangement of the railway system, the rerouting and scheduling of cars during the first four months that the ordinance is in effect by a committee appointed by the city, including a proposed crosstown line and necessary extensions. It requires the company to equip the entire system with pay-as-you-enter or pay-as-you-leave cars with fare box receivers, and to do the necessary work during the first ten months of the ordinance to make the existing lines conform to the rearranged system."

Phil Hassenzahl, chairman of the franchise committee, received a letter from Henry L. Doherty on Aug. 2, in which he said that after a conference with his associates in New York it had been decided that the company could not accept the franchise prepared unless the committee asked Council to approve or refuse it before presentation to the voters. Mr. Doherty says that the majority of the members of the Council were elected nineteen months ago on their promise to settle the street railway franchise trouble. Only three months of their term remained. He felt, therefore, that if the members recommend or reject the draft, it can be put before the people upon its merits.

The letter was read to the committee on the afternoon of Aug. 2 and some discussion followed. The members do not agree with Mr. Doherty in the original understanding that the committee was to make the recommendation he asks.

They also consider that the street railway question has already been divorced from politics.

OFFICERS TESTIFY IN RHODE ISLAND ARBITRATION

At the continued hearings at Providence, R. I., in the Rhode Island Company wage arbitration, officers and employees of the transportation and allied departments have testified at length upon the duties, compensation and qualifications of men in the car service. Counsel Vahey for the employees' union stated that the men's side of the case would probably be completed by the end of the first week in August, leaving a week or ten days as the probable time required for the presentation of the company's case.

R. Roscoe Anderson, superintendent of transportation, expressed the opinion that a guaranteed minimum number of hours a day for spare men was undesirable in view of the cost to the company and the tendency toward reducing the amount of work available for the more industrious men. He did not look upon platform work as skilled labor in the usual acceptance of the term. Between 50 and 75 per cent of the blue-uniformed men were first-class workers. No change in the schedules was made after the formation of the union, and the speed of the city cars had not been increased materially.

William D. Wright, supervisor of equipment, described the duties of the shop organization and carhouse forces. Representative hourly wage rates were: painters, 19.5 to 30 cents; wood workers, 25 to 30 cents; blacksmiths, 28 to 31 cents; helpers, 22 to 28 cents; toolmakers, 35.5 cents; machinists, 29 to 32 cents; machine hands, 22 to 28 cents; bench hands, 20.5 to 25.5 cents; overhaulers, 24 to 28 cents; firemen, 25 cents. Frank H. Brown, superintendent of the northern division, testified that in his opinion the maximum wage of motormen and conductors was sufficient. Several men who left the road's employ had returned stating that they could earn more money on the road than outside. Many of Mr. Brown's spare men were earning from \$12 a week up, and regular men frequently earned \$18 or \$20. The younger men appeared less willing than the older employees to work hard.

Brayton E. Sweet, superintendent of the Mount Pleasant division, said that he was "old-fashioned enough to believe that if a man was not satisfied with his pay he could go elsewhere." The work of motormen and conductors in Providence had grown lighter in recent years. The majority of men having full day cars were very well satisfied with wages and working conditions.

William D. Mathewson, superintendent of the Olneyville division, thought the men were being paid enough under present business conditions. The point was brought out that the secret service branch of the company reported meritorious acts as well as violations of rules.

Charles E. Redfern, claim agent of the company, informed the board that the cost of accidents to the road in 1914 was more than \$300,000. About 9000 were reported, of which between 3500 and 4000 called for a money settlement. Many accidents occurring in the neighborhood of cars did not, however, concern the company in any direct way. Ten adjusters were employed by the claim department.

Upon request of the union, the company presented data as to average earnings. In 1908 1343 employees averaged \$606.17 a year, and in 1914 1634 employees averaged \$714.74. In the week ending April 9, 1915, 151 spare conductors averaged \$12.82 and 142 spare motormen \$14.18. The weekly average for all uniformed men in 1914 was \$13.

A. E. Thielson, superintendent of the Danielson division, testified that sixty-three men worked under his direction, including several power plant employees and linemen. Men in the freight service had no regular hours, but probably worked from twelve to thirteen hours a day, with an average wage of 28.5 cents an hour, and 33.5 cents an hour for all time above ten hours. On this branch of the system the chief engineer of the power station received \$28 a week of seven days, working twelve hours a day; two oilers were paid \$21 a week for a twelve-hour day; firemen worked eight hours daily for seven days a week at 25 cents an hour; track greasers worked ten hours a day at 20 cents an hour; trackmen received 20 and 22.5 cents an hour, and foremen 25 and 35 cents.

P. R. T. WITHDRAWS OPPOSITION

The Philadelphia (Pa.) Rapid Transit Company, in a formal document forwarded to the Public Service Commission on July 30, withdrew its opposition to the city's petition for a certificate of public convenience, a technical procedure necessary before the city can proceed to the building of the Broad Street subway and the Frankford elevated. The statement sent to Harrisburg sets forth that one of the reasons for withdrawing opposition to a certificate of public convenience is "in order that public improvements, duly authorized by City Councils, may proceed without delay." The memorandum as filed by the company follows in full:

"The Philadelphia Rapid Transit Company, while asserting its rights under the contract of July 1, 1907, to a ninety-day period within which to accept or reject the construction of the high-speed lines for which the city now asks a certificate or certificates of public convenience, and further asserting its contract rights on Broad Street vested in the Thirteenth & Fifteenth Streets Passenger Railway under the act of March 27, 1873, whereby, in consideration of that company surrendering its right to build and operate a railway along Broad Street, the State of Pennsylvania covenanted that said street should not be thereafter used for transit facilities competing with the lines of said company on the adjacent streets, viz., Thirteenth Street and Fifteenth Street, which contract rights it asserts are inviolable, subject only to taking with compensation under the power of eminent domain duly exercised.

"Nevertheless, in view of the evidence presented at the hearing before this commission, showing that more than twice as many citizens will be served by the high-speed lines if operated by the Philadelphia Rapid Transit Company than if operated by an independent company, and of the statement by the Director of City Transit that in his opinion it is preferable to have them operated by the Philadelphia Rapid Transit Company, and believing that at the proper time a contract for the operation of these lines will be offered by the city of Philadelphia to the Philadelphia Rapid Transit Company which can be accepted and which will fully and fairly protect it from a competition which it is asked to set up against itself, and in order that public improvements duly authorized by City Councils may proceed without delay, hereby withdraws any protest and objection which it may have entered in respect to the granting of the certificate or certificates of public convenience prayed for by the city of Philadelphia."

CHICAGO ELEVATED MEN REJECT OFFER

After a series of conferences between the officials of the employees' union and Britton I. Budd, president of the Chicago (Ill.) Elevated Railways, a tentative agreement was reached in the settlement of working conditions and wages. This was submitted to the employees in referendum, but was rejected by a vote of 1684 against to 659 for the proposal. The essential points in the company's offer to the men included an increase in the maximum wage, which was 34 cents an hour, of 2 cents an hour for the first year of the contract and an additional 2 cents an hour for the second year of the contract. It was also agreed that as soon as a man was made a regular motorman he would receive the maximum wage. Formerly men were required to serve for one year as regular motormen at 30½ cents an hour. The plan of advancement of trainmen on elevated railways in the past has provided that they should start as guards at 23 cents an hour, which amount in the offer was increased to 25 cents an hour at the close of the second year, and advanced successively to extra motormen and then to regular motormen. The offer to the employees provided practically no changes in the working conditions, which were deemed satisfactory. As a result of the refusal to accept the tentative agreement, all questions of wages and working conditions will be referred to a board of arbitration, of which Mayor Thompson will be the referee. State Attorney Hoyne, who represented the employees of the surface lines in their arbitration, will represent the elevated railway employees. Mr. Budd has not selected the company's representative in this arbitration. It is not regarded as likely that the hearings will be held until early in October.

INQUIRY INTO ELEVATED THIRD-TRACKING

The Thompson legislative committee continued on July 30 its inquiry into the work of the Public Service Commission for the First District. It was expected at the session to learn direct from the members of the commission the status of the rapid transit work now under way, but none of the members appeared before the committee. The offer of Travis H. Whitney, secretary of the commission, to testify was rejected. An executive session of the committee was called and it was decided to proceed with the work of looking into the rapid transit situation during the week ended Aug. 7, although the members of the committee had hoped originally to adjourn on July 31 until the fall.

On Aug. 2 Chairman McCall of the commission was questioned more particularly with respect to the third-tracking of the Fulton Street elevated line of the Brooklyn Rapid Transit System, to which objection has been raised by Brooklyn property owners. Mr. McCall objected to elevated structures, but he did not see how the city could afford to spend from \$4,000,000 to \$8,000,000 additional for subways. He said the Fulton Street third-tracking was before the courts, but he did not believe that the courts would decree the third-tracking to be a nuisance.

On Aug. 3 Charles L. Woody of counsel for the Brooklyn Rapid Transit Company said that the consents for the Fulton Street work had been validly and legally procured and that he was willing to lay the consents before the committee. Commissioners Williams and Cram also appeared before the committee on Aug. 3. At the conclusion of the session on that date the committee announced that it had decided to adjourn until Sept. 7.

NEW CLEVELAND GRANTS PROVOKE DISCUSSION

Business men along East Fifty-fifth Street, Cleveland, Ohio, are circulating papers indorsing the electric freight subway that is to be built under that thoroughfare by the Cleveland, Akron & Canton Terminal Railroad. This is an effort to counteract the clamor for a referendum vote on the franchise recently granted the company.

One of the principal objections to the franchise recently granted to the Cleveland & Youngstown Railroad aside from the electrification requirement, which has been promised through an amendment, is the fact that an agreement was not secured from the other railroads to build a union station on the lake front. Councilman Fitzgerald and other minority leaders fear that the New York Central and other large lines will use the station that will eventually be built by the Cleveland & Youngstown Railroad and will refuse to erect the imposing structure on the lake front that the city desires.

H. Holland, manager of the Trolley Supply Company, Cleveland, has suggested that flat, malleable-iron or steel tracks be laid in all the principal streets that have no street cars for vehicular traffic of all kinds. Mr. Holland believes the heavy trucks now in use are very destructive to pavements and that these tracks would cost less than the money required to keep the pavements in proper condition. The tracks should be 15 in. or 16 in. wide, he said, and the rails discarded by the railway company would make a good base for the vehicle tracks. In the wide streets he would have double tracks, and in the narrow thoroughfares a single track would do. Mr. Holland also believes this would keep the vehicles off the streets which have railway tracks and prevent congestion. He conferred recently with Peter Witt, street railway commissioner, in regard to the plan.

The interest fund of the Cleveland Railway on June 30 was \$505,342. It is slowly increasing. When it reaches \$700,000 the 1-cent charge for transfers will be removed. The receipts of the company for June were \$721,115, a gain of \$78,478 over the same month in 1914. The amount received from transfers was \$65,291.

Cut Asked in Franchise Tax.—The trustees of the Rhode Island Company, Providence, R. I., have addressed a letter to the City Council reminding that body of the petition of last May, in which the trustees asked that the city reduce the company's franchise tax.

Hearing of Clay County Suit Postponed.—The motion for rehearing of the suit by the Interstate Railway against the

Kansas City, Clay County & St. Joseph Railway, in which the plaintiff was awarded \$1,500,000 damages, will be heard on Aug. 9 instead of Aug. 2, as first set.

Refund of Excise Tax Ordered.—Judge Dickinson has filed an opinion in the United States District Court at Philadelphia deciding that five subsidiary electric railways operated by the Philadelphia Rapid Transit Company were not carrying on business within the meaning of the excise tax law of 1909 and therefore were not liable to the tax. The government is ordered to refund \$23,913.

Little Rock Honors Judge Kavanaugh.—State, city and county offices and every business house in Little Rock closed on Aug. 4 in memory of the late Judge W. M. Kavanaugh of Little Rock, president of the Little Rock Railway & Electric Company at the time of his death and for fourteen years president of the Southern Baseball Association, for whom Wednesday afternoon was set aside as Kavanaugh Day in the league.

Extension of Detroit Interurban Line Opened.—The 8-mile extension of the Detroit, Almont & Northern Railroad, Detroit, Mich., from Almont to Imlay City will be formally opened on Aug. 20. The new line affords direct connection between Detroit and Imlay City. It will be operated as one of the lines of the Detroit United Railway system. Residents of Imlay City and along the route subscribed funds sufficient to buy the right-of-way and fence it, following the same plan adopted in the extension to Almont fourteen months ago.

Offer to Operate at Cost Plus 10 Per Cent.—Bridge Commissioner Kracke of New York has announced that he is in receipt of an offer from the Third Avenue Railway to operate on the basis of cost of service plus 10 per cent profit, substantially the same local surface car service over the Williamsburg Bridge as that now afforded by the Bridge Operating Company. The contract with the Bridge Operating Company, which is controlled by the Brooklyn Rapid Transit Company and the New York Railways, was entered into by the company and the city in 1905. Mr. Kracke is also in receipt of an offer for service over the Williamsburg Bridge from the Manhattan Bridge Three-Cent Line, which now operates over the Manhattan Bridge.

Franchise Interpretation Requested.—The Gary, Hobart & Eastern Traction Company has asked the City Council of Gary, Ind., to interpret the section of the franchise regarding the entrance of interurban cars into the city over the tracks of the Gary & Interurban Railroad. It is the plan of the interurban line, if the matter of incoming interurban cars can be satisfactorily arranged, to ask for a franchise on Seventh Avenue or Eighth Avenue east to Virginia Street, north to the mill gates and west on Fourth Avenue or Fifth Avenue to Broadway and east on Fifth Avenue to the city limits, thus allowing the Hobart cars to make a loop and carry workmen to the Virginia Street entrance of the mill as well as handling traffic to the towns of Miller and Aetna.

Dr. Wilcox on the Public Service Law.—Dr. Delos F. Wilcox has submitted a statement to the New York legislative committee on investigation of the public service commission law, in which he makes a number of criticisms of the present law as well as a number of suggestions. Among the charges which he brings against the present law is a lack of responsibility of the commissioners to the local authorities in the case of the First District Commission, that the commission has power to enter into contracts with the same companies whose services it is called upon later to regulate, that the telephone and telegraph services in the first district are under the jurisdiction of the commission in the second district, that the public service law in some respects is inconsistent with the present railroad law, that some of the franchises are perpetual while others are limited or indeterminate, and that the commission does not have power to require extensions. He recommends the establishment of one State commission with local municipal commissions with certain powers to control the utilities in the larger cities of the State, and longer tenure of office, but with possibly the power of "recall" in the hands of the people. He also criticises professions on the part of commissioners of belief that the public service corporations are making every effort to serve the public interests.

Financial and Corporate

ANNUAL REPORTS

Philadelphia Rapid Transit Company

The comparative statement of income, profit and loss of the Philadelphia (Pa.) Rapid Transit Company for the years ended June 30, 1914 and 1915, follows:

	1915	1914
Earnings:		
Gross passenger earnings.....	\$22,971,594	\$23,356,876
Receipts from other sources.....	872,011	898,936
Total	\$23,843,605	\$24,255,812
Expenses:		
Maintenance and renewals:		
Maintenance	\$2,435,415	\$2,668,752
Reserve fund for renewals.....	1,141,126	969,620
Total appropriation	\$3,576,541	\$3,638,372
Operation of power plants.....	1,417,239	1,557,965
Operation of cars.....	6,205,100	6,297,115
General	1,329,829	1,527,387
Taxes	1,348,723	1,278,406
Total	\$13,877,432	\$14,299,245
Net earnings from operation.....	\$9,966,173	\$9,956,567
Fixed charges:		
Interest	\$2,259,471	\$2,161,696
Rentals	7,364,997	7,364,635
Sinking fund, city contract.....	120,000	120,000
Total	\$9,744,468	\$9,646,331
Surplus	\$221,705	\$310,236

The gross earnings showed a decrease of \$412,207, or 1.7 per cent for the year, divided 1.65 per cent for passenger earnings and 3 per cent for other receipts. This is accounted for by the continuance of the general industrial depression experienced during the preceding fiscal year, which was aggravated by the further unsettling of business conditions occasioned by the outbreak of the European war in August, 1914, and also by the jitney competition commencing in the spring of 1915.

Although the taxes increased by \$70,317, the total operating expenses decreased \$421,813. This saving was accomplished by making all operating economies possible without impairing the standard of service. The operating ratio for the year was 58.2 per cent.

The fixed charges showed an increase of \$98,137 on account of added interest charges. The resultant surplus for the year ended June 30, 1915, was \$221,704, as compared to \$310,236 for the preceding year, a decrease of \$88,531.

The capital asset account "Leases, Franchises, Construction, Equipment, Advances to Leased Lines, Sinking Funds, etc.," as of June 30, 1915, amounted to \$113,010,043, representing a decrease of \$688,381 during the year. Charges for additions and betterments during the year amounted to \$329,566.

The renewal reserve amounted to \$1,269,036, as of June 30, 1915, as compared to \$1,042,962 at the beginning of the year, the increase being occasioned by the appropriation from income for renewals exceeding the expenditures during the current year. This balance of \$1,269,036 to the credit of the renewal reserve represents the accumulated total of amounts charged to operating expenses to provide for renewals in excess of the actual expenditures for renewals during the five years to June 30, 1915. The renewal fund as of June 30, 1915, amounted to \$1,250,000, of which \$128,246 was in cash. This renewal fund is held against the renewal reserve for the purpose of financing the expenditures for renewals when they may be incurred in the future.

The company's equipment trusts, Series B and C, dated March 1 and May 1, 1913, respectively, provided for a total issue of \$6,144,000 of 5 per cent car trust certificates maturing in equal semi-annual instalments during a twelve-year period from 1913 to 1925. A total of \$1,024,000 of these certificates has been retired during the two years ended June 30, 1915.

The accident reserve amounted to \$1,042,555 as of June 30, 1915, as compared to \$1,110,703 at the beginning of the year, the decrease being caused by the settlement of cases pending at the first of the year. The total suits pending

were reduced from 2529 to 2167 during the year. The records for the four year period ended June 30, 1915, show a reduction of suits pending from 4367 to 2167, a decrease of more than 50 per cent, whereas the accident reserve during the same four years was reduced only about 20 per cent, or from \$1,311,996 to \$1,042,555.

Washington Railway & Electric Company

Net earnings of \$1,103,942 for the first six months of 1915 are shown in the semi-annual report of the Washington Railway & Electric Company, Washington, D. C. The gross earnings during these six months were \$2,601,738, as compared with \$2,527,747 during the first six months of 1914. A comparative statement of earnings and expenses follows:

	1915	1914
Gross earnings	\$2,601,738	\$2,527,747
Operating expenses and taxes.....	1,454,263	1,394,665
Depreciation of equipment.....	\$1,147,475	\$1,133,082
Net earnings	43,532	30,000
Miscellaneous income and profit and loss items	\$1,103,942	\$1,103,082
Fixed charges	37,524	12,257
Net income	\$1,141,466	\$1,115,338
Dividends (preferred and common).....	593,212	578,059
Balance	\$548,254	\$537,279
Sinking fund	440,000	440,000
Surplus	\$108,254	\$97,279
	52,700	49,160
	\$55,554	\$48,119

Announcement has been made of the resignation of William B. Hibbs from the directorates of all public utility corporations the securities of which he handles in the capacity of a broker. They include the directorates of the Washington Railway & Electric Company and its subsidiary companies. Mr. Hibbs' resignation was prompted by ethical reasons. As a broker he was called upon to buy and sell securities of the several companies of which he was a director, and he was often placed in embarrassing positions. Under the circumstances he felt that it would be better for him to withdraw from the directorates.

Lima Light, Power & Tramways Company

The Empresas Electricas Asociadas (Lima Light, Power & Tramways Company), which holds practically a monopoly of the electric railway, power and light service in Lima, Callao and several of the suburban towns around these cities in Peru, secured revenues from its various branches during 1914 amounting to \$1,913,368, as compared to \$1,981,560 in 1913, a reduction of \$68,092. Gross expenditures were \$1,328,223 in 1914 and \$1,420,594 in 1913, representing an economy of \$92,371. In view of the fact that these results were obtained during the most abnormal year in the history of the company, and the net receipts were the largest yet obtained, the year's results were considered highly satisfactory. The two principal factors affecting the revenues were the disturbed political situation during the first half of 1914 and the consequences of the European war during the second half.

The gross receipts of the urban and interurban tramways amounted during 1914 to \$997,719, a decrease of \$45,511 in comparison with 1913. The gross receipts of the Lima urban tramways were \$457,533, or \$18,560 less than the preceding year. This section was augmented during the year by twelve new American-built cars of the latest type. There was a reduction in the revenues of the Lima-Cherrillas tramway of \$11,689, the gross revenues of the year being \$280,616. The branch from Lima to Callao also suffered decreased revenues to the amount of \$17,465 in comparison with 1913. This was caused by the suspension of maritime traffic and the limitation of business in Callao. The Magdalena Interurban Tramway was the only one that showed an increase in gross receipts, which were \$35,271 in 1913 and \$37,481 in 1914. The number of passengers transported on all the tramway lines fell from 29,020,888 in 1913 to 28,120,425 for 1914. A dividend of 1 per cent was distributed during 1914 in accordance with an agreement entered into with the bondholders.

NEW KANSAS CITY PLAN PRESENTED

Judge W. C. Hook of the United States District Court of Kansas City, Mo., on July 29 in Chicago presented suggestions relative to a reorganization plan for the Kansas City Railway & Light Company. The plan of Judge Hook is now being circulated for signatures among the various security committees, and a few details still to be settled are under discussion. The plan is said to be satisfactory to the city officials, and according to City Counsellor Evans it meets the terms of present franchises and the pending ordinance. Attorneys for the Metropolitan Street Railway are now working on the plan and a new franchise, which will be taken up later by the city.

Judge Hook's plan involves the complete exchange of old securities and the separation of the railway and the light properties. In outline it provides for an indebtedness allowance of \$28,700,000 for the present companies, which is to be borne by two new companies, one representing the railway and the other the lighting interests. This indebtedness includes some underlying liens and some collateral liens of the holding company.

It was decided by Judge Hook that approximately \$5,000,000 of the indebtedness allowed should be borne by the new light company. This would be divided about three-fifths in first mortgage bonds and about two-fifths in second mortgage bonds. The railway company should issue approximately \$8,000,000 of 5½ per cent three-year notes; an open first mortgage, of which \$10,000,000 of first mortgage 5 per cent bonds, for purposes of the plan, should be issued, and \$5,700,000 of second mortgage bonds. The holders of the present securities would be expected to accept the new securities at par and maintain as far as possible the existing liens. There would be issued \$1,000,000 of bonds for immediate capital expenditures on the railway. All of the bonds would mature in 1944, but a sinking fund has been provided in the case of the second mortgage, which would retire all of that issue before maturity.

The plan provides for a board of readjustment managers, composed of Kuhn, Loeb & Company, Blair & Company, Lee, Higginson & Company and H. L. Stuart, the latter acting in an individual capacity for Judge Hook.

SIX PER CENT RATE FOR BOSTON

In reference to the quarterly dividend of 1½ per cent on the stock of the Boston Elevated Railway, payable on Aug. 16, as announced in the *ELECTRIC RAILWAY JOURNAL* of July 31, the directors issued the following statement:

"Although we do not know whether the earnings for the year ending June 30, 1916, will be sufficient to pay four quarterly dividends of 1½ per cent each, the directors have not deemed it just to reduce the established rate, as there is a chance that 6 per cent may be earned. An estimate has been prepared by the treasurer of the probable net earnings for the current year, which shows about 5½ per cent. This is upon the basis that no additional requirements for depreciation shall be imposed upon the company.

"The 6 per cent rate is only about 5 1/3 per cent on the money actually paid in to the corporation by its stockholders, and is less than a reasonable return on the actual investment. Further, the ability of the company to earn and pay at least 6 per cent, with a sufficient margin for depreciation and contingencies, is necessary in order to maintain the credit of the company so that it can obtain from time to time additional capital for the extensions to its service which the public desires.

"The net income of the company has been seriously affected by the large increase in the cost of labor and materials and by the large burdens which have been constantly imposed upon the company, and in the judgment of the directors, it is not likely to be sufficient to provide for continuous 6 per cent dividends, unless some relief is had either by an increase in the unit of fare or otherwise."

Boise (Idaho) Railroad.—It is expected that the old Boise (Idaho) Railroad will soon be segregated from the Idaho Traction Company and that the line and all its equipment will be turned back to E. H. Jennings and his associates, the former owners. The line was sold three years ago, when the three city lines in Boise were consolidated. The old owners have asked the directors to return the property and resign as agreed in the foreclosure case of the other

properties of the Idaho Railway, Light & Power Company recently decided in the federal court, as noted in the *ELECTRIC RAILWAY JOURNAL* of May 8. Two eastern directors have already resigned, and the local directors are expected soon to follow suit. It is understood that H. E. Dalton, who formerly managed the Boise & Interurban Railway, which was financed by Mr. Jennings, will take charge of the Boise Railroad. This railway consisted of the line running from the Natatorium to Main and Thirteenth Streets, thence north of Thirteenth Street to Eastman Street, west on Eastman Street to Eighteenth Street and north on Eighteenth Street to Irene Street. The lines on Eastman and Eighteenth Streets were taken up when the property was acquired by the Idaho Traction Company. The company also owned the line on North Eighth Street as far as Eastman Street, which portion is now used as a part of the city belt line. The South Eighth Street line, which operated into the Riverside Park district and a portion of which was taken up, was also owned by the old company. This is now used for the Cole school car and a portion of it for the interurban cars running to Nampa. Just what the new company will do in connecting up its lines after the transfer is made is not known, but looking toward that end it has connected the loop line at Eighteenth and Bannock Streets and put in additional switches.

Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont.—An announcement will be made to the Canadian Stock Exchange and also in London, England, that the directors of the Brazilian Traction, Light & Power Company, Ltd., have decided upon a 2 per cent reduction in the company's dividend. This action is taken in view of the unsettled conditions surrounding exchange in Brazil and the prolongation of the war. A dividend of one-half of 1 per cent has been announced, payable on Sept. 1, 1915. As the 4 per cent dividend applies for the year 1915, and two quarterly disbursements of 1½ per cent each have already been made this year, shareholders on the present basis should receive another 1 per cent in dividends divided into the two last quarterly payments. The new arrangement is expected to meet with the entire commendation of conservative financiers. The reduction is made in the face of steady increases in net earnings almost month by month for the nine months' war period from September, 1914, to May, 1915, inclusive. The increase in earnings are the more interesting because the general impression prevails that conditions in Brazil are bad.

Chicago (Ill.) Railways.—The directors of the Chicago Railways have declared a dividend of \$4 on the Series 1 participating certificates, payable on Sept. 1 as of Aug. 1 to holders of record of May 20. The last distribution on the Series 1 certificates was \$4 last June, the payment due on Feb. 1, 1915, having been deferred until that time.

Chicago (Ill.) Surface Lines.—The Illinois Public Utilities Commission has authorized the Chicago City Railway to issue first mortgage 5 per cent gold bonds amounting to \$2,242,000, the Calumet & South Chicago Railway to issue first mortgage 5 per cent gold bonds amounting to \$500,000 and the Chicago Railways to issue similar bonds for \$2,726,000. These issues are to cover contemplated capital expenditures for 1915 and are provided for in the 1907 settlement ordinances. Whether they will all be sold at one time or in amounts as funds are required depends upon the condition of the bond market. This item supersedes a notice in the *ELECTRIC RAILWAY JOURNAL* of July 24.

Denver (Col.) City Tramway.—The dispute between the city of Denver and the Denver City Tramway over the tax rate for 1912, 1913 and 1914 has been compromised through the payment by the company of \$378,061 to cover the balance of taxes in 1912 and all of the 1913 and 1914 taxes in question. Under the assessed valuation made by the State Tax Commission the taxes for the three years amounted to \$579,273, including interest and penalties up to July 1. The compromise figures, therefore, show a reduction of about \$200,000. Under the terms of the settlement the company gave a bond to the city and county of Denver covering any claims the State may make for its proportion of the taxes as assessed by the State commission. It is not expected that this figure will be more than \$25,000, even if the State is successful in its claim. Following the payment of taxes the city dismissed the suit for receivership which was started on account of the non-payment of taxes.

Glendale & Montrose Railway, Los Angeles, Cal.—The California Railroad Commission has authorized the Glendale & Montrose Railway to issue 400 shares of stock, par value \$100, to J. Frank Walters for the purpose of reimbursing him for capital expenditures made in behalf of the company. A change in the company's articles of incorporation must be made to provide for this issue. The application for this issue was noted in the *ELECTRIC RAILWAY JOURNAL* of Feb. 20.

Newark & Marion Railway, Newark, N. Y.—The sale of the Newark & Marion Railway, which was advertised for July 20, has been postponed until Aug. 26. This line, which runs from Newark to Marion, a distance of 10 miles, is temporarily operated by steam. Harold C. Beatty is the receiver.

New York (N. Y.) Railways.—The Public Service Commission for the First District of New York on July 27 denied the application of the New York Railways, intervenor, for a modification of the commission's order of Dec. 10, 1912, ordering the company to set aside for depreciation each month an amount equal to 20 per cent of its gross operating revenue. This action was taken without prejudice, however, to the right of the company to renew its application after the courts have decided the certiorari proceedings brought to review orders made by the commission in the Metropolitan reorganization cases. The company desired the commission to modify its order so that 20 per cent of the gross passenger revenue would be set aside for depreciation instead of 20 per cent of the gross operating revenue. In conformity with the order the company had set aside the required amount from Jan. 1, 1912, to Oct. 31, 1914, totalling \$7,868,008. During this time the company spent for maintenance \$6,224,140, leaving a balance in the reserve of \$1,623,867. An amount representing 20 per cent of the gross passenger revenue would have accumulated \$1,348,867, which the company asserts would be ample for all depreciation accrued during the period in question.

Northern Ohio Traction & Light Company, Akron, Ohio.—The Ohio Public Utilities Commission has authorized the Northern Ohio Traction & Light Company to issue \$500,000 of one to five-year 6 per cent collateral trust notes, maturing in five equal installments beginning with July 1, 1915, and ending with July 1, 1920. The notes are secured by an assignment to the trustee of the bonds deposited under the \$1,500,000 collateral trust issue of Aug. 1, 1913, subject to the terms of the indenture securing the latter issue. The bonds when released from that issue will be automatically turned over to the trustee for the security of the new issue. The proceeds are to be used to reimburse the company's treasury for money previously expended from income or to pay obligations for construction work, amounting to \$209,421, and to reimburse the treasury for \$300,000 expended from income for the redemption of matured collateral trust notes used for construction purposes. The provisional sale of these notes to Hayden, Miller Company, Cleveland, pending the authorization by the commission, was noted in the *ELECTRIC RAILWAY JOURNAL* of June 12.

Public Service Corporation, Newark, N. J.—The directors of the Public Service Corporation of New Jersey have decided to issue monthly financial statements for the information of the general public, instead of the one customary statement preceding the stockholders' annual meeting. The first statement issued in accordance with the new policy is for the first six months of this year. Future statements will cover monthly operations as well as the operation for the proportion of the year up to the date of the report. The report now issued states that even with the unsettled conditions of the last six months the corporation shows a gain in gross earnings over the first half of 1914 amounting to \$631,836, or an increase of 3.6 per cent. The balance available—after the payment of operating expenses, fixed charges, sinking fund requirements, etc.—for amortization, dividends and surplus amounted to \$1,597,442. This means that the increase in surplus available for dividends over the corresponding period of 1914 was \$149,596.

Rhode Island Company, Providence, R. I.—Judge Arthur L. Brown of the United States District Court has handed down a decision against George W. Sabre upholding the

legality of the long series of transactions by which the ownership of the Rhode Island Company was brought to its present basis. Mr. Sabre has fought the case since 1902, asserting that the United Traction & Electric Company acted beyond its power in voting in favor of leasing the local street railway to the Rhode Island Company for a period of 999 years. The court held that, however just the criticisms made of the financing disclosed and of the mingling of business and speculation might be, the plaintiff had failed to show that the traction company had exceeded its powers or abused his rights as a minority stockholder.

Winnipeg, Selkirk & Lake Winnipeg Railway, Winnipeg, Man.—The Manitoba Public Utilities Commission has authorized the Winnipeg, Selkirk & Lake Winnipeg Railway to issue \$1,400,000 of first mortgage bonds. The proceeds of this issue are to be used for the purpose of putting the interurban line and the Winnipeg Electric Railway on separate footings. The interurban line owes the Winnipeg Electric Railway \$940,000 for money advanced for construction and equipment purposes, and the sale of the bonds will enable it to satisfy this claim. The bonds are to be sold for not less than 85 when approved by the stockholders.

DIVIDENDS DECLARED

Boston (Mass.) Elevated Railway, quarterly, 1½ per cent.
Brazilian Traction, Light & Power Company, Toronto, Ont., quarterly, one-half of 1 per cent.

Chicago (Ill.) Railways, 4 per cent, participating certificates, Series 1.

Citizens Traction Company, Oil City, Pa., 75 cents, preferred.

Ohio Traction Company, Cincinnati, Ohio, quarterly, 1¼ per cent, preferred.

Union Street Railway, New Bedford, Mass., quarterly, 2 per cent.

JITNEY JOTTINGS

Jitney Seen as a Picturesque Industry Defying Laws of Investment and Production

In commenting editorially on the refusal of the Public Service Commission of Indiana to assume jurisdiction over the jitneys, the Indianapolis *Star* said in its issue of July 30 under the caption "There is Reason in All Things":

"It is unfortunate for more than one reason that the Public Service Commission finds itself unable to take cognizance of the jitney complication in the street car situation. No one would wish to visit any needless hardship on this new and picturesque industry which cheerfully offers to defy all laws of investment and production; but if government is to be fair and just, it must sooner or later take account of losses sustained by public utilities as well as their profits.

"It is all very fine for the authorities of various powers and prerogatives to say that the street car company is making money and must raise wages all around and reduce fares and pay more taxes and build more extensions wherever real estate operators want them and pave 100 miles of track and take whatever the State or the Mayor or the Council or the Chamber of Commerce hands it and like it. But how about when things are going the other way? Does the State propose to go on indefinitely reducing the company's income and increasing its outgo and then when it asks for relief find that nothing can be done? The jitney incident is a small matter, of course; but there ought to be some sense of justice in the public mind toward these utilities in which so many of our citizens have invested their savings and upon whose ability to show earnings depend the quality and quantity of this indispensable public service."

Following the submission to the City Commissioners of Dallas, Tex., of an ordinance regulating the jitneys prepared by the jitney men with a petition for an election signed by 4500 voters, a compromise was made and an ordinance agreed upon by both parties containing features of both previous ordinances to become effective within the next ten days. The license fee under the new ordinance remains at \$75, but \$65 of this amount is for the regular operator and \$10 for a substitute. The principal changes from the city's original law is the privilege to secure permission from the city automobile inspector to make special trips. Operators must live in Dallas sixty days before being granted a license instead of six months as formerly. Licenses may be taken out for a period of six months instead of one year. Not more than one-fourth of all the cars operated on one route may be taken off at one time; the section of the first measure requiring lights in the tonneau and the use of non-skid tires is eliminated. Otherwise the ordinance is similar to the original one, limiting the number of passengers, requiring inspection of cars and examination of drivers and barring smoking. The ordinance is said to be more liberal than any of the fifty passed in various cities and examined in Dallas.

Justice McBride in the Supreme Court at Salem, Ore., rendered an opinion on July 27 to the effect that the city of Portland must show that the local jitney ordinance was passed by the City Council before being approved by the voters. The decision is regarded as a purely technical one growing out of a multiplicity of petitions, plans for referendums, re-enactments, etc., and the court has declared that the city has a legal right to enact a regulatory ordinance. The opinion reverses the decision of Circuit Judge Gantenbein, sustaining the demurrer of H. R. Albee, Mayor and defendant, and the case is remanded with directions to the Circuit Court to permit an answer to be filed within a reasonable time.

One jitney ordinance, to embrace the features of the two that had been originally drafted for passage in the Board of Works and the Common Council of Newark, N. J., respectively, has been decided upon by the finance committee of the Council and the committee appointed by the Board of Works, headed by City Counsel Frazer, to provide regulations for the buses and their drivers. The ordinance provides for license fees ranging from \$50 for a car carrying

five passengers or less up to \$100 for cars carrying more than sixteen passengers. The substitute measure also includes the regulations relating to overcrowding of cars, schedules, routes and other points that up to this time were contained in the ordinance that was to have been acted upon by the Board of Works.

The Wisconsin Assembly has concurred in the Senate bill providing for State regulation of jitney buses by the State Railroad Commission. The bill now awaits Governor Philipps' approval. The measure declares jitneys to be common carriers and provides that they shall not be operated except by permit issued by the State Railroad Commission. A jitney owner is required to file with his application for a permit a bond, to be conditioned on the payment of damages for personal injuries or death in a sum not to exceed \$5,000 to any one person or \$10,000 for any accident caused by negligent use or operation. The Railroad Commission is to determine whether the rate is reasonable.

In the *ELECTRIC RAILWAY JOURNAL* of July 31, page 207, a statement was quoted from the Baltimore *Sun* to the effect that the Baltimore Transit Company, in which the United Railways & Electric Company is interested, was having a score or more of buses made for it. The Baltimore Transit Company has in service fifteen auto buses and has placed an order for five additional cars. The bodies are being built by The J. G. Brill Company and the chassis by the Garford Company.

The Police Commission of Los Angeles, Cal., has notified the Pacific Coast Casualty Company, which is soliciting business from jitney bus drivers, that it must submit a new form of bond, to be approved by the city attorney and the commission. The commission limited the amount which the company may accept to \$220,000, the equivalent of the bonds for eleven jitneys at \$11,000 each. This is a severe setback for the promoters of the jitney men's association, who have been waging a campaign for increased membership on the basis of some kind of a special deal with the casualty company through which members of the association secure their bonds at a reduced rate. The new bond must be presented to the commission by Sept. 30. The Employers' Indemnity Exchange is also soliciting jitney bond business.

The fight between the jitney operators and the Youngstown Park & Falls Railway, Youngstown, Ohio, continues. On July 26 the Jitney Bus Association filed warrants for the arrest of seven employees of Idora Park, owned by the railway company, for violation of Sunday laws. This was in retaliation for the admission charge to the park made to all persons who do not go there on the street cars. On July 22 the company brought suit against Justice of the Peace T. J. Skipp and ten jitney operators for \$30,000 damages. The petition charges illegal arrest of several of its park employees for violation of the Sunday labor laws. In order to keep the affairs of the park and the railroad separate, the Idora Park Company has been incorporated with a capital stock of \$10,000 by R. P. Stevens, E. G. Dunlap, John T. Harrington, Fred J. Hein and Richard Wilson. The park has always been operated separately from the railroad, although owned by it, but the incorporation of a company to own and operate it will result in an entire separation of their affairs. Messrs. Stevens and Dunlap are officials of the railway.

An ordinance has been introduced into the City Council of Springfield, Ill., for the regulation of jitney buses. It provides for the operation of jitneys for eight consecutive hours daily, with certain terminals, the filing of a bond to be approved by the City Council, which is to have power to revoke all licenses upon infringements of the ordinance.

Regarding the jitney situation in Philadelphia the *Ledger* said in its issue of July 29:

"War between the rival associations of jitney men has had the effect of forcing scores of drivers out of both organizations and throwing the business back to where it was when the jitneys started in this city. It seems as if the predictions of those who had observed the rise and fall of the jitneys in Western cities are to be borne out here. Yesterday some of the local jitney men themselves admitted that they could not afford to do business at the 5-cent rate, except on Sundays and holidays when they were busy all the time. It is the opinion of many of the jitney men themselves that next winter will see the end of about half the

business in this city, and that the resumption of the business next spring will bring out only a small fraction of the present number of jitneys. Therefore they are not worrying about court action on the jitney regulating ordinance. Having forestalled it until Sept. 20, they are now prepared to let it go by default and regard with unconcern any further action City Councils may take, going out of business rather than submit to strict regulation."

NIAGARA FALLS WRECK INQUIRY

One hundred and seventy-three passengers, not including a number of children under five years old, were aboard the car of the International Railway when it was wrecked on the grade near Queenstown, Ont., four weeks ago.

Among those at the inquest at Queenstown on July 28 were N. F. Davidson, K.C., of Toronto, Ont., who conducted the session, representing the attorney general of the province of Ontario, Canada; A. Monroe Grier, K.C., Toronto, and Alexander Fraser, K.C., Niagara Falls, Ont., who have been retained as special counsel of the International Railway; T. Herbert Lennox, Toronto, representing the street car union; County Crown Attorney Brennan of Lincoln County; High Constable Boyle of the provincial police; F. Armour, K.C., of the Canada Steamship Lines, Ltd., and counsel representing the St. John's and Woodgreen Methodist churches, of which the excursionists were members.

The superintendent of the International Railway in company with Vice-President Dickson and General Counsel Penney, made a minute inspection of the rails and roadbed on the steep grade where the disaster occurred and they declared everything was found to be in good condition. The motorman of the car testified at the inquest that weeds had grown over the rails, thus adding to the slippery condition of the tracks caused by the rain. As the result of the wreck, orders have been issued by the Ontario Railway Board that there is to be no overcrowding of electric railway cars in the province.

Mr. Dickson was arraigned by the Canadian police on Aug. 5 charged with criminal negligence resulting in death in connection with the Queenstown Heights disaster. He was released in \$20,000 bail. The hearing will be held on Sept. 1.

GROUP INSURANCE OFFER IN BROOKLYN

Outline of Liberal Insurance Terms Secured for Brooklyn Employees

The Brooklyn (N. Y.) Rapid Transit Company has entered into an arrangement with the Travelers Insurance Company, Hartford, Conn., whereby that company will insure the lives of the employees of the transit system who wish to take advantage of the opportunity under the so-called "group" plan. The offer is extended to all employees who have been in active service for two years or more. Those eligible number more than 8000. The company will pay one-half of the annual premium on insurance up to \$1,000, and in certain cases will pay the entire premium. Any employee, if he chooses, may take insurance up to \$5,000, subject to the approval of the insurance company as to his physical condition. If at least 5000 employees take advantage of the opportunity no medical examination will be required. If at least 1000 come into the group, and less than 5000, a medical certificate from the Brooklyn Rapid Transit Company physicians will be required. Assuming that all the employees who are eligible to the insurance join the group and take the minimum amount, namely \$1,000, the total insurance will be upward of \$8,000,000.

The policy is the so-called "term" insurance, namely, insurance taken for one year but renewable from year to year indefinitely. The rate differs with the age of the employee, and the annual premium, which will be paid in the first place by the Brooklyn Rapid Transit Company, is believed to be the lowest at which such insurance has ever been written. For the employees it will mean that those under thirty-two years of age will have their lives insured for \$1,000 upon the payment of about 7 cents a week; employees more than thirty-two and less than forty about 8 cents a week, and so on, gradually increasing as the age of the insured employee increases. The company has agreed to assume the entire premium in the following cases and under the following conditions:

(a) In the case of employees who, after taking out this insurance, may thereafter be retired under pension pursuant to the rules and regulations of the pension bureau.

(b) In the case of employees, who, taking out this insurance and having served at least ten years with the company, are obliged by reason of partial disability not due to accident in the service of the company to accept with the company employment materially reducing their earning capacity from what had been their average annual earnings for the ten years last preceding such change of position.

(c) In other special cases calling for particular consideration.

The company states that in making this offer it desires to reward continuous and faithful service, and by assuming the entire premium in such cases will in effect be furnishing such employees with a paid-up policy for \$1,000 at a time of life when the payment of an insurance premium might be a burden. Employees have the option of discontinuing the insurance after the expiration of any year.

Special privileges have been obtained from the insurance company, whereby any employees not remaining in the service of the transit company, may, within a limited time after leaving such service, take one of the regular life or endowment policies of the insurance company as of the age at which he entered the insurance group by paying the difference in premiums applicable to the different kinds of policies. The insurance policy contains also provision for total and permanent disability, whereby before death the amount of the policy will be paid in installments.

New Louisiana Line Completed.—The construction of the Orleans-Kenner Electric Railway has been completed between New Orleans and Kenner, and it is expected to establish service between those places soon.

New Limited Car Placed in Service.—The Indianapolis, Columbus & Southern Traction Company, Columbus, Ind., has placed in service a new limited car between Indianapolis and Columbus, Ind., to be known as the Columbus Limited.

Near-Side Stop Established in Texarkana.—The city lines of the Southwestern Gas & Electric Company in Texarkana, Tex., have established the near-side-stop practice in order to comply with an ordinance recently passed by the West Side City Council.

Decrease of 25 Per Cent in Accidents.—The Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., reports that accidents have decreased 25 per cent during the last two years while the company has been active in its safety-first campaign.

Permission to Reduce Wages Asked.—The British Columbia Electric Railway, Vancouver, B. C., has requested of the arbitration board of Vancouver the privilege of reducing the existing wage scale for employees by 15 per cent. The financial and business depression, the general reduction in wages in practically all industries, and an alleged drop in the cost of living since 1913, are cited as reasons for making the request.

Plans for Skip-Stop in Milwaukee.—The members of the Railroad Commission of Wisconsin, City Attorney Hoan of Milwaukee and the officers of The Milwaukee Electric Railway & Light Company have reached an agreement under which the skip-stop plan will be tried for three months on the Wells-Farwell, the Greenfield Avenue and the Walnut Street lines of the company. A vote of the passengers will then be taken and it is stated that the commission will be governed regarding its permanent order by the sentiment expressed by riders at the conclusion of the experimental period.

Massachusetts Northeastern Wages Adjusted.—The members of the local union of employees of the Massachusetts Northeastern Street Railway, Haverhill, Mass., have voted to accept the final offer of the company, which grants an increased wage scale, with a maximum increase of 2 cents an hour to 28½ cents, to be reached in the sixth year instead of the eighth, as formerly, and readjusts hours and other working conditions. The union first demanded 30 cents an hour as a minimum wage and 35 cents as the maximum rate, the same as was made by the employees of the Bay State Street Railway.

Personal Mention

Mr. J. H. Larmonth has resigned as superintendent of the Edmonton (Alta.) Radial Railway.

Mr. A. W. Richardson has been appointed trainmaster of the City Light & Traction Company, Sedalia, Mo.

Mr. Moritz Rosen has succeeded Mr. George W. Bacon as vice-president of the United Railways Investment Company, New York, N. Y.

Mr. M. R. Botkin has been appointed roadmaster of the Denver & Inter-Mountain Railroad, Denver, Col., to succeed Mr. O. C. Harrington.

Mr. I. N. Randall has been appointed assistant to the general manager of the Ocean Shore Railroad, San Francisco, Cal., to succeed Mr. F. S. Brooks.

Mr. Norman Coryell has been appointed master mechanic of the Moncton Tramways, Electricity & Gas Company, Ltd., succeeding Mr. R. A. McCharles.

Mr. H. A. MacLean has been appointed accountant of the Moose Jaw (Sask.) Electric Railway, vice Captain C. E. McGee, who was killed in action on May 24.

Mr. Guy E. Tripp, formerly president of the West Penn Traction Company, Pittsburgh, Pa., has been elected chairman of the board of directors of the company.

Mr. George S. Skeen has been appointed superintendent of transportation of the San Diego & South Eastern Railway, San Diego, Cal., to succeed Mr. R. Craig.

Mr. W. M. Barnum, New York, has been elected a vice-president of the Pacific Coast Railway, San Luis Obispo, Cal., to succeed Mr. G. H. Higbee, San Francisco, Cal.

Mr. Roy Chambers of the inspection staff of the Springfield (Mass.) Street Railway, has been appointed superintendent of the Westfield Division, succeeding Mr. V. F. Fabian.

Mr. R. Niver, who has been connected with the power department of the City Light & Traction Company, Sedalia, Mo., has been appointed superintendent of the traction department of the company.

Mr. Francis Blossom of Sanderson & Porter, New York, N. Y., has been elected vice-president of the Trinidad Electric Transmission, Railway & Gas Company, Trinidad, Col., to succeed Mr. L. C. Gerry.

Mr. Oscar Kellogg, who has been publicity man for the East St. Louis & Suburban Railway, East St. Louis, Ill., for the last year, has resigned to accept a position in a similar capacity in Philadelphia.

Mr. George B. Williams, superintendent of the Lansford Division of the Eastern Pennsylvania Railways, Pottsville, Pa., has been appointed general superintendent of the company to succeed Mr. C. F. Crane.

Mr. J. W. Crosby, secretary, treasurer and auditor of the Ocean Shore Railroad, San Francisco, Cal., has, in addition to his present offices, succeeded Mr. F. S. Brooks as purchasing agent of the company.

Captain N. C. Pilcher, general manager of the Sherbrooke Railway & Power Company, Sherbrooke, Que., is in the Fifth Mounted Rifles and is going to the front with the Canadian overseas expeditionary forces.

Mr. F. A. Miller, superintendent of power and equipment and master mechanic of the Oakland, Antioch & Eastern Railway, Oakland, Cal., has succeeded Mr. C. M. Mardel as chief engineer of the company.

Mr. B. A. Duncan, superintendent of the traction department of the City Light & Traction Company, Sedalia, Mo., has been appointed general manager of the Cumberland & Westernport Electric Railway, Cumberland, Md.

Mr. J. J. Callaghan, heretofore superintendent of transportation of the Montreal & Southern Counties Railway, Montreal, Que., has been appointed manager of operation of the London & Port Stanley Railway, London, Ont.

Mr. C. A. Vermillion, superintendent of car service and telegraph of the Spokane, Portland & Seattle Railroad, has had his jurisdiction extended to include the Spokane & Inland Empire Railroad and the Great Northern Pacific Steamship Company.

Mr. J. W. Hale, formerly with the United Railroads, San Francisco, Cal., has been appointed manager and purchasing agent of the Humboldt (Cal.) Transit Company, to succeed Mr. F. C. Morrison, who resigned some time ago on account of ill health.

Mr. Albert Haines, vice-president of the Burlington County Transit Company, Mount Holly, N. J., has been elected president of the company to succeed Mr. I. Snowden Haines. Mr. John D. Johnson, Jr., succeeds Mr. Albert Haines as vice-president.

Mr. Samuel Insull, a director of the West Penn Traction Company, Pittsburgh, Pa., president of the Commonwealth Edison Company, Chicago, Ill., and well known in the central station field, has been elected president of the company to succeed Mr. Guy E. Tripp, who is now chairman of the board.

Mr. O. O. Henson, master mechanic of the Gadsden, Bellevue & Lookout Mountain Railway, Gadsden, Ala., has in addition been appointed superintendent and electrical engineer of the company. The position of superintendent with the company is a new one. Mr. Henson succeeds Mr. H. W. Foote as electrical engineer.

Mr. A. J. Mitchell, comptroller for Mackenzie, Mann & Company, and assistant to the vice-president of the Canadian Northern Railway, Toronto, Ont., has been elected vice-president of the Chatham, Wallaceburg & Lake Erie Railway, succeeding Mr. J. D. Morton, assistant comptroller of the Canadian Northern Railway, Toronto.

Mr. Charles A. Barton, master mechanic of the Rio de Janeiro Tramway, Light & Power Company, Rio de Janeiro, Brazil, has been appointed superintendent of equipment of the company. Mr. Barton has been with the company eight years. He was formerly superintendent of equipment of the Worcester (Mass.) Consolidated Street Railway.

Mr. W. M. Whitenton, formerly general manager of the first district of the Chicago, Rock Island & Pacific Railway, and later with the Chicago electrification committee, has been appointed operating assistant of the Texas & Pacific Railway, reporting to the general superintendent and first vice-president, with headquarters in the city of New Orleans.

Mr. V. F. Fabian, superintendent of the Westfield (Mass.) Division of the Springfield Street Railway, has been appointed superintendent of transportation for the system, with headquarters at Springfield. Mr. Fabian has been in the company's service at Westfield for the last five years, and had previous railroad experience in clerical, dispatching and power station work on the lines controlled by the New England Investment & Security Company. He was at one time engaged in steam railroad work in the West.

Dr. A. S. McAllister, editor of the *Electrical World*, has just resigned and will be succeeded by Mr. F. M. Feiker. Dr. McAllister had been connected with the *Electrical World* since 1905 and had been editor-in-chief during the last two years. He will continue as consulting editor of the paper. At a farewell luncheon extended to him at the Engineers' Club on Aug. 6 by his former associates with the McGraw Publishing Company, Inc., Dr. McAllister was presented with a gold watch from the staff of the *Electrical World*. Dr. McAllister was graduated from Pennsylvania State College in 1894 and received the degree of doctor of philosophy from Cornell University in 1905.

Mr. C. F. Crane, superintendent of railways of the Eastern Pennsylvania Railways, Pottsville, Pa., has been appointed superintendent of transportation of the Wilkes-Barre (Pa.) Railway. Mr. Crane became connected with the Eastern Pennsylvania Railways in 1907 as general passenger agent. In January, 1911, he was appointed superintendent of railways of the company. Before becoming connected with the Eastern Pennsylvania Railways Mr. Crane was passenger and freight agent of the Rochester & Eastern Rapid Railway. The employees of the Eastern Pennsylvania Railways presented a gold watch to Mr. Crane as a token of their confidence and esteem for him.

Mr. Byron T. Burt, who was recently appointed vice-president of the Rutland Railway, Light & Power Company, has also been appointed general manager of this company,

the Western Vermont Power & Light Company and Pittsford Power Company, to succeed Mr. I. M. Frost, resigned. Mr. Burt was formerly manager of the Chattanooga Electric Company until its consolidation with the Chattanooga Railway & Light Company. When the Chattanooga & Tennessee River Power Company was organized to construct the hydroelectric plant at Hale's Bar on the Tennessee River he was made general manager of the company. He later resigned that position to become vice-president of the Rutland Railway, Light & Power Company.

Mr. W. E. Moore, vice-president and general manager of the West Penn Traction Company properties, has resigned his position with the various companies to go into business under his own name as consulting engineer, opening an office in Pittsburgh. Mr. Moore has been with the West Penn properties for more than twelve years, during which time they have grown from gross receipts of approximately \$500,000 to about \$5,000,000. The properties consist of 316 miles of city and interurban railway system, much of which was built under Mr. Moore's direction. There are also many electric lighting companies scattered over the western part of Pennsylvania, a portion of Ohio, and West Virginia, embracing about 125 municipalities. The companies' power system now consists of 80,000 hp. in generating plants and has connected approximately 125,000 hp. in motors, electric railway, and power, besides a large amount of lighting, most of which has been added during Mr. Moore's incumbency. Mr. Moore is to continue with the company until the staff can be reorganized, his successor not having yet been appointed.

Mr. F. M. Feiker, who has been appointed editor of the *Electrical World*, has for the last three years been chairman of the editorial board of the A. W. Shaw Company, Chicago, publisher of *System*, *Factory*, and books on business. Born in 1881 at Northampton, Mass., Mr. Feiker was in 1904 graduated from the electrical engineering course of Worcester (Mass.) Polytechnic Institute, and spent the following year in special research work on high-potential generation and transmission as private assistant to Prof. H. B. Smith of Worcester. From 1906 to 1907 Mr. Feiker served as technical journalist for the General Electric Company. Joining the staff of *Factory* magazine at Chicago in 1907, he was appointed technical editor, and in 1909 managing editor. In the latter position he continued until 1912, when he was made chairman of the editorial board of both *Factory* and *System*, which post he held until his resignation to join the staff of the *Electrical World*. In 1912 Mr. Feiker delivered a course of lectures on industrial organization at Harvard University. He is an associate member of the American Society of Mechanical Engineers and of numerous organizations for the advancement of science, education and management. He is a member of the Engineers' Club, New York City; the University Club, Chicago, and the City Club, Chicago.

OBITUARY

George William Smith, who was president of the Frederick & Middletown Railway, Frederick, Md., before it was consolidated with the Frederick Railroad, now the Hagerstown & Frederick Railway, is dead. Mr. Smith was born near Frederick eighty-three years ago.

Clark O. Simpson, statistician of the accounting department of the New York (N. Y.) Railways, died on July 17, after an operation for appendicitis. Mr. Simpson was born in Troy, N. Y., on Aug. 20, 1865. At an early age he went to the Southwest, where he took up ranching for a few years. He then entered railway work and held positions with the United Railways, St. Louis, Mo.; Meridian Light & Power Company, Meridian, Miss., and the Birmingham Railway & Power Company, Birmingham, Ala. In 1902 he was appointed auditor of the Montgomery (Ala.) Street Railway, and two years later became manager of the Little Rock Railway & Electric Company, Little Rock, Ark. In 1905 he went into the banking business, but in February, 1909, he entered the service of the receivers of the Metropolitan Street Railway, New York. He was shortly afterward promoted to the position of statistician, which he held until his death. Mr. Simpson is survived by his widow and two sons and two daughters.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

*Jackson & Eastern Railway, Jackson, Miss.—Incorporated in Mississippi to build a steam or electric railway from Jackson to Union. Incorporators: S. A. Neville, R. W. Harris and C. J. Currie, Meridian.

*Cleveland & Sharon Rapid Transit Company, Cleveland, Ohio.—Incorporated with a capital stock of \$10,000. Incorporators: C. A. Blake, C. H. Felton, A. J. Schneider, C. A. Snyder and P. J. Potter.

*Dayton & St. Marys Traction Company, Covington, Ohio.—Incorporated to build a section of electric railway that will furnish a short line between Dayton and St. Marys. Incorporators: Judge Dennis Dwyer, Dayton, well known in electric railway circles; Julius Boesal, Thomas J. Brennan, C. V. Ruenke, J. B. Raterman, G. M. Apple, J. Guy O'Donnell, R. F. Alberry, Perry Moyer and F. E. Ratcliff. Capital stock, \$10,000.

*Mitchell Street & Interurban Railway, Mitchell, S. D.—Incorporated in South Dakota to construct 30 miles of trackage in Mitchell and vicinity. Capital, \$200,000. Incorporators, O. E. Cassem, L. E. Cassem, D. N. Hill, A. N. Hill, F. E. Hill, all of Mitchell.

FRANCHISES

*Mt. Clemens, Mich.—A Mr. Jacobson of Detroit has asked the Council for a franchise to construct an electric railway through Mt. Clemens. The line is to extend from Mt. Clemens to Armada.

Charlotte, N. C.—The Charlotte Electric Railway has asked the Council for a franchise to change the location of its First Ward line. The company desires to take up its tracks on Seventh Street from Davidson Street to Brevard Street and on Brevard Street from Seventh Street to Eleventh Street, and extend its line on Davidson Street from the point where the removal of tracks is begun to Ninth Street.

Portland, Ore.—The County Commissioners of Multnomah County have approved two franchises, one for O. M. Clark and associates, and the other for the United Railways, for use of the St. Helens Road to Linnton. The franchises approved were redrafts of franchises submitted by the two interests. Should the franchise to O. M. Clark and associates be accepted, work of constructing the railway to Linnton must begin in ninety days, and must be completed within one year. The United Railways already have track and equipment in place, so no time limit was made. The franchise granted to the United Railways provides only for freight traffic, while the Clark franchise provides for both freight and passenger service to Linnton, with twelve passenger trains daily each way, and a 5-cent fare.

*Bingham Canyon, Utah.—Harry S. Joseph has asked the Council for a franchise to construct an electric railway in Bingham Canyon to connect with the Salt Lake & Utah Railroad.

TRACK AND ROADWAY

Alabama Power Company, Anniston, Ala.—This company is considering the advisability of building an electric railway between Anniston and Blue Mountain City as an extension of the lines of the Anniston Electric & Gas Company.

Pine Bluff (Ark.) Company.—This company is rebuilding its line on Cherry Street at a cost of \$30,000. The orders for material have all been placed.

San Jose Traction Company, San Jose, Cal.—This company has placed in operation its 3-mile line from South Jacksonville to Hollywood.

Danbury & Bethel Street Railway, Danbury, Conn.—Plans are being made by this company to reconstruct its tracks on Main Street and Franklin Street. An extension

will also be built to connect with its present road operating from Bridgeport to Long Hill, thereby making a through route from Danbury to Bridgeport. The company is also extending its power lines.

Connecticut Company, Hartford, Conn.—The Public Utilities Commission of Connecticut has approved the application of this company for permission to build in Hartford on Myrtle, Grove, Broad and Washington Streets and Farmington and Commonwealth Avenues for a distance of about 7200 ft.

East St. Louis & Suburban Railway, East St. Louis, Ill.—This company has established regular service to Jones Pool, a popular bathing beach.

Peoria & Chillicothe Electric Railway, Peoria, Ill.—At a meeting of the stockholders of this company held in Peoria on July 24, the following officers were elected: E. A. Mitchell, Chillicothe, president and treasurer; John F. Lynch, Chillicothe, vice-president, and Arthur C. Black, Peoria, secretary. [July 17, '15.]

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—This company is now operating cars on schedule time between Wabash and Huntington, repairs to the tracks during the recent heavy rains having been made. It will not be necessary for this company to build new track as was feared at the time of the storms a few weeks ago.

Union Traction Company of Indiana, Indianapolis, Ind.—This company is reballasting its Muncie and Portland line between Portland and Red Key. Twenty thousand new ties will also be used in repairs on this line.

Arkansas Valley Interurban Railway, Wichita, Kan.—Material has been received and work will be begun at once on the extension of this company's line on Avenue A to the east limits of the city.

Ohio Valley Electric Railway, Ashland, Ky.—An extension of this company's line from Ashland to Russell is under consideration.

***Winnipeg, Man.**—Plans are being made to construct a line from Winnipeg to Transcona, 10 miles. Gasoline motor cars will be used. It is expected that the line will be completed by October and will be extended to the south side of Transcona early in 1916. H. W. Adcock, Winnipeg, is interested.

Bay State Street Railway, Boston, Mass.—It is expected that the work of extending the double tracks of the Bay State Street Railway in Methuen will start soon. The new line will extend from the present terminus at the corner of Hampshire, High and Lowell Streets to Railroad Square on the east side of the tracks of the Massachusetts Northeastern Street Railway.

Worcester (Mass.) Consolidated Street Railway.—Work has been begun by this company repairing its track in Grafton.

***Hillsdale, Mich.**—N. H. Pound, who has been at work on the proposition to establish an electric railway between Hillsdale and Pioneer, is said to have received a communication from the Toledo & Western Railroad offering to lease the line, furnish the rolling stock and operate it, giving to the builders of the line 5 per cent on their investment, and splitting all earnings above that amount. Mr. Pounds may be reached through the Hillsdale Improvement Association.

Cleveland, Alliance & Mahoning Valley Railroad, Alliance, Ohio.—This company is now operating its new extension from Ravenna through Leavittsburg to within 4 miles of Warren. The company expects to complete the line to Warren this fall.

Cincinnati, Lawrenceburg & Aurora Electric Street Railroad, Cincinnati, Ohio.—It is stated that negotiations are under way for the building of a high-speed electric railway from Anderson's Ferry, the terminus of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad, into the business center of Cincinnati. The lines of the company stop 6 miles from Cincinnati, and are without an entrance into the city. Plans now provide for securing a franchise from Cincinnati for the new line, which would be built on private right-of-way and would cost about \$100,000 a mile.

Sand Springs Railway, Tulsa, Okla.—This company plans to extend its lines 8 miles to the coal mines.

Shenandoah, Frackville & Pottsville Railway, Pottsville, Pa.—J. B. Trexler, 165 West Windsor Street, Reading, Pa., has been awarded the contract for grading between Frackville and St. Clair, 5 miles distant, for the new line of this company. The Shenandoah, Frackville & Pottsville Railway will connect at St. Clair with the Eastern Pennsylvania Railways.

***East Berlin & Abbottstown Railroad, York, Pa.**—About 100 citizens of Abbottstown, Gettysburg and East Berlin met at the latter place recently for the purpose of considering the question of restoring railway communications to East Berlin and Abbottstown. It was decided to organize a company to be known as the East Berlin & Abbottstown Railroad, with an authorized capital stock of \$70,000. A committee of twelve, which is virtually a temporary board of directors, was appointed to devise ways and means to perfect a permanent organization. This committee is composed of U. L. Gladfelter, S. K. Sowers, E. S. Brown, Dr. T. C. Miller, P. C. Smith, I. S. Miller, D. E. Brandt, H. J. March, W. D. Myers, C. C. Spangler, W. T. Baker, John O. Bosserman. A portion of the roadbed of an abandoned railroad was purchased several days ago by a private citizen for \$8,000, and the interest of this man will be handed over to the new company. The road is about 9 miles long, and extends from East Berlin to what is known as East Berlin Junction, where there is a connection with the Western Maryland Railroad. The motive power of the road has not yet been determined upon.

Washington Water Power Company, Spokane, Wash.—The municipal affairs committee of the Chamber of Commerce, in proposing the Clear Lake aviation site to the War Department Commission, which is searching for a suitable site for an aviation school, states that this company will extend its Medical Lake interurban line to the aviation grounds, providing the Clear Lake site is selected. The proposed extension would be 4 miles.

SHOPS AND BUILDINGS

Arkansas Valley Interurban Railway, Hutchinson, Kan.—The construction of the new brick passenger station of this company on Second Street East, Hutchinson, will be begun as soon as the present frame structure now on the site has been razed.

Detroit (Mich.) United Railway.—The company's engineering department has been instructed to proceed at once on plans and estimates to replace the Chelsea depot of the Detroit, Jackson & Chicago Railway, destroyed by fire last year.

Oregon Electric Railway, Portland, Ore.—The Oregon Electric Railway plans improvements to its local freight terminals in Eugene which will almost double their capacity. The company has under way a warehouse 50 ft. x 100 ft. at Harrisburg, for the storage of grain, wool, hops, etc., and warehouses at Forrest Grove, Woodburn and Butteville.

Southern Pacific Company, Portland, Ore.—It is reported that the Southern Pacific Company will construct a downtown station in Corvallis for its electric trains after the West Side line between Whiteson and Corvallis is electrified. The company has an option on property bounded by Sixth, Monroe, Fifth and Madison Streets, where it is thought the station will be built.

POWER HOUSES AND SUBSTATIONS

Ogden, Logan & Idaho Railway Company, Ogden, Utah.—This company has ordered from the Westinghouse Company two stationary substations, each consisting of a 500-kw. motor-generator set; 2300-volts, three-phase, sixty-cycle, 900 r.p.m. synchronous motor; 1500-volt d.c. generator; 10-kw. d.c. exciter; three 235-kva., single-phase sixty-cycle O.L.S.C. transformers, 45,000/2300-volts and a switchboard to control same; also a portable substation with similar equipment using three 187½-kva. transformers. This apparatus is in addition to the original order given the Westinghouse Company a year ago and is for the completion of the line between Ogden, Utah, and Preston, Idaho.

Manufactures and Supplies

ROLLING STOCK

Salina & Northern Railroad, Salina, Kan., has ordered gasoline locomotives for the passenger equipment of its new 100-mile line from the Internal Combustion Locomotive Company, Wilmington, Del. Delivery will be made in November.

Ogden, Logan & Idaho Railway, Ogden, Utah, noted in the *ELECTRIC RAILWAY JOURNAL* of July 10 as having ordered six trailers from the American Car Company, has specified the following details of this equipment:

Seating capacity	72	Cables	West.
Bolster centers, length,		Car trimmings,	
39 ft. 10 1/2 in.		Brill and Dayton	
Length of body .51 ft. 2 1/2 in.		Junction boxes	West.
Length over vestibule,		Couplers	O. B.
61 ft. 7 3/4 in.		Curtain fixtures..	Nat'l L. W.
Width over sills.....	9 ft.	Curtain material..	Pantasote
Width over all.....	9 ft. 2 in.	Pilots.....	Am. Car Co.
Height, rail to sills..	42 1/2 in.	Hand brakes	Lord
Sill to trolley base,		Heaters	Consol.
9 ft. 8 1/2 in.		Journal boxes	Brill
Body	all steel	Paint.....	Am. Car Co.
Interior trim,		Sash fixtures....	Nat'l L. W.
polished bronze		Seats	Brill "Winner"
Headlining,		Seating material,	
hard finished Agasote		dark green leather	
Roof	plain arch	Springs	Brill
Underframe	metal	Step treads	Universal
Air brakes.....	West.	Trucks, type,	
Axles	Brill	Brill 27-MCB-3X	
Bumpers,		Varnish	Murphy
angle iron, Am. Car Co.		Ventilators.....	Ry. Utility

TRADE NOTES

Ohio Brass Company, Mansfield, Ohio, has issued a folder on its flexible extruded trolley wire ears.

R. M. Campbell, for several years with the Ohio Brass Company and later with the Detroit Graphite Company, has resigned to accept a position with the Electric Cable Company, New York, N. Y.

Federal Signal Company, Albany, N. Y., has appointed S. J. Turreff, formerly superintendent of construction of its Western district, as office engineer with headquarters in New York City.

Automatic Ventilator Company, New York, N. Y., has received an order to equip with ventilators the compromise-type roof car which the Public Service Railway is constructing in its shops.

Cleveland Fare Box Company, Cleveland, Ohio, has received an order to equip with sixty No. 2 aluminum fare boxes the new cars recently purchased by the Detroit United Railway. This type of box is a size larger than the standard box used by this company.

Edgar F. Fassett, formerly general manager of the United Traction Company of Albany and for a number of years representative of the National Products Company, New York, N. Y., has been appointed special representative of the Electric Cable Company, 17 Battery Place, New York, N. Y.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has appointed W. P. Cochran, formerly branch manager at Baltimore, as assistant district manager of the Philadelphia district, including Baltimore, with headquarters in the former city. M. H. Jones, assistant to manager, will have charge of the Baltimore branch office of the company.

Edwin G. Hatch, New York, N. Y., consulting engineer, has been retained by the Victoria Falls & Transvaal Power Company, London, England, to handle the testing and inspection of a 9000-kva. transformer now building at the Westinghouse works at East Pittsburgh, Pa. Five similar transformers were shipped to the company's plant in South Africa in 1912.

Electric Cable Company, New York, N. Y., has established an office in the People's Gas Building, Chicago, Ill., under the management of James W. White, who, for a number of years, has been connected with the Union Switch & Signal Company as special representative and assistant to the vice-president in charge of sales. James M. Brown, formerly with the Lorain Steel Company, and Cyrus R. King, formerly with the Pittsburgh Steel Products Company, have also been assigned to Chicago.

S. K. F. Ball-Bearing Company, New York, N. Y., has received recent orders for journal bearings from the following electric railways: New York State Railways, for one experimental maximum-traction truck car, the body of which is now being built by the G. C. Kuhlman Car Company; Binghamton (N. Y.) Railway, for one Baldwin maximum-traction truck car, the body being built by the Cincinnati Car Company; Norton and Taunton Street Railway, Norton, Mass., for eight Brill single-truck cars, the bodies of which are being built by the Wason Manufacturing Company.

H. M. Byllesby & Company, Chicago, Ill., have organized a trading company to build up commerce between the United States and Central and South America. This concern is already incorporated and doing business under the name of the Byllesby Mercantile Corporation, with offices at 17 Battery Place, New York City. H. M. Byllesby of Chicago, for thirty-five years prominently identified with the development of electrical and other utilities, is president; vice-presidents are H. P. Schuck, formerly with W. R. Grace & Company, T. K. Jackson, president of the Mobile Electric Company; general manager, Chester H. Lewis, formerly of London, England. The new corporation will do a general exporting and importing business with Central and South America, Mexico and the West Indies, and its radius of activity may later be enlarged. It will be conducted entirely separate from the Byllesby steamship enterprise, the Caribbean & Southern Steamship Company, which is operating freight lines to Central and South America, Russia and Sweden.

ADVERTISING LITERATURE

McKeen Motor Car Company, Omaha, Neb., has issued a catalog describing and illustrating the latest developments in its railroad gasoline motor cars. The catalog contains illustrations of a 200-hp. gasoline motor car built by this company for the Central New York Southern Railroad, and of a 70-ft. post-office, express, baggage and power (300 hp.) car for the Union Pacific Railroad which pulls a standard steel passenger coach. The catalog also contains views and data of the McKeen highway coach, which may be equipped with rubber tired wheels for street and road service, or with railroad flanged wheels, for operation on urban rail lines. This highway coach is equipped with individual chairs, which have special pneumatic shock-absorbing cushioned seats.

Electric Service Supplies Company, Philadelphia, Pa., has recently issued a booklet "How Dollars Are Lost," in which there is an interesting calculation of the losses which result from poor rail bonding. For the purpose of illustration, a single-track railway 5 miles long was selected, with rails laid on rock ballast or on dry sand soil so that conductivity of the earth as a return conductor could be neglected. The resistance of the bonds, contacts and rails, under perfect conditions, is given as 0.2178 ohm, and a return current is assumed averaging 500 amp. at 600 volts, flowing 18 hr. per day, 365 days per year, at a cost 1 cent per kilowatt-hour. Then the annual loss due to resistance in the rail return will amount to \$3,577, of which \$3,292 is chargeable to the resistance of the rails themselves and \$284.78 to the resistance of the bonds. But if the bond resistances showed increase to an average of 10 ft. of unbroken rail, the cost of the increased loss would be \$849, or fixed loss, or if the bond resistance should increase to an average of 30 ft. of unbroken rail, the annual additional loss would amount to \$3,117. It has also been calculated that should 25 per cent of the 1758 bonds installed in the 5 miles of road have a resistance of approximately 0.001 ohm each that they would cause an annual loss of \$1,951 in addition to the normal or fixed loss. The book also contains data on rail, contact and bond resistances never before compiled in a single book.

Vol. XLVI

NEW YORK, SATURDAY AUGUST 14, 1915

No. 7

IT'S A POOR RULE—

A brief note in this issue reports that a British Columbia railway has asked what is apparently a permanent arbitration board for permission to reduce wages 15 per cent. This occasions surprise for the same reason that while we should give scant attention to the report that a dog had bitten a man, a report that a man had bitten a dog would be news of the highest order. But why not? If wages are to be raised on the application of employees because business is good and the cost of living high, why should not railway employers seek to reduce wages when, as is set forth in the Vancouver case, business is depressed. reduction in wages is general and the cost of living is going down? Of course, in an "arbitration" such as that by which the Chicago strike was ended, evidence on such issues has no particular weight. But if we are to depend upon arbitration as a means of adjusting wages it is just as reasonable to propose it as a means of lowering wages, when the employer thinks they should be lowered, as it is for employees to seek arbitration as a means of increasing wages. It would have a very healthy effect on public opinion if there were more offers to submit proposals to reduce wages to impartial adjudication—but preferably not to an "arbitration" in which a mayor with his eye on the labor vote has the deciding voice.

PROFIT AND LOSS SHARING

The acclaim accorded the prospect of a profit-sharing system for the employees of the Wilkes-Barre (Pa.) railways seems to have been wasted, for the Board of Arbitration, as announced elsewhere in this issue, is now to be reconvened to determine whether it erred in its recent award. According to the union representatives, the basic agreement did not authorize the board to fix any profit-sharing plan, and the award has never been signed. This state of the case merely shows the opposition of many men to assume any part of the risk and responsibility which partnership in any business enterprise entails. In taking this attitude, any individual and any body of men are entirely within their rights. Some people are so constituted that they prefer to get the money returns for their work at regular intervals in a pay envelope. Others are willing to take a risk for a possible larger reward. Each plan has its advocates and its advantages, but it is unreasonable for a man to demand as a right and in addition to his wages a share in the profits of a concern when he is unwilling to accept a share in the losses. A partnership plan, having for its basis an equitable division of future increased earnings between company and employee, works out in

theory to the immediate and material advantage of both employer and employee, especially in an industry where the latter comes into direct contact with the patrons. But the question arises, would the average employee be willing to divide the future losses as well as the future profits? In practice, and taking the average man, we believe he would not. Until partnership agreements meet the stress of such negative circumstances, their real potency as a solution of labor difficulties will not be fairly established.

CUMULATIVE VOTING IS DESIRABLE

In the great potpourri of proposals that have been placed before the New York constitutional convention, there is one deserving more attention than it has heretofore attracted. We refer to the plan of compelling corporations to adopt cumulative voting at stockholders' meetings for the election of directors. Under this practice each share of stock has as many votes as the number of directors to be elected, and the votes may be scattered among the nominees or concentrated on one or more as desired, with the result that the majority stockholders are not able to elect all the board of directors, the minority securing at least a representation. We believe that this method is an ingenious and praiseworthy way of conducting corporate elections so as to conserve the rights of minority stockholders and ameliorate the abuse of directorships. Under the usual American custom, the controlling stockholders elect not merely the majority but all of the directors, and the minority stockholders are often left unrepresented and powerless. To offset such an evil English companies very commonly limit by a graduated scale the number of votes allowed to one stockholder, the restriction falling most heavily on the largest stockholders. On account of the possibility of a man splitting up his holdings, however, this practice is not so desirable or effective as the cumulative plan adopted by some corporations in this country.

PRACTICE CONSERVATIVE AND JUST

The cumulative plan is not a radical one but a conservative protection of the rights of minority stockholders. There is no more justice in saying that minority stockholders should be content under government by a majority board than in propounding the preposterous idea that upon the election of a Republican or Democratic President all legislative and executive bodies throughout the country should be changed so as to conform *in toto* with the political status of the elected candidate. Minority representation is peculiarly an American right, and it is not shunned by intelligent

majorities. There are, of course, some objections to such representation in corporate affairs, such as the possibility of the election of persons without standing as directors, but it would be a safe wager that the average minority director could be as valuable an asset as the average overestimated and uninterested director-in-name-only. The disadvantages of the practice are certainly more than offset by the much greater advantages. Whether it should be secured by constitutional amendment, however, may be debatable. We do not favor the clogging of State constitutions with multitudinous details that would better be left to corporate by-laws and legislative enactments, but in this particular case we feel that the reluctance of corporate majorities to provide for cumulative voting in the by-laws and of legislatures to intervene in protection of minority stockholders rather urges constitutional provision for the plan. The State of Pennsylvania has satisfactorily handled this question in its fundamental law.

STARTING RESISTANCE OF ELECTRIC CARS

In starting cars, particularly in city service, the principal resistance is due to inertia rather than friction. The force required to overcome acceleration resistance is practically 100 lb. per ton per mile per hour per second, including a 10 per cent allowance for spinning the armatures. That is to say, at the ordinary rate of $1\frac{1}{2}$ m.p.h.s. a tractive effort of 150 lb. per ton is required. Compared with this, the starting friction is small, but it becomes relatively more important as the rate of acceleration is reduced.

There are indications of increasing interest in car friction at low speeds as greater attention is directed to the reduction of energy consumption. There are numerous formulas, with curves based thereon, which indicate a minimum resistance at zero speed, although this condition is known not to exist. The fact is that these formulas are based upon data obtained at ordinary running speeds, and the constant term which they all contain is correct only under the conditions of the experiments. It is misleading, therefore, to plot curves from these formulas down to zero speed. This fact is referred to in the recently issued sixth annual report of the Board of Supervising Engineers, Chicago Traction, page 425, where we read: "None of the empirical curves for free-running train resistance recognizes the fact that the resistance during acceleration is considerably greater than indicated by this curve, * * * that the curve of resistance is very high at the start, minimum at a moderate speed, rising with increasing wind resistance at higher speed." The board's engineers use $22\frac{1}{2}$ lb. per ton for their calculations of train resistance during acceleration of city cars, or nearly double the free-running resistance.

To quote another specific case: On page 239 of the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 7 are given the results of friction tests made on a 13-ton car by the Third Avenue Railway in New York. The resistance falls from 18 lb. per ton at zero speed to about $4\frac{1}{4}$ lb. at 11 m.p.h., rising to $5\frac{2}{3}$ lb. at 30 m.p.h.,

the average between zero speed and 15 m.p.h. being slightly more than $6\frac{1}{2}$ lb. The ratio of the maximum to the minimum was, therefore, $4\frac{1}{4}:1$ and of the average to the minimum about $1\frac{1}{2}:1$.

Elsewhere in this issue are given some results of starting-resistance tests made upon the Purdue University test car during the past year. The values obtained are quite high because this car is not in constant use, but they should be useful for comparison among themselves and with the results of free-running resistance tests described in the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 15, 1914, page 304.

All of these examples indicate that the familiar "friction of rest" plays a part in acceleration resistance. Fortunately, lubrication improves rapidly as speed increases, and the energy loss represented by the excess of resistance at low speed is not serious. At the same time more exact information on starting resistance is greatly desired. The condition is thus stated in the Chicago report: "The great diversity of opinion and results among various investigators suggests the necessity for further analysis, especially differentiating between train resistance during acceleration and during free running."

THE DETROIT SITUATION

Within a few weeks the people of Detroit will decide whether or not they want to purchase and operate the surface lines of the city, beginning Jan. 1, 1916. The outcome of the forthcoming plebiscite is forecasted by the vote taken in 1913 when there was created the Board of Street Railway Commissioners, empowered to negotiate for the purchase of the city lines. Various articles in this paper have described how the city is to acquire these lines at a price fixed by the Wayne County Circuit Court. Thirty days after a vote favorable to the purchase has been taken and suit begun by the city to compel performance of the purchase contract, the company must surrender its property, the profits from operation thereafter going to the city.

This situation is suggestive of what may happen in any city where franchises expire and there arises simultaneously a demand for municipal ownership. Obviously under such circumstances the city has the whip hand in negotiations that may be undertaken to acquire the property, and about all the owners of it can do is to protect themselves against confiscation. The fact that good service has been rendered and exceptionally low fares charged will not save a railway system from municipalization—if Detroit is to be taken as a ruling precedent.

It is true that the vote has not been cast, but the atmosphere is one in which a vote favorable to purchase by the city is most likely. Out of eleven men interviewed in Detroit ten agreed that the service was good and the rates low; that there was no reason for municipalization except the "feeling that the city ought to own its car lines." This feeling has been actively promoted by the most widely-read Detroit newspaper and a number of leading citizens. If Detroit does buy

the urban lines it will be done not on the basis of reason but as the outcome of a "feeling." Against an influence of this kind the exercise of reason is helpless.

If reason entered into the transaction the city's experience with its municipal paving plant would have a bearing upon the transaction, for without allowing anything for overhead, profit or a guarantee, the city cannot compete with private contractors in laying pavements. It nevertheless is drifting into municipalization of a much more complicated and difficult business. As to the lessons to be gathered from the experience of other cities in the electric railway business, those engaged in the industry and familiar with the results of municipal ownership and operation will be surprised to learn from the columns of the newspapers already referred to that municipalization is uniformly successful—in fact, a blessing wherever tried. The articles written by correspondents dispatched to various parts of Canada and the United States to investigate the subject prove this to be true.

So why argue about it? If the people want it or think they want it, they are going to have it. Those who have built up the Detroit system and have given not only good but enlightened and progressive service, and at the same time reduced fares to a minimum, have at least this satisfaction, that municipalization will not come about as a consequence of their errors but as a result of an artificially created sentiment, opposition to which would only have increased its intensity.

CORPORATION AND PUBLIC MORALITY

As a result of a persistent campaign, with Righteousness on its banner and the usual conglomeration of human motives in the hearts of its leaders, the idea has been widely spread that the conduct of corporations is on a lower moral plane than that where walks the average man, and immeasurably below the plane from which, in a rarified atmosphere of virtue, our rulers dispense a government guided by supreme wisdom, strict justice and a constant regard for moral values. This is what we are told, and it has been reiterated so frequently and so loudly that many of us have come to believe it. But it isn't true.

What "franchise grabber" has ever duplicated our performance in seizing the Panama Canal zone? The justification of this act or its condemnation is not to the point so far as this discussion goes; the point is that there was no general public disapproval of the government's act. Nor was there any considerable disapprobation heard when it was proposed to tear up the scrap of paper upon which the Clayton-Bulwer treaty was written and discriminate as to toll charges in favor of our shipping. Where was our enlightened moral sense when these things were going on? This question is pertinent because we are told that it is a wave of moral ideas that has swept men in the mass and governments in particular to the safe if shifty sands of probity and left the corporations struggling in the breakers of their own iniquity.

No rebate-taking corporation or discriminating rail-

road has ever duplicated the performance of the government in the parcel-post business. It has ruined two express companies and has the others struggling to preserve their existence. In accomplishing this the government has not merely accepted rebates; it has demanded and received free transportation for the greater part of the parcel post. There has been some sympathy for the railroads in this connection, but has anyone observed a moral revulsion against the unfairness of the government, the postmaster-general or the committees of Congress having this matter in charge? Seemingly the public is willing to accept the position of *particeps criminis* and enjoy participation in the ill-gotten gains secured by cheap parcel-post rates. We are glad to see, however, that the railroads are planning to seek justice in the courts. Last month seven of the principal railroads in New England filed claims for various sums ranging from \$4,424,713 down and making a total of \$10,880,865 on the plea that they have been wrongfully deprived of their property by governmental act.

The latest example of governmental disregard of property rights is the order issued by the Secretary of the Treasury, effective on Aug. 16, that all public money and securities be transported by mail instead of express. This is said to be a "reform" by which the government, by means of its frank, will save money. In other words, the government will let the railroads worry about the increased weight, the extra precautionary measures needed and the higher costs. If the transmission of this matter by the mails is desirable, the order to put it in force would have come with better grace if it had awaited the decision of the Court of Claims on the recent petition of the seven New England railroads, which involved as one of its counts the enforced carriage of gold as mail of the fourth class "in violation of law and without compensation to carriers."

The "you-are-another" argument never proved anything. It is not the purpose to employ it here. The purpose is to show that our governments do things so unmoral that no corporation would dream of doing them and that the public, far from condemning these things, frequently applauds them and in no case refuses to profit by them.

This is convincing evidence to reasonable minds that our government is, to say the least, no better than those whom it is supposed to instruct in good morals and to keep in the paths of rectitude. It suggests that the existence of new and higher moral standards is largely a myth so far as the general public is concerned; for of what value is "moral consciousness" if it remains awake only for its own profit and sleeps while the other fellow is being deprived of his rights? By all means let us have the highest standards of conduct for everybody, but let us not deceive ourselves into the belief that morality means the crucifixion of one class for acts which are approved or condoned if performed by another class. We are not likely in this way to maintain high standards in any part of the social organization or greatly to impress the supposedly unregenerate with the enormity of their crimes.

Route Signs for Surface Cars

Description of Novelties in Car Signs in Several Different Cities—Development of Route Numbers in Place of Destination Signs—Car-Diversion Signs in Boston

The importance of keeping the riding public informed as to street-car routes has, of course, been recognized at all times. In the early days of the street railway industry, when even the smallest cities had a half-dozen railways, cars were identified not only by their colors but by very elaborate lettering on the sides of the car showing the terminals and all intermediate places of importance. Some cars even carried elaborate paintings of the "moving van" school of art. As the small systems were consolidated, the scheme of colors for identification was abandoned, and the signs were reduced to the simple route indications still in common practice in this country. The principal departures in the East from this standard practice are found in Philadelphia and Buffalo.

The signs in those cities were the outcome of the development of the near-side car when a special study was made of car signs in this country and abroad. As

that it is not found necessary to refer to the schedule of the line, since the headway in large American cities is much shorter than on most of the European routes and since cars are operated during a longer period of the day.

In Philadelphia each line is indicated by a separate number. Experience has shown that a distinctive numeral is the simplest method of designating a street car route, not only because it is easily remembered but because it lends itself most readily to display as a large illuminated sign on the front of a car, which can be easily distinguished as the car approaches.

Auxiliary to this route number sign, the destination toward which the car is moving is indicated immediately beneath the route number. A recent refinement in this sign system is a red band or signal which can be dropped into place by the motorman so that it shows diagonally

ROUTE SIGNS—ILLUMINATED ROOF SIGN USED ON PITTSBURGH CARS

ROUTE SIGNS—LOS ANGELES FRONT-END SIGN WITH ROUTE AND CAR NUMBER

a result a system was developed in the belief that it includes the best features of European practice, namely, a simple outside sign which can be seen by a passenger at a great distance, and a long descriptive sign posted inside the car, usually over the archway, where it can be read at leisure. The departure from the European practice is that the letter or initial sign is carried in the vestibule window instead of being placed on top of the hood, and the roof has no long, wooden signs. The inside sign is like those used abroad with the exception

across the illuminated route number on the front of the car. This signal is used whenever the car is destined to turn "short" of the full route or is scheduled to go into the depot before reaching the end of the trip. The object is to call the attention of prospective passengers to the fact that the car is carrying a "short" destination sign, so that they may avoid boarding a car which is designated to turn before reaching the through terminal.

The name of the line and the route number are also

ROUTE SIGNS—VIEW OF INTERNATIONAL RAILWAY CAR, SHOWING LOCATION OF SIDE AND FRONT SIGNS

ROUTE SIGNS — FRONT AND SIDE SIGNS USED IN BOSTON

shown on both sides of the car in the panels immediately forward of the first window, the theory of this location being that passengers can thus get more particulars just as they are preparing to enter the car than they can get from the route number. For the further information of the public, a descriptive sign showing the route number and the names of the streets traversed is displayed inside the car in the arch at the forward end.

In Buffalo much the same system is used except that a side sign is carried below the eaves in the middle of the car. The front signs invariably indicate the names of the route, and the side signs indicate the routing. For example: the name "West Utica" shown in the accompanying illustrations indicates the name of that particular line. The side sign, "West Utica-Ferry," indicates the general route of that line.

Numbered route signs are a feature of the Pacific Coast electric railways. It is stated that the presence of large numbers of strangers is customary in the west coast cities, and it is much easier to explain to them the method of reaching a given point in a city by giving the number of a route than by repeating a combination of names. The use of the number also relieves regular passengers from reading more than one sign and in addition makes possible a very large indication. Illuminated interior signs, furnished both with ground glass having the number painted thereon and with perforated metal plates, are widely used, the advantage of the latter being

that when a change in route is made the metal plate may be shifted with less danger of breakage than one made of glass.

One of the illustrations on page 260 shows a novel route sign used in Pittsburgh. This is made of sheet metal with a hinged top of wood, the numbers showing white on a black background and being illuminated at night by interior lamps. The signs are mounted on the roofs of the cars, one being located near each end, facing toward the end of the car.

A novel illuminated end destination sign is manufactured by the Los Angeles Railway Corporation for its city cars. The case is of No. 24 gage galvanized iron, stiffened with two 3/8-in. x 1-in. iron bars and supported by cast end brackets. "Hunter" sign cloth with soft copper edges is

ROUTE SIGNS—CAR-DIVERSION SIGN USED IN BOSTON

used. This keeps the curtain straight and prevents the annoyance of raveling on edges. The cloth is 55½ in. wide and 40 ft. long, and the block letters are 5 in. high. The present number of names used is fifty-four, and there is sufficient spare cloth for seventeen additional

ROUTE SIGNS—PHILADELPHIA SYSTEM—THE VIEW AT THE LEFT SHOWS AN INTERIOR SIGN; THE VIEW AT THE RIGHT SHOWS ROUTE NUMBER AND LINE ON SIDE PANEL AND ROUTE NUMBER AND DESTINATION ON FRONT WINDOW

ROUTE SIGNS—VIEW SHOWING LOCATION ON CAR OF PITTSBURGH ROUTE SIGN

names. The car number is shown at the lower left-hand side of the sign. It is $2\frac{3}{4}$ in. high and is painted directly on the glass. The run number appears at the lower right-hand side of the sign, is 3 in. high and is made on two separate strips of cloth. One strip, $3\frac{1}{2}$ in. wide by 7 ft. long, carries numbers from 0 to 9, and the other strip, $3\frac{1}{2}$ in. wide by 9 ft. long, carries numbers from 1 to 20, thus giving a range of numbers from 1 to 200. The sign is illuminated by three inside 16-cp lamps, which are connected by wires running through $\frac{1}{2}$ -in. gas-pipe supports. The extreme dimensions of the sign are 16 in. x 11 in. x 5 ft. $3\frac{1}{2}$ in., and it is reported that the sign may be read distinctly one block away during the day or night. The cost of construction, ready to be installed on the car, is \$23.75.

Standard surface car route signs on the Boston Elevated Railway are numbered according to a system by which the number of the division is indicated by the first figure and the number of the route by the two right-hand figures. Thus, the meaning of the number 942 is Route 42 in Division 9. The standard end sign is $5\frac{1}{2}$ ft. long by 11 in. high and contains a possible set-up of about twenty-three routes and destinations.

ROUTE SIGNS — PERFORATED METAL SIGN USED BY THE UNITED RAILROADS OF SAN FRANCISCO

In the latest equipment the sign box is built into the monitor, as illustrated. The Boston Elevated Railway also employs on its surface lines a system of car-diversion signs which is of great convenience to the public when normal routes are altered. An illustration on page 261 shows one of these signs used on lines of cars which ordinarily traverse Boylston Street between Exeter and Arlington Streets, but were diverted on account of subway construction. The diversion signs are 14 in. wide by 21 in. high, and are printed on pink paper inserted in tin clips attached to the dash. The main feature is a broken arrow calling attention to the change of route and the name of the thoroughfare temporarily traversed in place of the normal route. The arrow is $1\frac{1}{2}$ in. wide. In some cases these signs are used in pairs at each end of the car, when the diversion involves more than one important street.

Diversions or the establishment of new routes are explained by the Twin City Rapid Transit Company in advertisements published in the daily papers. Such advertisements are used in connection with the company's regular advertising of special features along its line, such as parks and other pleasure resorts. In Topeka, Kan., also the changes in routing or schedules are advertised in the daily papers. However, it is found here that the press generally considers the matter of schedule or route changes to be of sufficient importance for classification as "news." Topeka also advertises special events on its lines, and states in these notices where cars are to be found when an occasion such as a concert warrants storing a number of extra cars to take care of the rush of traffic at its conclusion.

Fire Insurance

The Writer Describes the Three Kinds of Insurance Companies and Gives Suggestions as to Forms of Policies

BY W. H. FORSE, JR., SECRETARY AND TREASURER UNION TRACTION COMPANY OF INDIANA

The Association of Lloyds, with offices in London, insures ships and cargoes on every sea. The organization is more than 200 years old and still clings to its ancient custom of tolling a bell and crying the name of a vessel which has been lost. It is said that when news was received in the Lloyd's board room, of the loss of the German cruiser Emden which had sunk numerous British vessels, the members of the association drowned out the noise of the tolling bell in applause. The Emden had destroyed so many ships and cargoes insured by the Lloyds that its removal was a distinct relief to the brokers who were carrying marine risks.

Within recent years the Lloyds Association has extended its activities to embrace risks of almost every conceivable description. The underwriting members of the association deposit securities to guarantee their engagements, and when a ship or other risk is offered for insurance, each member indicates the amount he will underwrite, the insurance being effected as soon as the amount has been made up. The members generally act in groups through an agent, and there may be fifty to 100 or more underwriters to one policy, not all of whom assume the same percentage of the risk. Each underwriter under such a policy deposits with the committee of Lloyds a policy of insurance against his insolvency, in a form approved by the committee.

In the year 1913 the Brooklyn Rapid Transit Company transferred about \$22,000,000 of its fire insurance from companies represented by the New York Fire Insurance Exchange to the Lloyds of London, thereby sav-

ing about \$27,000 a year in premiums. This action was taken, according to President Timothy S. Williams of the transit company, because the rate of premium had been arbitrarily raised from 34.7 to 62.3 per \$100 by the exchange representing the companies which had been carrying the insurance. In 1914 the transit company again placed its insurance with American stock companies. It was stated at the time the insurance was placed with Lloyds that the Brooklyn Rapid Transit Company had for some years been accumulating an insurance fund which then aggregated \$600,000, and it was hoped that the company would eventually carry all its own insurance.

Within the past two years, Lloyds of London has written a few policies for American electric railways, indemnifying them for sums which they shall be required to pay persons, not employees, as compensation for injury or damage arising out of accidents caused by or growing out of the operation of the cars of the railways. It is expressly stipulated in these policies that Lloyd's shall be liable only for an accident whose total cost is more than \$20,000, and then only up to \$100,000 for such accidents. In other words, if a company has an accident causing the payment of damage claims to the amount of any sum less than \$20,000 it is not insured; if the claims paid amount to \$20,100, Lloyds will pay \$100; if the accident costs \$120,000 or more Lloyds will pay \$100,000, the amount of excess over \$20,000. This is specific insurance against an extraordinary casualty, and as such is written at a much lower rate than a policy which insures the carrier against any and all accidents.

The premium for insurance against bodily accident which the ordinary individual carries is written at a high rate because it includes provision for minor accidents and partial disability, which are by far the most numerous; on the same principle the insurance company must charge a prohibitive rate if it takes all the risk of public liability of the railway. The Lloyd's plan, which is mentioned, corresponds, in a sense, to the payment of the capital amount only under an ordinary accident policy, and as such is correspondingly cheap.

FACTORY MUTUAL AND STOCK COMPANIES

Factory mutual fire insurance was originated by Zachariah Allen, a prominent manufacturer of Providence, R. I., eighty years ago, and the policy always followed has been to conduct a business without purpose of profit but based on recognizing and encouraging apparatus and organization for fire prevention. When the automatic sprinkler was invented, almost its sole encouragement during the first decade was found in the factory mutual risks, and to-day the risks insured in factory mutuals are almost without exception equipped with automatic sprinklers.

The six senior companies associated in the office of the Manufacturers' Mutual Fire Insurance Company had at the end of 1914 almost \$888,000,000 of fire insurance in force. These companies have reduced the cost of insurance from 84 cents per \$100 in 1835 to 5.9 cents per \$100 in 1914, notwithstanding they suffered in the year 1914 the heaviest loss in their history.

The factory mutuals have not confined their protection to textile mills or to factories. They are at the present time carrying insurance on carhouses and other properties of electric railways. When such buildings are equipped with automatic and other devices designed to prevent and extinguish fires, arrangements can be made with the factory mutuals to carry the insurance at rates which are exceedingly reasonable. In cases where the sprinklered risks are a goodly percentage

of the amount of property insured, the factory mutuals have in very rare instances agreed to write the sprinklered buildings in their own association and to underwrite the unsprinklered portions in the "old line" or stock companies. The stock companies will usually meet the competition of rates on sprinklered properties made by the factory mutuals, and competition of this sort, at living rates, is good for the industry.

A very large percentage of the total fire insurance written in the United States is carried in "stock" companies with stockholders incorporated to engage in the insurance business for profit. There are about 200 American stock companies and about fifty foreign companies with American branches writing fire insurance with assets ranging from a few hundred thousand dollars to more than \$20,000,000 each.

FORMS OF POLICIES AND TENDENCIES OF PREMIUMS

It is customary for the insurance company to demand the insertion of a "co-insurance" clause in return for a concession in the rate which is charged. The insertion of such a clause compels the assured to carry a stated percentage of insurance to value or, in the absence of such insurance, to carry a portion of the risk, thus acting as co-insurer of his own property. These percentages commonly range from 80 per cent to 100 per cent, the latter percentage being applied to rolling stock, because it is considered, of all electric railway property, to be that which is most subject to destruction by fire. It is necessary, when a loss occurs under a blanket form item, to make an inventory of appraisal of all the damaged and undamaged property under that item in order to be certain the proper percentage of insurance has been carried. If the item is rolling stock, for instance, this is objectionable on the score of inconvenience and the possibility of differences of opinion regarding values. The form should contain a provision to the effect that an inventory or appraisal is not necessary or required when the loss does not exceed a certain percentage (say 5 per cent) of the total amount insured under that item. This is very convenient and obviates the necessity of making an inventory or appraisal after the majority of rolling stock fire losses. Its inclusion, if insisted upon, will save considerable inconvenience and expense to the insured.

It is encouraging to note that because of the constant improvement in construction standards, in wiring specifications and in fire-protective devices, the premium rates of electric railways tend downward. The premiums paid by the Chicago City Railway Company were reduced from \$2.22 in July, 1905, to 68 cents in October, 1907, and 48 cents per \$100 of insurance in November, 1909. The Public Service Corporation of New Jersey in December, 1914, carried \$29,000,000 of insurance at 35.4 cents, which was a decrease from 38.3 cents in 1913 and 44 cents in 1912. In June, 1914, the Philadelphia Rapid Transit Company took out policies of insurance aggregating \$23,000,000 for three years to June, 1917, which was written at the annual rate of 25 cents per \$100. There had been previous reductions from 50 cents in 1911 to 45 cents in 1912 and 35 cents in 1913.

Deliveries have been begun on the 478 all-steel car bodies with which the Interborough Rapid Transit Company is replacing all the composite bodies in its subway system. The shipments will probably be completed before the end of the year. The bodies will be the same as the latest type of all-steel bodies in service in the subway. The new bodies will be equipped in the railway shops with trucks, wiring and control. New controllers will be applied.

Ironing Out the Wrinkles

The "Wrinkles" to Which the Author Refers Are the Annoyances, Fancied or Real, Felt by Passengers—
Examples Are Given, with an Account of the Methods by Which
the Company "Irons" These Wrinkles Out

BY A. W. WARNOCK, GENERAL PASSENGER AGENT TWIN CITY LINES, MINNEAPOLIS AND ST. PAUL

Wrinkles are always annoying. They tend to disturb peace of mind, they indicate wrong conditions, and they are always an economic waste even though they may be unavoidable. Wrinkles are only another name, in the transportation business, for complaints. Executives the country over are busy these days ironing out the wrinkles and, to continue the metaphor, endeavoring to keep the fabric smooth.

What are the general basic causes for complaint on the part of patrons as far as street railway trainmen are concerned? Undoubtedly there are some standard mistakes that trainmen the country over make every day with resulting trouble to the employing companies. As years have gone by, we have been interested to list the causes that have come under our observation.

First, there is the general fault of incivility on the part of employees, and that sweeping charge can easily cover a multitude of offenses. If all employees were civil and used good judgment under all circumstances, most of the other complaints would vanish. Then comes the collection of cash fares, disputes over the amount of money paid by the passenger and the change returned by the conductor, the collection of fare twice from persons not sitting together for whom fares have already been paid by some other member of the party, as well as the familiar one, sometimes anonymous, that the passenger did not see the conductor ring up his fare or that of others. Then there is the complaint of the passenger who, in payment for his fare, tenders a bill of large denomination which the conductor is unable to change.

Transfers are a fruitful source of complaint. We all know the passenger who complains because the conductor did not give him a transfer, usually because he refused to accept the transfer when it was offered. Transfers that are not valid make much trouble, and the reason for non-acceptance is as likely to be the fault of the passenger as of the conductor. Perhaps the passenger has used his transfer as a stop-over ticket and still feels that he has a right to continue his ride on it. A transfer that is mispunched as to time or direction, exposing the passenger to trouble with the second conductor, is a mistake clearly attributable to the conductor. While a conductor may issue a mutilated transfer to a passenger, the chances usually are that when such a transfer is tendered to the second conductor, it was the passenger's fault in the way he took care of the transfer, or rather the way he did not take care of it after it was given to him. Companies have always reasonably required that transfers should be used at regularly designated transfer points, so that when passengers get on at the wrong place by walking some distance away from the transfer point, maybe to do some errand, another complaint is sure to arise.

The responsibility for mistakes in change usually may be divided evenly between the passenger and the conductor. There are passengers who are sure they received short change. Others are sure that the bad coin they got was given to them by a conductor, while other passengers object strenuously if they do not receive

exactly the kind of change they ask for. One passenger wants nothing but paper money, while another wants nothing but quarters or half dollars, and if they do not receive exactly what they request they feel that the conductor should be severely reprimanded.

Other passengers complain because conductors allow disorder on cars, intoxicated persons, whether objectionable or not to passengers, as well as spitting and smoking in cars. While there may be ordinances against spitting, nevertheless, passengers may do so surreptitiously. Some passengers feel that the conductor should have spitters arrested, even though the conductor did not see them commit the offense. The same principle applies to smoking, which is permitted in many cities under certain circumstances.

It is proverbial that many passengers (usually women) have easy consciences as to the age of children in their charge, and while conductors may properly put questions, the average passenger resents strenuously the implication thereof, asserting that the child should not pay fare and that doubting the child's age is an insult. Other passengers of the genus "butt-in" who are not inconvenienced themselves complain because they see children, for whom fares have not been paid, occupying seats. The refusal of a conductor to allow a baby go-cart to be taken on a car starts more trouble. This is a privilege that may be allowed if the go-carts are of a certain size and type. It is hard to argue with a parent that there is a difference in baby carriages. One woman contends plausibly that, if her neighbor is allowed to carry a go-cart of collapsible shape, there is no reason why she should not take a perambulator aboard with her.

Watches do not always agree, yet many a passenger who has missed his car is sure the train crew wilfully left the terminal ahead of time and want the men laid off for a week, particularly in view of the fact that the passenger says he "gives the road 20 cents a day." Just as though we gave him nothing in return!

We all know that it is a difficult matter to have conductors use tact in seeing that the seats are properly occupied. No matter how gently they may hint that passengers move over, resentment is likely. The passenger who is looking out to regulate the company's business feels sure it is easy for the conductor to see that all of the seats are properly filled and that no passenger plays the rôle of car-hog to the inconvenience of his neighbor.

If all our conductors had good carrying voices and were never distracted from such a duty, how our patrons would appreciate it if they would always call the names of streets or stations clearly! As we know, that is a feature of service that is not always well done, and so the man looking for trouble has another grievance.

A passenger may get on a car without knowing where the car is going, and if he finds he is on the wrong car he will complain with vigor that the signs on the car were not only set wrong in the first place but were changed en route in the second place. Sometimes such a mistake is made by a conductor, but more often the

passenger has only himself to blame for not making sure that he was getting on the proper car.

Companies generally take great pains to restore lost articles to their owners, so some passengers take it for granted, when they do not recover their articles, that they have been taken by the conductor. A man is sure he left the article on the car and, because he has not been able to find it, that the conductor must be in possession. How often have well-meaning persons maintained that such and such a conductor is dishonest without any evidence on which to base such a charge! Only recently we had a case where a woman was positive that she had lost a well-filled purse on a car, that the conductor was the only man on the car when she got off and that he had her property. She was a woman of high character, and her assertion necessarily was taken seriously. We had a careful check made. The conductor stoutly maintained that he was innocent. Three days elapsed and, to the credit of the woman be it said, she came to the office and frankly admitted that she had not lost the purse in the car at all but had left it at home on her dressing table. Passengers often think it unjust not to be allowed to reclaim their articles from conductors without the articles going through the lost article department, providing they meet the car on its return trip and know that the article has been found. They do not stop to think that when they get off they ceased to be passengers and that it is the duty of the company to have the property go through authorized hands, only with the idea of restoring it to its proper owner.

We all wish to make good transfer connections between lines that intersect, but in rush hours it is impossible to hold cars any considerable time to do so. When a passenger misses connections because one car does not wait for the other, he rarely stops to think that a wait of several seconds means delaying a large number of other passengers.

Some passengers blame us if they get on wrong cars either as to route or direction. They do not seem to think it necessary to ask a question or two to make sure that they are getting on the car they need. Others, regardless of the comfort of fellow passengers, open or shut windows in inclement weather to suit their own convenience, and conductors are held responsible for such lack of consideration. Timid passengers are positive that cars run too fast and make serious charges against trainmen of reckless operation. Trainmen forget to throw off bundles of newspapers, and then complaints come from those for whom such service is rendered.

The failure of motormen to stop cars to take on passengers, to stop exactly on crosswalks, at station platforms, or when bell signal is given for the next stop, opens up other avenues of trouble. Perhaps the car has a heavy load and cannot take on more passengers; perhaps the rails are slippery and the car may slide by the crosswalks or the station platform; or perhaps the signal bell, like any mechanical contrivance, has suddenly got out of working order so that the signal bell in the motorman's cab does not ring. The passenger is likely to feel that the motorman has wilfully inconvenienced him.

General criticism of service is perennial. Insufficient service and interrupted service, no matter what the cause, are sure to bring down a shower of protests. Is there ever a time when everybody feels that he is getting sufficient service and that conditions are entirely satisfactory? Sometimes we are inclined to question whether that happy condition can be realized, and in our pessimistic moments we feel that nothing we are doing is being done properly.

In the early days of street railways, patrons were not captious about the distance between stops, but every street railway to-day is besieged with applications for new stops. Every passenger seems to feel that he must be carried to his doorstep. He can see no fairness in the idea that regularly opened streets are not sufficient stops to take care of the public.

Some patrons have a cold-air monomania, while others are warm-air crazy. What a difficult matter it is to have cars ventilated and heated to the satisfaction of all! When one considers the odors clinging to many passengers, is it any wonder that sometimes, particularly in the winter time, the air does not resemble a fresh rose? Persons with soiled, wet clothing, working men with the smell of their toil on their garments, as well as sick persons exuding an unhealthy fragrance, seriously vitiate the air in any car, no matter how efficient the ventilating system may be. While we may be doing the best we can to supply efficient service in that respect, nevertheless there are passengers who feel that if they could look after the heating and ventilating of equipment it would be done much better. The passenger who is sure that Car No. 8003 has a flat wheel is numerous, and the one who declares the brake on Car No. 7008 is particularly and peculiarly noisy, has many following in his train. Sometimes, by the way, both complaints are true.

There is just complaint from passengers when they see employees in uniform occupying seats to the exclusion of cash-paying passengers. There are those who feel that they should be permitted to carry their dogs or cats a few blocks on cars and that the rule forbidding it infringes on their rights as free-born American citizens.

Perhaps you will think of other causes for criticism and will feel that the above list is incomplete. Perhaps it is incomplete, but we are inclined to the opinion that all matters of criticism will readily classify themselves under one of these headings, if not under the general heading of incivility. So many folks have been insulted, humiliated, abused and on most occasions because of trivial errors on our part which might have been avoided.

With such causes for criticism, what is the best way to meet the complaining passenger and iron out the particular wrinkle he brings?

ANSWERING COMPLAINTS

For a long time we have made a practice of advertising for complaints in frequent newspaper advertisements, and in a card displayed in every car we always have a foot line in large type reading as follows:

"Complaints and Suggestions Always Receive Prompt, Courteous Attention."

We believe the policy expressed in that line carefully carried out will do more to make good will than can be easily estimated. Furthermore, we do everything in our power to back up such a promise with faithful performance and make good in that policy in every practicable way. It has worked and is working to our great satisfaction.

To carry out such a policy it is necessary to have strong faith in human nature and to entertain the feeling that the average passenger is as responsive to good treatment and is as desirous to be fair as we are. In the executive offices of a large mercantile establishment the writer remembers to have seen this motto: "The Customer Is Always Right." That is a principle which can certainly be applied by transportation companies to the hundreds of minor complaints. Of course, such a principle would be disastrous if followed in the claim department, but in the present article we are discuss-

TWIN CITY LINES—CASH FARES AND TRANSFERS

Please try to provide yourself with small change—a dollar or under—with which to pay your fare. It is physically impossible for conductors to carry enough silver conveniently to break many bills or gold coins. Conductors are frequently obliged, when large bills or coins are offered, to give passengers small and bulky change, often to the annoyance of the recipient. If the passenger will exercise a little forethought, not only to see that he has money for his fare, but that it is not of large denomination, he will escape change annoyances.

Ask for and see that you receive your transfer when you pay your fare. While the conductor is supposed to offer a transfer to the passenger when he collects the fare, there is also a responsibility resting upon the passenger to see that he gets his transfer. Conductors are permitted to issue transfers only at the time of receiving fare. This is the convenient system used in all large cities and it is designed particularly for the benefit of patrons. It disposes of the entire fare transaction at the one time. Remember to get your transfer!

Be sure to tell the conductor to what line you desire to transfer, so that he may punch your transfer correctly. Always bear this in mind, and you will be better served.

Do you know the general conditions under which transfers are issued? Have you ever read the few paragraphs on the back of a transfer, stating the general privileges extended by the Company to you?

We reprint here the information borne on the back of our transfers. It is easily understood. If any of these conditions are not quite clear to you, we will be pleased to make them so on request, and will gladly furnish any other transfer information you desire.

In all cases of dispute regarding cash fares or transfers, passengers are requested to pay conductor's claim and report the facts for prompt adjustment. Patrons will appreciate that conductors are governed by rules which they are not authorized to change. Necessarily they must be guided by rather rigid rules in such matters. A passenger can depend upon it that we will always make right any overcharge or adjust any fare troubles he has had. Compliance with this suggestion of bringing all such matters to our attention, without controversy with the conductor, will save you annoyance.

ADVERTISEMENT USED BY TWIN CITY LINES

ing the average complaint, which has no farther-reaching effect than that it may continue to irritate the passenger who has had the experience in such a way that he will tell his story to many persons and harbor a grudge against the company. In the aggregate such grudges work serious detriment.

Lincoln contended that yielding larger things to which one could show no more than equal right, and yielding lesser ones though clearly one's own, was the best way to avoid a quarrel, and our experience would lead us to believe that making all reasonable concessions to patrons not only irons out the wrinkles but is the best way to make friends.

Take the matter of making change. A passenger claims that the conductor said that he received only a nickel, whereas the passenger says he gave him a quarter. The old-time method of handling a complaint of that kind was to take the matter up first with the conductor and let the passenger wait a while. The conductor, of course, says he was right. After great delay perhaps the matter was settled as the passenger desired, but with no thanks on his part. Why would it not have been better to have accepted the passenger's word at the outset and handed him back 20 cents at once, or whatever was the disputed amount of money, usually not large? We have settled hundreds and hundreds of cases of this kind, and it has been our experience that the amount of money in dispute would not average over 35 cents in each case. We never had a "repeater," despite the possible charge that we were easy and could be worked, all of which shows the honesty of the average passenger. Every time we have settled we have pleased the passenger. Scores of appreciative letters have come to us after such incidents.

A passenger claims that he himself, his wife, or some member of his family received discourteous treatment at the hands of a conductor. Why not admit to the passenger that the conductor was wrong and that he will be checked at once, even though results may show, when the matter is investigated, that the conductor was not entirely to blame? The law's delays have never

been any more aggravating than the delay a passenger experiences if he puts in a complaint as to some injustice which he thinks has not received the attention it deserves. Delayed apologies never do the same good that apologies do directly after the trouble. That's human nature. Making apologies in a straightforward way does anybody good.

We are all striving for the good will of our patrons. It is our sincere intention to give our patrons the very best possible service under all circumstances, and we want the friendly support of the people who give us their nickels every day. Perhaps some patrons bring us complaints that are amusing or unfair, but nevertheless the executive who receives the complaints, whether from the person direct, by letter or by telephone, should exercise good humor, kindness and sympathy to the complainant in such a way as to mollify him. Take his point of view. Never become embittered and never resent hotly any charges made. There is not one occasion in ten thousand when we can afford to lose our tempers, although undoubtedly we all fall short of that standard. Losing tempers has done much to cause hostility to "big business." There's nothing gained by riding a high horse.

Long-winded arguments over trivial points do not convince, they only irritate and annoy, and after such an argument the patron, who may have become angry, leaves with hatred rankling in his breast, whereas with tactful treatment he might have left with the kindest feelings toward the company. It is not always possible to win over everybody, and we all regret when a patron comes in wrought up over some trifling matter and it is impossible to iron out his wrinkle, try as hard as we may. To the credit of human nature we believe that such cases are exceptional. The average case can be handled in the manner suggested and an enemy turned into a friend, with the resulting corollary of a liability being turned into an asset. We believe that the average kicker can be turned into a staunch supporter if he sees that our disposition is to treat him fairly. Ignorance of conditions is the reason why many find fault. If you can explain to him, talk or write to him, you will find the average passenger disposed to be fair and reasonable.

The average suggestion for the improvement of service received from patrons may be impracticable, but once in a while we have received a good suggestion, and its adoption has meant a step forward in serving the

TWIN CITY LINES—GENERAL SUGGESTIONS

Many patrons, desiring to assist us in giving good service and for the comfort of all, have suggested that we remind passengers to help abate the following nuisances, some of which are against health:

Do not bring dead or smoldering cigars into a Car.

Do not spit in any part of a Car. The law forbids this practice, and in the interest of health, comfort and cleanliness you are asked to comply with this sanitary regulation.

Do not deposit nutshells, fruit skins, papers or other litter in any part of the Car.

We desire to keep our Cars in a clean and sanitary condition and we are employing every means to do so. To achieve this result we must have the co-operation of passengers.

Be sure that you get on the right Car. Sometimes a passenger will get on a Short Line Car, taking it for granted that he is getting on a Long Line Car, and then later finds, to his inconvenience, that he is not being carried to his destination. It is always best to be sure that the Car you are boarding is the one you need. Look at the signs the Car carries.

Do not occupy more than one seat. If a passenger will extend the courtesy of "moving over" for others, he will find other passengers more disposed to extend a like courtesy to him. We are sure that a little consideration also extended to the conductor will inspire him to a much higher quality of service.

Some writer has wisely said: "There is no place in which the Golden Rule can be so effectually employed or will pay such large dividends, both as to one's relations with the Car employees and fellow passengers, as on a modern Street Car."

TWIN CITY LINES—STREET CAR DELAYS

Delays to Minneapolis Street Car Service on Thursday, April 15, were as follows:

An automobile broken down on the track at Laurel Ave. and Ash St., held the Bryn Mawr line at that point 66 minutes from 9:35 a.m.

The Snelling-Minnehaha line was held 20 minutes from 2:15 p.m. by a fire at Bates Ave. and 7th St., St. Paul.

On account of trolley wire being torn down at Virginia and Como Aves., St. Paul, by a grading machine, the Como-Harriet line was delayed 17 minutes. This gap in the service reached Central Ave. and 4th St. S.E. at 2:41 p.m. from which point the station filled in for the delayed cars.

As the result of sand and water on the track at Como and Bedford Aves., St. Paul, the Como-Harriet line was held at that point 32 minutes from 5:25 p.m.

Complaints and Suggestions Always Receive Prompt, Courteous Attention.

public. We acknowledge with gratitude having received many good ideas from patrons in answer to the invitation we extend to send in suggestions as well as complaints. Of course, we have received hundreds of half-baked, amusing ideas, but given in such evident good faith that the smile was repressed. Perhaps the blue ribbon suggestion of this class was given to us recently by a very tall, thin gentleman wearing bushy side whiskers and wearing his hair brushed back, as George Ade said, "like a sea lion." He wanted to sell hot coffee, sandwiches and "sinkers" from a little counter to be installed on the rear platform of each car. He said that such a quick lunch service would make us very popular with those who had hurried off without their meals and would be a boon to husbands whose wives were away on vacations. He also pointed out that it would be rather sociable to see a carload of passengers munching sandwiches and drinking hot coffee together!

In the past year we have printed many newspaper advertisements with the idea of taking patrons into our confidence and of asking their co-operation to reduce the little frictions between them and our conductors. The gist of some of these advertisements, with the text as printed in the papers, is given herewith. Perhaps they may be suggestive to JOURNAL readers.

"Safety First" is good, but "Safety and Courtesy First" is better, and we believe that is the general watchword all along the line in electric railway circles to-day. We all want our trainmen to live up to our highest ideals as to proper treatment of passengers. No matter how hard these men may try to perform their duties efficiently, there is bound to be a crop of dissatisfied passengers. Our work is to get after the dissatisfied passengers, no matter whether they are right or wrong, try to get their point of view, try to straighten out their difficulties, and do everything reasonable to show them that we want to serve them well. It is the best and most sensible policy to pursue in building up a good feeling in the community which we serve.

Engineering Congresses at San Francisco

More Than A Quarter of the Enrollment for the International Engineering Congress Is Foreign

The ten days from Sept. 16 to Sept. 25 will be devoted to engineering congresses in San Francisco. The largest four engineering societies will hold separate conventions on Sept. 16 and 17, the A. S. C. E. at the St. Francis Hotel, the A. S. M. E. at the Native Sons' Hall, the A. I. M. E. at the Hotel Bellevue and the A. I. E. E. at the Civic Center Auditorium. Sept. 18 and 19 will be given up to excursions and Sept. 20-25 to the International Engineering Congress.

On July 12, 1915, 2927 members were enrolled for the International Congress, the membership of the five participating societies being represented as follows: American Society of Civil Engineers, 780, or 10.1 per cent; American Society of Mechanical Engineers, 454, or 7.4 per cent; American Institute of Electrical Engineers, 393, or 5.1 per cent; American Institute of Mining Engineers, 320, or 6.4 per cent; Society of Naval Architects & Marine Engineers, 69, or 8.3 per cent. The foreign membership is 27 per cent of the total enrollment. California leads the States with 466 members, New York comes next with 446, Pennsylvania has 176, Illinois 111, and Massachusetts 88. Among the foreign enrollments are: Canada, 106; Great Britain, 91; Germany, 59; France, 58; Japan, 54; Australia, 41, and Brazil, 40. Official delegates have been appointed by Switzerland, China and the Royal Institute of Engineers of the Netherlands.

On July 12, 1915, 192 papers had been received, distributed as follows:

Vol. 1.....	20	Vol. 7.....	9
Vol. 2.....	21	Vol. 8.....	11

Mr. Brownell Continues Popular Safety Lectures

An account of the safety educational work of H. L. Brownell, safety inspector Chicago Surface Lines, by means of moving picture lectures in parks and schools, was contained in the ELECTRIC RAILWAY JOURNAL of April 17, 1915. Evidence that this safety work, which Mr. Brownell has conducted regularly for the third summer in the Chicago parks, cannot be classed as

AUDIENCE AT A SAFETY LECTURE IN LINCOLN PARK, CHICAGO

being merely of the spasmodic "brass band" variety is well shown by the accompanying flashlight photograph of part of an audience of 10,000 persons who gathered to hear him. The photograph was taken from the marble grandstand in Lincoln Park.

In connection with his safety work Mr. Brownell has recently issued a pamphlet entitled, "Safety for You and I," which contains a series of safety instructions, divided into three parts; instructions for small children, instructions for older children and those for grown-ups.

In a recruiting campaign inaugurated in Toronto during July one of the Toronto Railway cars was utilized. It was decorated with bunting, and bore a destination sign of Berlin and signs of various sorts to induce men to enlist.

Scientific Coasting at Oakland

Even with Faster Schedules, Coasting Has Increased from an Average of 15 Per Cent to 34 Per Cent and Energy Consumption Has Decreased Materially

During the early part of the year 1913, the San Francisco-Oakland Terminal Railways installed for trial use ten Rico coasting recorders, enough to equip completely all cars on its West Eighth Street line at Oakland.

For seven weeks before the trial, weekly records were made of total kilowatt-hours, of kilowatt-hours due to propulsion alone (average lighting hours and number of heating units being known), total car-miles, total car-miles of coasting clock cars alone and total passengers. Similar records were made weekly during the four-weeks' test period, from May 24 to June 21, and for four weeks following the test period. The three sets of observations gave these significant results: Before the recorders were installed the energy consumption per car-mile averaged 3.31 kw.-hr., or 174 watt-hours per ton-mile, and coasting was but 7.84 per cent, although it may be added that the coasting average for the system as a whole was about 15 per cent.

With the inauguration of the coasting clocks and instruction service on the cars the percentage of coasting rose to 27.60 per cent, and for the week ending the test the coasting was 41.70 per cent. The result is reflected in the averages of 35.34 per cent coasting, 2.5 kw.-hr. per car-mile and 131 watt-hours per ton-mile shown in the accompanying graph, the whole meaning a saving of 24.5 per cent in energy.

The need for the continued use of recorders and a regular follow-up system was quickly demonstrated in the period after the coasting recorders had been removed. During these four weeks the energy requirements rose from 118 watt-hours per ton-mile to 157 watt-hours, so that for the last week of the period the energy saving over the original conditions was but 9.3 per cent.

Appreciable savings in brakeshoe wear were also made on the same line. Thus between April 13 and May 6, 1913, before the use of coasting clocks, five cars

averaged 22.4 lb. wear per 1000 miles; whereas four cars of the same type and in the same service, but equipped with coasting recorders, averaged only 13.5 lb. wear per 1000 miles between June 11 and June 22, 1913—a saving of 39.7 per cent. The money value of the brakeshoe saving was estimated at 3 cents per pound, which for 65 per cent wear of the shoes worked out at a saving of \$5,256 a year on the basis of 35,000 car-miles or 480 lb. shoe wear per day.

As the result of these tests on the West Eighth Street line, the company placed an order for 350 coasting recorders, enough to cover all the city and high-speed suburban lines. All cars were so equipped by May 31, 1914.

RECORDS AND FOLLOW-UP WORK

All records are in the hands of the efficiency department, which was organized originally as the coasting department when the clocks were installed; however, since November, 1914, the department has borne its present title. Its work, which is under the direction of U. S. Sliter, now embraces also traffic counts and analyses (including jitneys), transfer checking, cost of operating specific services and accident analyses.

The coasting tape records as taken from the clock show in order the number of the car, which is also that of the clock; the coasting minutes record, and the number of the motorman, an "E" being added to indicate an extra. In adding coasting time, a horizontal line is drawn across the tape for every hour, the number of coasting minutes being written in the hour space formed by the horizontal lines. This is done for convenience in making additions at the office of the efficiency department. The envelope for holding the tape differs from others in not bearing time-clock stamps. Instead the envelope carries the detail story of each run, including not only time on and off but also a record of all layovers and delays. Any delays exceeding three

minutes are taken into account in calculating the percentage of coasting minutes.

The records as taken from the coasting recorders are turned in daily to the district and division superintendents for inspection and they in turn forward them to the efficiency department. Coasting percentages are then computed by means of Burroughs listing and non-listing machines and a comptometer. These calculations are first made on a semi-monthly basis, line for line, but divided according to regulars and extras. These semi-monthly lists are posted conspicuously at the district and division headquarters concerned. Monthly lists are made up to show what percentage of men are making certain coasting records. These lists also show the record of the preceding month. Other monthly records are worked up into graphs which compare the northern, eastern, central and western districts of the traction division, also the Key division, according to their coasting averages and according to the average coasting on the system as a whole. Another set of graphs shows the coasting percentages and the average number of passengers carried per diem plotted against watt-hours per ton-mile and kilowatt-hours per car-mile.

Men whose coasting records are low are placed in the charge of a coasting instructor, who devotes an entire day to the delinquent. If necessary the treatment is repeated two or three times. On these occasions the motorman and conductor check the instructor to see that he is making all the time points correctly. The very next day the motorman is likely to do just as well as the instructor, and if he fails to keep this up it is evident that his backsliding is due to the fact that he is paying less attention to the refinements of operation. Generally speaking, about 90 per cent of the men have

OAKLAND COASTING—GRAPH DERIVED FROM COASTING TESTS AS DETAILED IN LOG SHEET

been thoroughly educated to the meaning of efficient coasting. Should a man prove incorrigible after repeated instruction, but be satisfactory otherwise, he is disciplined by being placed on the extra list or treated as a recruit motorman. Naturally an experienced motorman does not care to be seen in the rôle of a student who has to learn his lessons all over again. So far it has not been necessary to discharge one man because of poor coasting alone.

The progressive improvement in coasting is shown not only by the figures quoted, but by the fact that some 400 motormen are kept up to high coasting pitch with the aid of but one instructor. At first two coasting teachers were constantly engaged.

A large number of men had the impression that the best coasting records were to be obtained by allowing the car speed to die down and then jerking the controller handle over for a short spurt and so on repeatedly. Of course, this mode of operation is disagreeable to passengers, and it does not produce the best coasting records. The men are taught that the best results are

TABLE III—SAN FRANCISCO-OAKLAND TERMINAL RAILWAYS—CLASSIFICATION OF COASTING SKILL OF MOTORMEN

Coasting Percentage	PER CENT OF MOTORMEN ON				PER CENT MOTORMEN ON TRACTION DIVISION	
	Central District	Western District	Northern District	Eastern District	Period Ending May 31	Period Ending June 15
20 to 25	2.3	4.0	0.0	2.0	4.11	2.41
25 to 30	23.4	20.2	6.8	5.1	22.60	17.10
30 to 35	43.0	36.4	43.2	31.3	36.76	39.04
35 to 40	21.0	26.3	31.8	31.3	23.97	25.44
40 to 45	7.0	6.1	13.7	18.2	9.13	9.87
45 to 50	3.3	7.0	4.5	9.1	2.74	5.48
50 or Over	0.0	0.0	0.0	3.0	0.69	0.66

secured by accelerating and braking to maintain a uniform rate of speed and by anticipating stops so that the car will do part of the braking.

Hitherto the low and high-coasting men have met separately to discuss their records, but now joint meetings are held. A number of the high men have freely undertaken to show others how they obtain their records. The degree of coasting still shown by the men is presented in the accompanying classification by percentages.

COASTING BOGIES

Reference has already been made to the subdivision of coasting records by lines and classes of men. To afford a still fairer basis of comparison, the coasting instructor began about April 1, 1915, to work up a bogie or standard for each line instead of determining standards from the work of all men. In one instance the visit of the instructor on a certain line to make this determination spurred on the local motormen to improve their average coasting 5 per cent. This improvement was made within the two weeks that the instructor was making the tests.

Should a time-table be changed, the instructor rides all over the line again to establish a new standard if that appears necessary. However, the fact that there is often room for a little more efficiency appears from individual cases of time-table change. For example, when the running time between Oakland and Berkeley was cut from thirty-five minutes to thirty minutes, the coasting percentage showed a decrease until the instructor demonstrated that it was still possible to maintain the same ratio.

For certain reasons on another occasion the most rigid adherence to schedules was desired and this fact

gave some of the men the impression that they would have to do less coasting. The result of this wrong impression appears clearly in the graph showing the record of the Key division. In this case energy consumption went up from 3.25 kw.-hr. to 3.65 kw.-hr. per car-mile as the coasting went down from 42.8 per cent to 37 per cent between September, 1914, and January, 1915. To correct this condition a special coasting campaign was inaugurated and the instructor found that even with 40 per cent coasting the schedule could readily be maintained. The coasting on the Key division now averages 40 per cent or better.

In making coasting tests on the Key division, the instructor operated one-half of his time during the rush period. All delays incidental to operation were included in running time. A statement showing the result of these tests under date of May 17, 1915, gave the following standards for these lines:

Line	Per Cent	Line	Per Cent
Berkeley	34.40	Twelfth Street	51.98
Piedmont	36.27	Claremont	40.39
Twenty-second Street....	36.33	Northbrae	44.50
Average	40.07		

Although the company has maintained careful analyses of accidents by divisions, it did not begin until recently to check against the coasting records those accidents, like collisions and thrown passengers, which might be promoted by a too eager desire to coast. As yet there is no evidence to show that increased coasting has added to the number of accidents. It has been observed, however, that following the semi-annual selection of runs, accidents tend to go up until the men who have changed are accustomed to new conditions.

MAINTENANCE RECORDS

Clock troubles are recorded on a defect sheet similar to that shown on page 1200 of the June 26 issue. This sheet was devised by the Railway Improvement Company. During the first four months of 1915 the failures of clock mechanisms were respectively 30, 28, 31, and 20. Failures of printing mechanisms were 30, 23, 22 and 19, and other failures were 24, 27, 33 and 28. The average number of troubles per car per month were 0.248, 0.231, 0.254 and 0.198. One of the earlier

OAKLAND COASTING—THREE-DAY TEST SHOWING RESULT IN ENERGY CONSUMPTION OF HIGH COASTING AS COMPARED WITH LOW COASTING PERCENTAGE

OAKLAND COASTING—COMPARATIVE COASTING RECORD GRAPHS OF VARIOUS DISTRICTS OF THE TRACTION DIVISION AND OF THE KEY DIVISION

OAKLAND COASTING—RECORD OF TRACTION DIVISION WITH RELATION BETWEEN COASTING AND ENERGY CONSUMPTION

sources of trouble was in the piston and contact plates. This has been overcome largely by substituting grease for oil in the motorman's valve. Formerly, the oil from this valve would be blown through the air pipe into the relay box, thus causing poor contact in the armature. Another trouble, that of dirty mechanism causing slow clocks, was due to the entrance of dust into the clocks by way of the paper chute. However, this is not allowed to interfere with operation to any appreciable extent. Clocks reported slow are checked during a trial coasting period by means of a stop watch.

CHECKING WITH WATT-HOUR METERS

One feature in the education of the trainmen was the publication of the results of a three-day test when a low-coasting and a high-coasting motorman were checked by means of watt-hour meters. This test demonstrated conclusively that the man who did the most coasting was using the least energy, and that low coasters consume power to the value of \$1 to \$2 a day more than high coasters, even when energy is figured at but $1\frac{1}{8}$ cents per kilowatt-hour. The test, its results, and its purpose were placed before the trainmen in the following circular posted Nov. 11, 1914:

"To All Concerned:

"In order to determine the exact amount of power consumed by a motorman with a low-coasting record as compared with a man with a high-coasting record, we have caused a test to be made for a period of three days on the northern district. We have taken the same car, same run, which has made practically the same number of miles and handled the same number of people.

"We are posting these figures in order that the employees may study the results and be convinced beyond a question of doubt that the cost of power consumed in operating a car depends entirely upon the coasting record made, showing a three-days' test on Run No. 17, Richmond line, with a coasting record of 29.1 per cent.

	Coasting Per Cent	Kw.-hr.	Passengers	Miles	Cash
First day	29.0	615	598	116.16	\$33.40
Second day	28.7	576	592	116.16	33.15
Third day	29.8	639	496	116.16	27.80
Total	87.5	1830	1686	348.48	\$94.35
Average	29.1	610	562	116.16	31.45

"Showing a three-days' test on Run No. 17, Richmond line, with a record of 42.9 per cent.

	Coasting Per Cent	Kw.-hr.	Passengers	Miles	Cash
First day	44.3	423	589	116.16	\$33.85
Second day	36.4	469	472	116.16	26.95
Third day	47.9	588	509	116.16	30.10
Total	128.6	1486	1560	348.48	\$90.90
Average	42.9	495	526	116.16	30.30

"You will note that the man coasting 42.9 per cent of the time only consumes an average of 495 kw.-hr. as compared with the man coasting 29.1 per cent, consuming an average of 610 kw.-hr., making a difference of 115 kw.-hr. in favor of the man with the high-coasting record.

OAKLAND COASTING—RECORD OF KEY DIVISION WITH RELATION BETWEEN COASTING AND ENERGY CONSUMPTION

"Figuring the cost of the power at $1\frac{1}{8}$ cents per kilowatt-hour we find that the man with the low-coasting record costs \$1.29 more for power on a run of nine hours and twenty minutes, making an average of 116 miles per day, than the man with the high-coasting record. The average power consumed by the low man was 5.26 kw.-hr. per mile. The average power consumed by the high-coasting-record man was 4.25 kw.-hr. per mile.

"This shows that the high-coasting man operates his car under practically the same conditions as the low-coasting man with 0.991 kw.-hr. less per mile, or a little over 1 cent less per mile.

"Employees who read this bulletin and give a few seconds' thought will readily understand why this company is anxious to increase the coasting records of the low men. The low men are consuming too much power and costing all the way from \$1 to \$2 per run more for power than the high-coasting men.

"Your hearty co-operation is earnestly solicited. Men whose records are low are requested to give their full time and attention—concentrating their minds on the operation of their cars and increase their records.

(Signed)

"J. P. POTTER,

Superintendent of Transportation."

The result of the test described is also embodied in the graph reproduced on the opposite page.

CONCLUSION

The company, in viewing the advantages of its car recorders, naturally is gratified at the savings obtained. But it is still more gratified by the fact that the proper use of such devices produces better men. From an attitude of skepticism, the men have been converted to see in the recorder a device which makes their work lighter and more interesting in many ways.

Jovian Convention in Chicago

The thirteenth annual convention of the Jovian Order will be held at the Hotel Sherman, Chicago, Ill., Oct. 13, 14 and 15. The program outlined includes a reception and dance on the evening of Oct. 12. On Oct. 13 there will be a business session in the morning, luncheon as guests of business associations of Chicago, an outing trip in the afternoon and an elaborate pageant and entertainment in the evening. On Oct. 14 there will be a business session in the morning, degree team competition in the afternoon and the annual rejuvenation in the evening. On Oct. 15 there will be a business session in the morning, closing session and election of fourteenth congress in the afternoon and banquet in the evening.

Car Service Inspection in Seattle

Methods Followed by the Department of Public Utilities in Checking Car Loading and Blanks Used for Recording Data Are Described

BY J. W. MC CLOY, CAR SERVICE INSPECTOR DEPARTMENT OF PUBLIC UTILITIES, SEATTLE, WASH.

Practically all of the street railway franchise ordinances granted in Seattle contain the clause providing that cars shall be run over the various lines at such reasonable intervals between 6 a. m. and 12 o'clock midnight as the City Council may from time to time prescribe by ordinance. This, apparently, put within easy grasp of the Council the matter of adjusting street railway schedules to suit the public convenience, but in practice the authority so conferred was found difficult of enforcement from the fact that the Council had no adequate means at its disposal of determining just what a reasonable service would be. Furthermore, the obvious impossibility of a legislative body like a city council successfully attempting to assume so purely a managerial function as schedule making will be readily appreciated by those familiar with the constantly fluctuating demands of street railway service in a large city.

From time to time numerous and frequent complaints were made of the service, general and in particular, and although no serious attempts were ever made by the Council to assert its prerogative it was evident that some means of exercising the city's regulatory functions must be devised.

In April, 1908, the responsibility for the enforcement of franchise obligations was more clearly defined in an amendment to the city charter authorizing the appointment by the mayor of a superintendent of public utilities, and in perfecting the organization of the department thus created provision was made for the appointment of an inspector of car service.

The Alaska-Yukon-Pacific Exposition was held in Seattle during the summer of 1909, and realizing that abnormal travel conditions would be the rule during this event, the department confined its activities to service and equipment inspection of a general nature, and it was not until early in the following year that the problem of determining a standard of reasonable car service was seriously taken up. At the very outset a difficulty in the shape of an almost total lack of precedent presented itself. As far as could be learned there were no American cities where a definite standard of loading was prescribed or followed, and it was not thought advisable, in view of the excessive overcrowding which had characterized the travel on certain of the local lines and which had come to be looked upon as part of the regular order of things in all large American cities, to attempt to insist upon the standards of the municipally-owned European tramway systems. There arose the doubt as to what constituted excessive overcrowding, where the line was to be drawn between good service and bad, what the traveling public had the right to expect, and what the limit of good service was which would still permit the operating companies to make a reasonable return upon their investments. Such data as could be gathered from reports on traffic conditions in Eastern cities were of little value from the fact that the standard of loading was usually found to be higher than was deemed desirable to establish in Seattle.

Consequently it devolved upon the Department of Public Utilities to pioneer in the field of traffic regulation, and as a preliminary thereto an extended series of passenger checks was taken, covering particularly

the hours of heaviest travel and extending over a period of several months. In this manner data were secured from which it was possible to determine with a fair degree of accuracy the average number of passengers carried into and out of the downtown delivery district on each line and group of lines during the so-called rush hours. The department was then in a position to determine the characteristics of travel of the various lines and to make a critical analysis of the service.

The evening rush-hour period was interpreted to include that interval between 5 p. m. and 6.30 p. m. when the cars of the various lines were passing the points of maximum load on the way out of the downtown delivery district; the morning rush period varied considerably according to the class of patronage served, and different classifications were made to suit the varying characteristics of the different lines.

It was early decided to make no attempt to limit individual car loads but simply to prescribe a certain standard of service which would extend over the entire rush-hour period. Analysis of the service checks had shown that of the total number of passengers carried past the points of maximum load during the evening rush-hour period the number obliged to stand ranged all the way from 10 per cent on certain lines to as high as 45 per cent on others, with a number of routes on which the total number of seats furnished actually outnumbered the passengers carried. After careful consideration it was finally decided to fix the allowable overload at 25 per cent, in other words, to require a service which would supply sufficient cars on all of the most heavily traveled lines to provide seats for at least 75 per cent of the total number of passengers which would, under normal conditions, be carried past the points of maximum load. The inability to provide such a service on a certain few lines owing to physical conditions, such as grades, insufficient trackage, etc., was recognized, but in all its general particulars this idea has been followed ever since and, while refusing officially to recognize this principle as a standard, the largest of the local operating companies has tacitly agreed to accept the figures of the Department of Public Utilities and to increase its service whenever it can conclusively be shown that a maximum overload in excess of 25 per cent consistently exists.

How closely this standard of service has been observed can be gaged by the fact that prior to the December, 1914, holiday season the principal electric car lines of Seattle were on the average week-day evening between 5 p. m. and 6.30 p. m. hauling out of the downtown business district an average total of about 27,500 passengers, of whom 20,635, or just a fraction more than 75 per cent, secured seats.

The jitney invasion reached Seattle about the middle of December, 1914, and within six weeks had assumed such proportions as to reduce the street car travel by nearly 20 per cent, thus upsetting for the time being all of our carefully prepared statistics. In the face of this decrease in business the operating companies have continued to run practically the same service as before with the result that the percentage of passengers obliged to stand has been very materially reduced on all lines. Within the last few weeks, however, condi-

tions from a street railway standpoint have improved, and there is every evidence that within a short time the jitney bus, owing to regulative legislation and the pressure of the economic law, will have ceased to cut much of a figure in the local field of urban transportation.

As a general rule in securing traffic data all lines passing the point of maximum load are checked simultaneously, an actual count, in so far as it is possible, being made of the passengers. This is a practice which comes easily with experience, as the checkers are familiar with the seating capacity of the cars and have only to count the standing passengers in order to obtain very accurate results. From these data a report is made up on a form provided for this purpose showing the car number, time at which it passes the point of observation, the interval between cars, and the number of passengers. This is further summarized so as to show the average interval, weather condition, cars in service, total number of passengers, total number of seats and, finally, the percentage of passengers obliged to stand. Those lines which serve the same contiguous territory are grouped in preparing these reports.

Portions of a typical form used for recording these data are shown in the accompanying table. The group of lines reported is the Westport Avenue lines, of which there are six. After leaving the business district these six lines follow the same tracks for about 2 miles to the point where check is taken. From that point the lines pair off, serving various of Seattle's northern suburbs. The Union Street Loop, from which the Phinney Avenue and Green Lake cars, marked (X), are operated, is located about $\frac{3}{4}$ mile from the depot loop, the downtown terminus of all the lines. It is the intention to have these Union Street loop cars pull out immediately ahead of the through cars as they arrive at Union Street and pick up all passengers from that point out. In theory about one-half of the traffic originates beyond the Union Street loops. The summary shows how well this theory works out in actual practice.

This method of presenting the traffic count is preferred to the more generally practiced scheme of using a graphic chart for a number of reasons. To begin with, the numerical statement is considered more convincing and accurate, both in showing the load and the interval than any system which involves the use of the graphic curve. By showing the car number a definite record is made which is useful in the event of a dispute and also establishes the seating capacity. As many as six lines, all operating into the same general territory, can be shown on one form, and the effect of the travel on one line on the travel on another traversing and serving adjacent territory can be noted. Another advantage of the typewritten report is that duplicate copies can be made as desired. Duplicates of all traffic counts are furnished to the transportation department of the Puget Sound Traction, Light & Power Company, operating the majority of the Seattle lines, and the company's operating officials will testify to their value in assisting in the study of traffic conditions whereon to establish schedules.

Care is taken not to jump at conclusions or to follow first impressions in recommending improvements in the service. Whenever a check shows a certain line to be overcrowded an endeavor is made to ascertain the reason therefor. If the overload is an unusual occurrence on this line it is usually found that there is some extraordinary condition, not apt to be repeated, which is responsible. If, however, subsequent checks show a frequently recurring overload with no apparent cause excepting increase in travel, this line is closely studied for several weeks, and if the overload seems likely to

SERVICE AND EQUIPMENT INSPECTOR.									

FORM USED FOR RECORDING CAR LOADING AND SERVICE,
DEPARTMENT OF PUBLIC UTILITIES, SEATTLE

continue a demand is made for more service. The department is frequently able to point out that, while more service is needed during certain periods, a slight change in the schedule, using the cars to a better advantage, will afford the necessary relief without the necessity of adding more cars.

Early in the study of car-service inspection it became apparent that the one thing above all others to be sought for in the operation of the cars was regularity. It was very evident that an irregular headway resulted in the excessive overcrowding of certain trips, while others immediately following would scarcely have their seats filled. It has therefore been the aim of the Department of Public Utilities to assist by every means possible in securing an uninterrupted operation of the cars. To this end several ordinances have been passed making it a misdemeanor for teamsters or others willfully or carelessly to interfere with the expeditious operation of the cars. While conditions are still far from being entirely satisfactory in this respect, substantial progress has been made and better results are looked for in the future.

Union Traction Safety Magazine

The Author Tells How the Publication of This Magazine Has Been of Assistance to the Various Safety Committees

BY E. E. SLICK, CLAIM ADJUSTER UNION TRACTION COMPANY OF INDIANA, ANDERSON, IND.

Demand for an organ of communication among the company's employees to improve esprit de corps and encourage enthusiasm in the safety movement was met by publishing the Union Traction Company of Indiana's magazine *Safety*. The first issue of this magazine appeared in April and contained twelve pages, including the cover. The Union Traction Company has one of the

FRONT COVER OF SAFETY MAGAZINE

oldest safety organizations in the country, having been organized in May, 1912, and the safety magazine is really an outgrowth of the demand for closer relations between the various local safety committees. The headquarters of these committees are established at five terminals on this company's lines and each committee consists of sixteen members. These members are taken from all departments of the road and serve for a period of six months. Each committee holds monthly

meetings, and the chairman and secretary of the local committees meet with the general board once each month. The general board is composed of all department heads, who serve permanently.

At the March meeting of the general safety board it was decided that an organ of communication among the employees devoted to the subject of safety and other matters of common interest was necessary. Accordingly the claim adjuster, who was secretary of the board, was appointed editor, and plans were immediately perfected so that the first issue of *Safety* appeared early in April. Interest in the safety movement has been kept up from the beginning, but through the medium of the magazine additional enthusiasm among employees has been encouraged.

All articles are furnished by department heads and employees generally, and every article deals with some phase of the safety movement or welfare work, directly or indirectly. Each issue is well illustrated, particular attention being given to portraits and biographies of old and faithful employees and the local safety boards. The editor being the secretary of the general safety board is in close contact with the work of the local as well as the general organizations. The magazine is distributed free to all employees through department heads, and the expense of its issuance has been amply justified by the increased interest in safety and welfare work.

Handling Troop Trains in Iowa

Inter Urban Railway of Des Moines Meets Severe Test in Carrying Troops from Their Various Headquarters to the State Encampment

Recently the electrical equipment and the transportation department of the Inter Urban Railway of Des Moines, Iowa, were put to a severe test when it was called upon to move 3500 Iowa troops over a section of its line. The troops arrived in cars containing fifty or sixty men, or in trains containing from 200 to 500 men. The contract to move them from the steam road connection to the place of encampment was obtained only by the transportation department's agreeing to move troops as fast as they arrived. Consequently all trains were special and during the period the troops were being transported regular service, which provides for a one-hour-and-fifteen-minute schedule, was operated without any delays. At the steam road connection considerable time was consumed in transferring the men and their baggage. The total time required, however, to move the 3500 men and their baggage was five hours. The troops were handled in trains of from one to twelve cars each and the movement from the connection to the place of encampment was 25 miles.

In connection with the handling of these troops it is interesting to note that one train of twelve steam road passenger cars arrived at the connection. To eliminate transferring, the entire train was delivered to the electric road. One of the company's electric engines was coupled to this train and moved it over the road and up grades averaging about 1 per cent without delaying regular service. A view of this train and the electric engine is shown in the accompanying illustration. On the return trip at the close of the encampment, the same electric locomotive moved a train of fourteen cars, and the maximum ascending grade in this direction was 3 per cent. These electric engines are equipped with four GE-207-D, 110-hp., 600-1200-volt motors and Type M control. The total weight of the locomotive is about 55 tons and the effective tractive effort at 160 amp. input is 3700 lb.

VIEW OF TWELVE-CAR TROOP TRAIN, DES MOINES INTERURBAN RAILWAY

COMMUNICATIONS

Contact System Nomenclature

McHENRY & MURRAY, ENGINEERS

NEW HAVEN, CONN., Aug. 10, 1915.

To the Editors:

Referring to the editorial on "New Technical Terms in Heavy Electric Traction," which appeared in the issue of the ELECTRIC RAILWAY JOURNAL for Aug. 7, I would offer the following suggestions regarding conductors and collectors in electric railway service:

Classification of Elements of Contact System.

Contact Conductors

Contact wire.

Contact rail—"Third-rail."

Contact Collectors

Contact trolleys—"Trolleys."

Contact rollers.

Contact shoes—"Sliders."

Contact shoes may be further classified under—

"Engine shoes."

"Motor-car shoes."

"Pantagraph shoes."

The suggested classification at least has the merit of uniformity.

The term "trolley wire" is certainly inapplicable when sliding shoes are used for making contact, and the term "contact wire" which may be more generally applied and is in common use upon the New Haven system, seems to be altogether better. It is improbable, however, that the suggested terms "contact rail" and "contact trolleys" will displace the older and better established names "third-rail" and "trolleys." The trolley-wheel form of contact is so narrowly limited to this particular use as to make unnecessary a further descriptive prefix, but it is believed that the term "contact shoes" will be considered preferable to the term "sliders" and will secure universal acceptance.

The writer confesses to a prejudice in favor of the older form of spelling "pantagraph," as preferred by the lexicographers.

E. H. McHENRY.

Nominal Rating of Railway Motors

GENERAL ELECTRIC COMPANY

SCHENECTADY, N. Y., Aug. 6, 1915.

To the Editors:

Now that the committee on standards of the American Institute of Electrical Engineers has reached a decision on the subject of rating railway substation machinery, and has issued the new rules, I wish to express my belief that the committee acted most wisely in retaining in the rules the so-called "nominal rating" for railway apparatus. One of the strongest reasons for retaining this rating, in my mind, is the fact that the nominal rating, involving the two-hour overload after a continuous run, has been in general use in this country for many years, is well understood by railway engineers and operating men generally, and has been entirely satisfactory in the vast majority of cases. The proposition to eliminate this form of rating and substitute a single continuous rating has, so far as I know, arisen within the institute and not from any general dissatisfaction with the existing rating.

I most thoroughly indorse the excellent work of the standards committee of the institute and sympathize heartily with their attitude as respects the simplification of ratings. At the same time I have been much impressed with the opportunity for the institute to

solidify and extend its prestige in the railway industry generally by recognizing in its standardization rules the established good practice in the art.

It is a debatable question as to how far the institute should endeavor to create new engineering methods through the medium of its standardization rules. I think that we should assume a progressive attitude in formulating these rules, but it is not the medium through which we should endeavor to create radically new engineering practices. The open forum of the institute is the proper place to present and discuss new ideas, theories and practices. The standardization rules, it seems to me, should be the crystallization of the best practice of the times, with the supreme object of receiving general approval and adoption in practical work.

There are many situations in which the continuous rating is preferable and, if the general practice can in course of time be brought around to the exclusive use of the continuous rating, it will be most appropriate for the institute to then discontinue the recognition of the nominal rating. The rules as issued recognize either the flat, continuous rating or the nominal rating, and in this respect, as in substantially all other essential matters, appeal to me as being in excellent practical shape and should be left unchanged for a considerable period so they may be digested and assimilated into the regular commercial channels of the industry.

W. A. Del Mar, in his communication printed on page 21 of the issue of the ELECTRIC RAILWAY JOURNAL for July 3, advocates the continuous rating to the exclusion of the nominal rating, but at the same time proposes that a special specification be prepared for every individual case in which there would appear not only the continuous rating, which represents the energy-dissipating ability of the machine, but also some expression representing the thermal capacity. It is entirely conceivable that for every situation there is an ideal relation between continuous capacity, short-time capacity and momentary capacity, and it is also possible with complete knowledge of the railway service to express these different requirements in a specification in each individual case. Railway engineers who are familiar with the industry will realize, however, that this would be practically very difficult if not impossible. The capacity of railway motors for rolling stock is determined in this way, but this is a relatively simple problem as compared to a similar method for substation apparatus because the load or duty on railway motors is not subject to a great deal of change after the initial determination. If it were possible to specify the exact railway service and exactly to match the service requirements as to continuous and overload capacity when the substations were installed, the requirements undoubtedly would be modified so radically, as the business of the railway company increased or when its lines were extended, as to make the apparatus unfit unless a large factor of safety were applied in the first instance. It would, moreover, be manifestly very undesirable to impose upon the manufacturers the great variety of converter, generator and transformer specifications that such a scheme would entail. This would tend to make all machines special and vitally affect the cost and deliveries. The attempt to use such an ideal scheme would in a short time, I believe, evolve a general rating which would probably be expressed in terms very similar to, if not identical with, the present nominal rating, which does take care of continuous capacity, short-time overload capacity and momentary maximum capacity.

While the present nominal rating may not accurately represent the duty in every particular case it does in a

general way define those characteristics of the apparatus which are important and makes it possible to compare different machines in a way that represents their ability to meet the service for which they are intended.

G. H. HILL, Assistant Engineer,
Railway and Traction Department.

Girder and High T-Rail Renewals

DETROIT, MICH., Aug. 7, 1915.

To the Editors:

The article on girder and high T-rail renewals in the *ELECTRIC RAILWAY JOURNAL* of July 31 was of unusual interest. One year ago my assistants and I wrote letters to the chief or maintenance engineers of steam roads with whom we were acquainted and asked for the limit of wear, or the life of rails, in their practice. On these roads the traffic and management differ widely. Extracts from the answers to our letters follow:

Union Pacific.—“On main track, on main lines, the wear on the head of 80-lb. and 90-lb. A.S.C.E. and A.R.A. open-hearth rail when released is seldom more than $\frac{1}{8}$ in. At this time it has carried 100,000,000 tons of traffic, but there are many other factors, such as threatened breaking down of the head, excessive batter at joints and the development of defects of various kinds in increasing number as the rail gets older. On tangents, the wear on the side of the head is usually a negligible quantity.”

M. K. & T.—“In main-line service using 75-lb. A.S.C.E. sections, the limit of wear is not more than $\frac{1}{4}$ in., or about 15 per cent of head area.”

Missouri Pacific.—“On main lines we allow from 4 16-in. to 5 16-in. vertical rail head-wear, by measurement directly over the inside line of the web. On branch lines, 6 16-in. wear is permitted.”

Rock Island.—“Have considered that when 10 per cent of the rail, or 25 per cent to 30 per cent of the head area, is worn, the rail should be scrapped. This may not be definite but is representative.”

A. T. & S. F.—“We generally replace main-line tangent A.S.C.E. rails when they are worn about $\frac{1}{4}$ in. from flange wear.”

Michigan Central.—“In most cases, main-line rail is not renewed on account of a worn head, its life being generally determined by the battering of the ends at joints. Our rail-saw foreman advises that $\frac{7}{64}$ in. is the average amount that our 100-lb. rails, taken from the main track, are worn down when they are turned in for sawing before relaying on branch lines.”

Grand Trunk.—“We permit our 70-lb. to 90-lb. rails to wear on the heads about $\frac{1}{8}$ in. before removing them from main lines to side tracks.”

In the appraisal of electric railway properties, the railographs of the actual wear of the rail head show the following:

On interurban lines in high-speed service, the wear at the flange side of the rail head is as great and is as important as the wear on the top of the rail head. Flange wear at the middle of the rail is usually greater than at the ends.

On city lines in low-speed service with standard 7-in., 91-lb. T-rail and welded joints, the wear on the head of the rail is much greater than the gage side, therefore wear on the head of the rail determines the life. In a comparison on the basis of service, a rail which is well worn may be safe for low-speed service and not safe for high-speed service.

In a comparison on the basis of height of rail, a careful examination of 7-in. and 9-in. rails with continuous joints and with about the same sectional area in the base and in the head and under the same traffic shows

that the surface bend, caused by low joints, is much less in the 7-in. than in the 9-in. rail. The reason for this is not clear to the writer although it is the usual cause for renewals.

The wear of rail heads is not proportional to years of wear but to car traffic, particularly since automobiles have become common for trucking. Data are much needed on the number of million tons of ordinary double-truck car traffic which will wear out the rail head of common 7-in., 91-lb. T-rail, when laid with welded joints.

The writer, after making thousands of railographs and after long experience in track construction and renewals and in track appraisals, holds to the following:

1. Rail heads of modern 7-in., 91-lb. T-rail with welded joints, laid on broken stone or on concrete ballast, on tangent level track, can be worn to 50 per cent of the rail-head area with safety.

2. Common concrete ballast with 8 in. of concrete surrounding the ties, in paved streets, lasts twice as long as the rail.

3. Common oak ties buried in concrete, on paved streets, will last thirty to thirty-six years.

4. Economy of operation demands that advantage be taken of the above three facts in planning future renewal of rails, ballast and ties.

EDWARD P. BURCH, Consulting Engineer.

Hand-Brake Pressures

OFFICE OF ALBERT S. RICHEY, ELECTRIC RAILWAY
ENGINEER

WORCESTER, MASS., July 29, 1915.

To the Editors:

One may be led astray in trying to compare the formulas corresponding to Figs. 3 and 1 in the instructive and valuable article by Mr. Horne on page 67 of the *ELECTRIC RAILWAY JOURNAL* for July 10, 1915, in the manner suggested in that article. The following study gives a comparison of the total available truck-rod tensions resulting from a given hand-brake rod tension applied to each of the systems illustrated by Figs. 1 and

Fig. 1

Fig. 3

BRAKE RIGGINGS WITH FLOATING AND PIVOTED LEVERS
RESPECTIVELY

3, respectively. In the original article the ratio between the length h and the length g in Fig. 3 is one-half the ratio of h to g in Fig. 1. The distances between the truck rods and between the hand-brake rod and the truck rods are respectively the same in both figures. Therefore, if the two systems are to be compared, it is necessary to give the lengths their true values. To accomplish this it is convenient to express the length h in Fig. 3 in terms of h in Fig. 1. This gives the true value $h/2$, which should be instead of h in connection

with Fig. 3. This has been indicated on the accompanying drawings reproduced from the article but with the change suggested.

If now the hand-brake rod tension X be applied to the system shown by Fig. 3, we have the equation of equilibrium

$$X \left(g + \frac{h}{2} \right) = P_f \left(\frac{h}{2} \right) + P_r \left(\frac{h}{2} \right) \quad (1)$$

from which the sum of the tensions in the truck rods is

$$P_f + P_r = \frac{X (2g + h)}{h} \quad (2)$$

Considering now the system shown by Fig. 1. The tension X in the hand-brake rod will give the tension in the front truck rod

$$P_f = \frac{Xg}{h} \quad (3)$$

and in the rear truck rod

$$P_r = \frac{X(g + h)}{h} \quad (4)$$

Adding equations (3) and (4), the sum of the tensions in the front and rear truck rods is

$$P_f + P_r = \frac{Xg}{h} + \frac{X(g + h)}{h} \quad (5)$$

$$= \frac{X(2g + h)}{h} \quad (6)$$

The right-hand members of equations (6) and (2) are equal, therefore a given tension applied to the hand-brake rod will produce the same total truck-rod tension in the systems shown by Figs. 3 and 1.

WILLIAM C. GREENOUGH.

[NOTE.—A copy of Mr. Greenough's letter was sent to Mr. Horne, who replied as below.—EDS.]

LORD MANUFACTURING COMPANY

NEW YORK, Aug. 12, 1915.

To the Editors:

I think that Mr. Greenough's points are very well taken and that perhaps my explanation of the formulas might have been more clearly set forth. However, the data contained in the article referred to are absolutely correct, but I find upon going over the entire matter that my illustrations may have been somewhat misleading, and I am sure it was the illustrations that led Mr. Greenough astray when perusing the article.

The figures illustrating the article were taken from the Lord Manufacturing Company's "Hand-Brake Bulletin" and, as the illustrations were on different pages of the bulletin, it was not noted that the dimension h shown in Figs. 1 and 3 was not made to the same scale. Assuming that the dimension h is equal for both of the types of brake rigging shown, the formulas contained in the article on hand-brake pressures will be found to be correct.

L. W. HORNE, General Manager.

Safety Commission at Portland, Ore.

Portland, Ore., has one of the most representative "safety" commissions in this country. The chairman is H. P. Coffin, an active member of the Automobile Club of Portland and an indefatigable worker for safety. The other members are as follows: B. F. Boynton, claim agent Portland Railway, Light & Power Company; John T. Moore, captain of police and chairman of the bureau of the city in charge of traffic; B. F. Dowell, chief of the fire department; Jay Stevens, fire marshal, who has personally delivered a number of lectures during the past year to the school children on safety; H. E.

Thomas, city editor *Oregonian*; R. L. Withrow, *Evening Telegram*; Marshall N. Dana, *Oregon Daily Journal*; L. R. Alderman, superintendent of schools; A. S. Kirkpatrick, city traffic engineer, who has installed about 500 warning signs in various parts of the city, drawing the attention of the drivers of vehicles to conditions ahead; Guy Talbot, president Pacific Power & Light Company; F. L. Burkhalter, general superintendent at Portland of the Southern Pacific Railway and chairman of the committee of safety in transportation; A. M. Churchill, a prominent attorney, and A. H. Averill, a well-known merchant.

Southern California Committees

The southern California committees, the headquarters of which are 794 Pacific Electric Building, Los Angeles, are getting together on a plan of entertainment for the delegates of the American and Manufacturers' Associations to the convention. While no definite plans for entertainment have yet been made, the general plans have been discussed and the following organization is in charge: General chairman, J. McMillan, Pacific Electric Railway; secretary-treasurer, K. E. Van Kuran, Westinghouse Electric & Manufacturing Company, and the following committee chairmen: Finance, Paul Shoup, Pacific Electric Railway; San Diego entertainment, B. M. Warner, San Diego Electric Railway; reception, Seymour Swarts, Great Western Smelting & Refining Company; publicity, D. W. Pontius, Pacific Electric Railway; program, R. H. Husbands, Pierson-Roeding Company; club courtesies, C. A. Henderson, Los Angeles Railway; transportation, A. W. Arlin, General Electric Company; barbecue and music, L. O. Lieber, Los Angeles Railway; evening entertainment, S. I. Wailes, manufacturers' agent; Catalina trip, F. F. Small, Pacific Electric Railway, and San Francisco registration, H. H. Hale, Galena Signal Oil Company.

There is very great interest in the coming of the visitors in Los Angeles, Pasadena and San Diego. The southern California railway men are also planning for a special train to San Francisco, with provision for the comfort and convenience of the delegates from this section.

Joint Order by New York Commissions

For the first time in the history of the Public Service Commissions of New York State a joint order was adopted during the week ended Aug. 7 at a joint meeting of the two commissions. Commissioner J. Sergeant Cram acted as chairman of the commission for the First District, while Chairman Seymour Van Santvoord was presiding for the second district. The joint order provides for the removal of grade crossings and other obstructions on the lines of the New York & Harlem Railroad (New York Central) and the New York, New Haven & Hartford Railroad near 241st Street in The Bronx. It also orders a shifting of the tracks and the construction of a viaduct to carry the street, so that present dangerous and inconvenient conditions will be done away with and the full effect of recent grade-crossing improvements in Mount Vernon will be enjoyed. Mount Vernon is in the second district, and the improvements there were ordered some time ago by the second district commission, but owing to conditions in New York City, just south of the Mount Vernon line, the new highway there could not be used until a connection from the New York City end was provided, and the joint order adopted during the week is to bring about the completion of the improvement on the New York City side.

Trolley Wheels of 10-In. Diameter

BY F. A. MILLER, SUPERINTENDENT POWER AND EQUIPMENT
OAKLAND, ANTIOCH & EASTERN RAILWAY

On Sept. 3, 1913, the Oakland, Antioch & Eastern Railway commenced to operate trains between Oakland and Sacramento, Cal., a distance of 85 miles. This distance is covered in from two hours and forty-five minutes to three hours; from nine to eleven minutes of this time is taken by the train ferry, 38 miles from Oakland. Direct current at 1200 volts is used, and each motor car is equipped with four 120-hp. motors, Westinghouse Type 322-E, two trolleys of the ordinary type and a pantograph collector for operation over the lines of the San Francisco-Oakland Terminal Railways. Figs. 1 and 2 show the appearance of the cars with trolley up over the pantograph and with the trolley down and the pantograph up.

The trolley wheel first in use was the No. 4 Kalamazoo. This size gave trouble at the very start. During September and October more than 50 per cent of delays due to car defects were caused by trolley wheels and poles. While trains were crossing on the ferry the trolley wheels would be changed, and in the case of limited trains they had to be changed again at Sacramento. Even then many wheels were lost because the arcing was so severe that the pins would be burnt off. Of course, the wheels became very rough. In particular, where the old type of overhead construction was used, they would jump off the trolley wire a great deal, damaging the overhead, bending trolley poles and causing other trouble common to trolley operation.

On Oct. 2, 1913, the first of the 10-in. trolley wheels was placed in service on car No. 1011. This was exactly like the No. 4 Kalamazoo except for the larger diameter. A trolley harp of the Kalamazoo type was made to take this large wheel. The same contact springs, washers, bushing and $\frac{5}{8}$ -in. pin were used as for the No. 4 wheel, so that if the large wheel should be lost on the road the small one could be installed. Up to Nov. 6, 1913, Car No. 1011 had made more than 5200 miles and it was evident from an inspection at that time that the bushing would outwear the wheel. Other wheels installed have a similar history. Since

Nov. 1, 1913, trolleys and trolley poles have caused 5 per cent of the delays chargeable to car defects, and to present a trolley defect is almost unknown.

Fig. 3 shows a 10-in. wheel and harp. Figs. 4 and 5 show a 10-in. wheel which has been worn through after the car on which it had been installed had run 5600 miles. The bushing shows very little sign of wear. The wheel weighs $10\frac{1}{2}$ lb. and operates on a tension of 35 lb. 21 ft. above the rail; the harp is made of manganese

A 10-IN. TROLLEY WHEEL—FIGS. 3, 4 AND 5—THE 10-IN. WHEEL NEW AND AFTER 5600 MILES OF SERVICE

bronze. The price of the wheel is \$3.20 f.o.b. Oakland complete with bushing, and the price of the harp is \$1.20. The ordinary car oil used to lubricate the wheels seems to be of just about the right consistency for this work. The most noticeable difference in the operation of these two sizes of wheel is the absence of arcing with the larger one. The wheels have a very smooth appearance after having made the mileage stated, and present operating conditions show an average life of 6500 trolley-wheel miles.

At the present time bus lines have been installed so that one trolley can supply more than one motor car, and one trolley is used on five-car trains consisting of two motor cars and three trailers on a maximum grade

of 4.6 per cent. Under these conditions one wheel collects as high as 900 amp. continuously for thirty minutes and 450 amp. continuously for one and one-half hours, there being no noticeable heating until 1200 amp. has been reached.

Train Resistance of Electric Cars at Starting

BY D. D. EWING, ASSISTANT PROFESSOR OF ELECTRICAL ENGINEERING PURDUE UNIVERSITY, LAFAYETTE, IND.

A vast amount of experimental work has been done and much has been published on the general subject of train resistance. There is not, however, a great deal of published material available on the subject of train resistance of electric cars at starting. Some interesting data on the subject have been obtained during the past year by means of the Purdue University test car which has the dimensions and equipment, as shown in Table I.

As this car is not in regular service it is, no doubt, "stiffer" than one which works the usual daily mileage, and the starting-resistance values obtained are higher than those to be ordinarily expected. The tests are to be continued on cars in regular service. The results of the present tests are of interest for comparison with running resistance for the same car and with such few starting resistance data as are available.

To determine the effect of track characteristics on starting resistance, tests were made on sections of track having different characteristics. These characteristics are tabulated in Table II.

The average super-elevation of the outer rail of track "C" was $3\frac{1}{8}$ in. The minus sign before the per cent grade for track "C" indicates that the grade was a descending one for forward motion of the car. The alignment of the rails was good but not first class.

Two different methods of determination were used. In the first, or current-tractive effort method, the starting resistance was determined by measuring the motor current that was just sufficient to perceptibly move the car and then, from the performance curves of the motors, finding the tractive effort which corresponded with this current. The motor performance curves had been determined in a previous test. In making the starting resistance tests the motor current was increased very gradually until the car started to move, by decreasing the resistance of a water rheostat which was connected in series with the motors.

In the second method the external force applied at the drawbar, which was just sufficient to start the car, was measured by a traction dynamometer. This force was applied by means of a windlass. The dynamometer

used was calibrated by checking its readings against those of an Olsen testing machine.

In both methods of determination the car was moved alternately forward and backward over the test sections of track. As the current or force was always a maximum the instant before the car started to move, in taking readings it was only necessary to note the maximum current or force exerted during the starting period.

A summary of the test data is given in Table III.

The tests were not all made on the same day, but they were made under similar weather conditions and, as may be seen in the column of Table III headed, "Air Temperature," the temperature of the air for the different tests was approximately the same.

Two different bearing conditions are recorded in Table III. In all of the tests the wheels were turned over a sufficient number of times to insure a film of lubricant between bearing materials, but in the third group of tests the car was operated for a sufficient length of time to bring the bearings up to the condition which they might be expected to have after an extended run.

Under the heading, "Total Applied Force," the minimum and maximum observed values as well as the average of the observed values are recorded. The variations in the applied force seemed to be caused largely by faults in the rail alignment, the minimum values obtaining when the car was started with one or more wheels moving down into a depression and the maximum values obtaining when the wheels were moved out of the depression. The great majority of the observations gave results which were very close to the calculated average.

The force in pounds per ton of car weight was calculated by dividing the total applied force by the weight of the car.

The figures in the last column of Table III were found by taking the arithmetical average of the averages for forward and backward motion of the car.

Comparing the results obtained by the two methods it will be noted that the results agree very well for straight level track. In general, for the data which are comparable, the dynamometer method gave slightly higher values than the current-tractive effort method. This is as it should be, since the tractive effort which was read from the motor performance curves was computed from the torque of the motor as measured at the motor shaft, and, therefore, did not include the tractive effort necessary to overcome the motor journal and brush friction.

Some measurements were made with the dynamometer with the car on track "C," but they were not very satisfactory as it was difficult to keep the direction of

TABLE I—DIMENSIONS AND EQUIPMENT OF TEST CAR

TABLE II—TRACK CHARACTERISTICS

Track Section	Ballast	Tie Spacing, In.	Average Grade, Per Cent	Average Degrees Curvature
A	Concrete	24	0.00	0.00
B	Dirt (well settled)	24	0.00	0.00
C	Cinders	20	-0.25	17.50
Weight of rail				60 lb.

TABLE III—SUMMARY OF DATA

Method	Number of Observations	Track Section	Direction of Motion	Air Temperature	Condition Bearings	Total Applied Force			Force, Pounds per Ton			Force, Pounds per Ton Average Both Directions
						Min.	Avg.	Max.	Min.	Avg.	Max.	
Current-tractive	47	"A"	Forward	72	Cold	660	990	1190	25	37	44	38
Current-tractive	59	"A"	Backward	72	Cold	740	1060	1340	27	39	42	
Dynamometer	106	"A"	Forward	75	Cold	840	1050	1320	31	39	49	39.5
Dynamometer	60	"A"	Backward	65	Cold	840	1070	1350	31	40	50	
Current-tractive	9	"A"	Forward	72	Warm	760	860	1000	28	32	37	36
Current-tractive	27	"A"	Backward	72	Warm	790	1100	1300	29	41	48	
Current-tractive	20	"B"	Forward	70	Cold	860	1020	1200	32	38	44	38.5
Current-tractive	20	"B"	Backward	70	Cold	940	1060	1400	35	39	52	
Dynamometer	50	"B"	Forward	70	Cold	800	1100	1480	30	41	54	40.5
Dynamometer	50	"B"	Backward	70	Cold	800	1070	1120	30	40	42	
Current-tractive	20	"C"	Forward	70	Cold	900	1200	1580	33	44	58	47
Current-tractive	20	"C"	Backward	70	Cold	1150	1340	1540	43	50	57	

the moving force parallel to the car axis and so they were not recorded in the summary. However, the data thus secured seemed to indicate that on curved track the dynamometer method gave lower values of starting force than the current-tractive effort method, although the values of starting force thus secured were, as might be expected, higher than for straight track. The fact that with driven wheels on a curve there is greater tendency for the wheels to climb the outer rail than with trailing wheels may explain the reason for the lower values of starting force secured with the dynamometer method in the curved-track tests. With the exception of the second group of dynamometer tests the results indicate that a larger starting force was required for the backward direction of car motion than for the forward direction. No satisfactory explanation was found for this difference. If the current-tractive effort method only had given such results the difference might have been attributed to the motor-brush settings. As far as the past history of the car is concerned, it has been operated as much in one direction as in the other and therefore unequal wear of the gearing as a cause for the difference seems to be out of the question.

With the bearings warm, the average value of the starting force for both directions of car motion was lower than for bearings cold, other conditions being similar. Also the average value for the starting force in the backward direction was slightly higher than for the same direction of car motion over the same track with bearings cold. The difference is not great, however, and as fewer observations were taken with the bearings warm there is greater chance of the difference being due to observational errors.

The dirt ballast of track "B" was well settled and as the ground was dry the track was almost as rigid as track "A." Both methods of determination gave slightly larger starting forces for track "B" than for track "A."
